The district is well adapted to every purpose of a mining camp, being easy of access, and having many natural facilities and abundance of ore.

Except at a few of the highest locations in the district, the snow never accumulates to a depth to interfere with mining operations, the temperature very seldom falls as low as zero and work could be conducted without interruption throughout the entire year.

Darrington, Wash., March 28th, '99.

Spokesman-Review: At the Lone Pine, Republic, a new shaft is to be started and sunk 500 feet. This will be the first deep shaft in the camp.——An assay of 3 feet of quartz on the Insurgent gave a value of $63.45 per ton in gold. The quartz in all of the ledges appears to be of the same character.——A new shaft on the Gopher at Republic has discovered a large vein of ore 18 feet from the surface.——The Agnes shaft at Republic is 60 feet deep, a crosscut will be run to the vein.——The Standard has a tunnel in 40 feet. There are 3 feet of quartz in the face. The shaft is down 75 feet. The tunnel is being run for drainage and ventilation. It will be driven 50 feet to the bottom of the shaft.——The shaft on the Rebate at Republic is being sunk with three shifts, it follows the foot wall and the vein has not been crosscut. Within 30 feet of the surface it was 11 feet

wide.——Three shifts are working on the Tom Thumb shaft. It is 140 feet deep. No ore is being taken out.

WYOMING.

Laramie *Republican*: Extensive work will be done upon the Heidrich mines, in Jelm mountain district, the coming summer. Last September an agent of the Rothschilds secured a bond upon the prospects for $15,000.

FOREIGN.

BRITISH COLUMBIA.

What is said to be the biggest ore contract ever made in Rossland is reported between the War Eagle Con. M. & D. Co. and the Canadian Smelting Works at Trail. The agreement is to run for two years, during which time a minimum of 300,000 tons of ore is to be shipped, which will amount to a gross value of $10,000,000. It is expected that the shipments will amount to not less than 500,000 tons, however, which will be worth over $16,000,000. At present prices the ore will net $14 per ton. The rate at which the contract was taken is said to be approximately $6 per ton. The smelter at Trail, now owned and operated by the Canadian Pacific Railway, was built by F. A. Heinze of Butte, Mont., when he secured the contract to smelt 75,000 tons of the Le Roi ore. He received about $11 per ton on that contract, being a rate much higher than that specified in the present instance. Heretofore the smelter at Trail has confined its operations largely to handling gold-copper ores. During the past year, however, it has expended considerable in improvements, and has added a furnace for the treatment of silver-lead ores of the Slocan district. The entire output of the Rossland district, with the exception of the Le Roi mine, is treated at Trail. The Le Roi product is being treated at the plant owned by the company at Northport, Wash.

It is generally understood at Sandon that all the mines will close down as soon as the eight-hour law goes into effect. The intention of the mine owners is to pay the men off and close down until some arrangement can be made with the men whereby they will accept $3 per day for the eight-hour day, instead of $3 50 as formerly for ten hours.

The Rambler & Cariboo G. & S. M. Co. will pay at its office in Kasio a dividend of 1 cent per share. This is the third dividend of the company, but the first in many months. It means the addition of the Rambler to the list of dividend payers in the Slocan. For the present dividends will be 1 cent per share monthly.

A gold bearing quartz vein is reported as occurring near the water front of the city of Victoria, some of the rock assaying $32 per ton.

The mine owners of southern Kootenay have reason to believe that the miners will insist upon the eight-hour day and the same rate of wages as was formerly paid for ten hours, and this they say means a general shut down of the mines until cheaper men can be secured.

Two carloads of ore shipped from the Bosun, at New Denver, Sunday, make 340 tons this year, and upwards of 700 tons since the property was purchased.

The cross vein in the main tunnel of the Marion is 4 feet wide, with ore scattered through it.

The Payne M. Co., Ltd., has purchased the Telephone claim, three-quarters from M. R. W. Rathbourne and the remaining quarter from P. Burns. It adjoins the Two Jacks of the Payne group.

The total ore treated by the Dundee mill at Ymir is 750 tons.

As to the Tamarac mine, 200,000 shares of treasury stock have been sold in England at 19½ cents per share, making a sum of $39,000 placed to the credit of the company for development work.

On the Little Cariboo in Camp McKinney a drift is being run at a depth of 55 feet from the shaft to crosscut the vein. The shaft is 60 feet deep and passed through the vein some time since and the crosscut is now being run back to catch the ledge.

The tunnel on the Shannon-Dolphin was approaching the vein. Another vein lying below the one for which the tunnel is being driven has been stripped for over 100 feet. A shaft has been started.

Work has started on the Fontenoy, Camp McKinney, under the direction of the Dunsmuir syndicate of Victoria. They will continue the shaft, which was already 80 feet deep on the vein. The claim is to be equipped with machinery.

Spokesman-Review: The recent strike on the Neepawa, Ten Mille, was made 150 feet deep on a ledge parallel to the Enterprise. Between 700 and 800 feet of tunnel work has been done.——The winze being sunk near the mouth of the No. 2 tunnel on the Bosun, near New Denver, after going through 15 or 20 feet of broken ledge matter, is in the ledge firm and solid and of greater width than any of the upper workings. Work on the No. 3 tunnel is going ahead. The opening will tap the ore body 150 feet lower than No. 2. Forty tons were shipped from the mine Sunday, making 300 tons since the 1st of January.——The Payne mine shipped 470 tons last week. Other shippers were the Queen Bess with 226 tons and Last Chance 140. Shipments for the week reached 1049 tons.——Two and a half miles north of Greenwood, in Providence camp, is the Combination claim, one of the early locations of the camp. Last fall the shaft was continued to a depth of 65 feet, when it was decided to run a crosscut tunnel to tap this ledge at depth. A contract was let to run 300 feet; it is now into the hill 86 feet. The contract will be finished with Burleigh drills. The rock in the tunnel is hard black lime, only a foot a day being made by two shifts.

Spokane *Chronicle*: A large ore body is being developed in the Velvet mine, on Sophie mountain, at Rossland. The ore body is now blocked out 273 feet long, 160 high and 10 to 20 feet in width. The shaft is down 240 feet. Two steam drills are now being put in. The new 60 H. P. boiler is in position.——A controlling interest in the Giant mine at Rossland has been bought by Montreal capitalists. It is believed the new owners will resume development. The Giant is situated outside the city limits of Rossland. Two large veins have been opened on the property, one running east and west and the other north and south. A shaft has been sunk on the east and west vein 115 feet. A 35-foot shaft has been sunk on the other ledge and a 120-foot tunnel run.

CANADA.

Superior *Telegram*: A revival in mining matters is taking place at Port Arthur, particularly in silver.——The Golden Star M. Co., in the Seine River district, has paid a second dividend of 1%. March 20th it was voted to pay a third dividend of 1% April 15th.——The Sawbill district on the upper Seine river is tributary to Port Arthur, via Bonheur, 130 miles west. There the Hammond reef is located, 500 feet wide, with a 10-stamp mill and thirty more decided upon. The Sawbill mine has ten stamps and a main shaft down 250 feet. There are fifty freight teams employed between Bonheur and the mines, thirty and forty miles inland.

LOWER CALIFORNIA.

A French syndicate is operating a group of copper mines near Santa Rosalie. They own a line of steamers for transportation of their product and employ a large number of men.

Personal.

HENRY P. LOWE, of Denver is in New York City.

A. A. BLOW, M. E., is on his way from London to Denver, Colo.

M. B. Silver of San Francisco has returned from Sonora, Mexico.

J. COPELAND is operating the Gold Bluff mine at Downieville.

AUGUSTE MATTHES, M. E., has returned to Denver from Arizona.

THEO. B. COMSTOCK of Tucson, Arizona, reached London, March 20th.

G. AARONS of Australia is in Colorado to investigate various mining districts.

F. W. WILMANS, Supt. of the Bonanza mine at Sonora, Cal., is in San Francisco.

W. T. CORNWALL, representing the Denver Fire Clay Co., has returned from Mexico.

H. R. AYERS has been appointed Supt. of the Compania Industrial at Chihuahua, Mexico.

R. A. PARKER of San Francisco, Cal., expects to return from Boston, Mass., about May 1st.

A. R. WILFLEY, inventor of the Wilfley concentrator, is visiting the Comstock, Virginia City, Nev.

JAS. W. NESMITH, Pres. Colorado Iron Works Co., has returned to Denver from the City of Mexico.

F. ROBB has gone from the Anchor concentrator to take charge of the Daly-West mill at Park City, Utah.

JACK CARR, an Alaskan mail carrier, has broken the record from Dawson to Skaguay, coming out in ten days.

VAN F. FURMAN has returned from a European trip and has an office in the Boston building, Denver, Colo.

W. J. MILLER, former Mgr. Denver Engineering Works Co., recently returned to Denver, Colo., from the East.

JOS. MCGILLIVRAY, a veteran California miner, has returned from the Klondike. He walked out from Dawson.

J. L. JOSEPH, Supt. of the Gerrymander mine at Sonora, Cal., has returned to the mine from San Francisco.

J. G. FORRESTER has returned to the Bullion-Beck Champion mill, after an absence of two years, and will again be in charge.

W. S. WARD of Denver, Colo., has been appointed Colorado's representative of mines and metallurgy at the Paris Exposition.

L. CHEVRILLON of New York is examining the White Cloud copper mining property near Lovelock, Nev., for prospective Eastern buyers.

DR. WOODRUFF, Pres. Tuscarora Chief M. Co., Tuscarora, Nev., is in San Francisco buying mining machinery, including a cyanide plant.

JOHN W. MACKAY nas been inspecting the Allison Ranch mine, near Grass Valley, Cal. Mr. Mackay is president of the Allison Ranch Co., and P. Kerwin Supt. at the mine.

FRANKLIN FARRELL, present Pres. and Mgr. Parrot Copper M. Co., is about to take charge of the new Arizona copper property, the United Verde Extension M. Co. at Jerome.

JAS. W. NEILL is the Mgr. of the $10,000,000 U. S. M. Co., recently organized at Salt Lake City, Utah, to operate in Bingham, Utah. It cost $2508 to file the articles of incorporation.

R. C. TURNER, until recently Supt. of the Excelsior mine near Sugar Pine, Tuolumne Co., Cal., has accepted a position as Supt. of the Plumas Development Co.'s property at La Porte.

SENATOR PERKINS of California and Senator Fairbanks, president American organization of the high joint commission, will go to the head of Lynn canal, Alaska, next month to investigate the boundary question.

JOHN E. PHILLIPS of Denver and Cripple Creek recently made a trip to Silver City, N. M., and secured an option on a group of properties adjoining the Santa Rita mines. He reports the possibility of a sale of the latter to an active company.

Industrial Notes.

—Hay is $55 per ton at Ballarat, Cal.

—Lumber demand has advanced in the Hawaiian islands, and coast prices likewise.

—The receipts of the U. S. Government for March exceeded expenditures $13,721,224.

—Eureka, Cal., is shipping redwood lumber direct to Honolulu, U. S. A., and Melbourne, Australia.

—At Santa Cruz, Cal., the Big Creek Co. has ordered an additional electric plant, sufficient to furnish 275 more H. P. than at present, making a total H. P. of 675.

—The Southern Pacific Co. has reduced the wages of its section men in northern California. They now get 16 cents per hour for eight hours per day, five days per week.

—The February earnings and expenses of the Santa Fe Ry. Co. show the proportion of operating expenses was 61%; proportion for the eight months of the fiscal year is still high.

—An auxiliary pipe 42 inches in diameter will be included in the plans and specifications for the Cedar river, Seattle, Wash., water supply system, increasing the total cost of construction $125,000.

—Hereafter the S. F. & S. J. V. R. R., the Southern California R. R. and the Santa Fe Pacific R. R. will be known as the Santa Fe Pacific Co., including the mileage west of Albuquerque, N. M.—1750 miles.

—At Sacramento, Cal., the Sacramento E. G. & Ry. Co. has made a thirty-year contract with the Yuba E. P. Co. for the exclusive use of 5000 H. P. to be delivered at the power house of the former company.

—At Buffalo, N. Y., last Saturday, every employe of the Buffalo Smelting Works, the local branch of the Calumet & Hecla M. Co., received an envelope containing a bonus of 10% of the wages earned during the last year.

—At Seattle, Wash., W. B. Baker has conveyed to the Snoqualmie Falls Power Co. all the property acquired by Mr. Baker in the establishment of the big power plant at Snoqualmie Falls. The revenue tax on the deed was $1000.

—The General Electric Co. has entered suit in the U. S. Circuit Court at Los Angeles against the San Joaquin Electric Co. of Fresno, Cal., to recover apparatus valued at $90,000, and $10,000 which it claims to have lost through the action of the defendant company.

—The San Francisco establishment of Miller, Sloss & Scott, the largest hardware concern on the Pacific coast, was almost destroyed by fire on the night of the 31st ult., involving a loss of $250,000, insured. On the following day they bought out the firm of Hawley Bros., corner Beale and Market Sts., San Francisco, and at once resumed business.

—The Sunset P., M. & M. Co, Skykomish river, Snohomish county, Wash., will install an electric power plant to supply power for an electric railroad, twelve miles long, for manufacturing purposes at Index, and for lighting purposes at Snohomish and Everett. The head works and central location of the new power company are at Sunset Falls. N. Rudebeck of Everett is Sec'y.

—Leon Sloss, of San Francisco, has obtained the contract for carrying the mails from San Francisco via Ounalaska, St. Michael and all points along the Yukon to Circle City and Dawson, 4408 miles, and back, three round trips, sailing from San Francisco about June 1, June 20 and July 5. The contract is not to be required to carry more than five tons of mail matter each way on any one trip.

—A telegraph line from Skaguay to Dawson will be constructed by the Canadian Government this season. The construction party, in charge of F. Richardson, assistant electrician of the Canadian Pacific, left Ottawa to begin work March 4th. The distance of the proposed line is 600 miles; estimated cost $250 a mile, or a total of $150,000. It is expected that the line will be in operation by Nov. 15th, '99.

—The Oxnard-Hamilton beet sugar properties, which include factories at Chino and Hueneme, Cal., and Grand Island, Neb., have been sold to a corporation organized under the laws of New Jersey, capitalized at $1,000,000. The Clark factory at Los Alamitos, Cal., is not included. It represents an investment of $1,000,000. Present indications are that the beet lands of the Los Angeles section will net a two-thirds yield. Upon this basis the Chino factory will handle 66,000 tons, the Hueneme 75,000 and the Los Alamitos 50,000. The Clark factory will turn out approximately eighty tons of refined white sugar daily, or a trainload for the market each twenty-four hours.

—The Formosan Government has asked for an appropriation of $20,000,000 for the construction of a railway through the island, and for the improvement of Kelung harbor. The Japanese cabinet has given its approval, and as a railway and harbor are urgently needed, it is believed the diet will pass the bill. There is at present in the island a railway sixty miles long, running from Kelung to Teckcham (Hsinchik). It was commenced in 1887, and was completed in 1891. It was owned by the Chinese Government, but on the taking over of the island by the Japanese it passed into the possession of the latter Government. The proposed railway will extend south from Teckcham to Takow, a distance of 175 miles.

—The last California Legislature passed an act authorizing the Governor to appoint three commissioners—one from the central, one from the northern and one from the southern part of the State—to constitute the California Paris Exposition Commission, not more than two members of which shall belong to the same political party. This commission is to have exclusive charge of the expenditure of the $130,000 appropriated by the act for the purpose of collecting, forwarding and maintaining an exhibition of California products at the Paris Exposition in 1900, and for preparing and distributing suitable literature descriptive of the State and its resources, industries and capabilities; also, for the purpose of returning exhibits to the State. The commissioners are required to give bonds to the amount of $10,000 each. They must be experienced in exposition work, and shall be allowed for their services $5000 each and actual traveling expenses. Certified vouchers are required to be returned to the Controller for all expenditures by the commission. The act takes effect immediately, but $105,000 of the sum appropriated will not be available until Dec. 1st, '99.

—Pacific ocean soundings are to be made by the United States steamship Ranger, from Guam to Manila, to supplement those already made from the United States and Hawaii to Guam. The course to be covered is about 6000 miles, with deep sea soundings taken at ten-mile intervals. These soundings will be made with a detachable sinker and No. 11 piano wire; this wire is .03 inch in diameter, has a breaking strain of a little over 200 pounds, and it weighs 1.3 pounds to the 100 fathoms, or about thirteen pounds to the mile. The sounding machine used automatically registers the fathoms paid out, and has a reel run by steam with a capacity of 600 fathoms of wire. The sounding rod, invented by Capt. Sigsbee, is a brass tube 10 inches long and 2¼ inches outside diameter, passing freely through a globular iron casting weighing sixty pounds. The sinker is held on the tube by a catch and loop, and when bottom is struck the lower part of the tube is forced into the mud until the sinker rests on the bottom; the catch is then released, and the released tension on the sounding wire is at once recorded on the hoisting machine. The wire is then pulled in, with the tube and sample of bottom, leaving the sinker behind it. As rises of temperature above 70° may affect the gutta percha insulation of cables, it is important to obtain the temperature at great depths. This is done by a mercury thermometer with a cylindrical bulb and straight stem, protected from pressure by being hermetically sealed in a strong glass tube. This thermometer is pivoted with a tendency to upset, and in descending the mercury bulb is down and is kept there by the pressure of a small threaded rod surmounted by a propeller. Just above the bulb the stem is contracted and slightly flattened with a kind of S bend. When the sounding weight strikes the bottom the lifting of the wire reverses the action of the propeller, releases the thermometer, and the latter tumbles bulb up. This reversal breaks the mercury column at the contraction, and the mercury already in the stem falls to the bottom, and, expanding it, records the same temperature existing at the time of reversal and preserves this record until the thermometer is set for a new observation. The upsetting of the thermometer also releases valves in the top and bottom of metal cups attached to the thermometer and admits samples of the deep sea water.

Catalogues.

MANY of the catalogues now issued by large manufacturing concerns are of superior practical value to treatises written for the same class of readers and charged for. From such a catalogue can often be secured more practical information than is sometimes contained in a pretentious book sold at a stated price. While still styled "catalogues," many of these trade publications are really of great value, the advertising being merely incidental. In the last two years have been received in this office hundreds of "catalogues," superbly printed, elaborately illustrated and replete with up-to-date information, technical data on the subject they represent to such an extent as to really make the advertising part of it a "bye-product." Of such a class is Catalogue No. 5, from the Gates Iron Works, 650 Elston Ave., Chicago, which, treating the topic of "Crushing Rolls," manages to give so much information on that manner of crusher that any one wanting to know about crushing rolls could probably do better to ask for a copy of such a catalogue to be sent to his address than to pay for a technical work on that subject. And this may in general be said of a large number of trade "catalogues," of which the one referred to is a type. If the manufacturers of mining machinery continue to issue such fine specimens of typography, which compare favorably in style and finish with the best magazine work, and fill their pages with valuable technical details, they will trench upon the business and occupation of the mutable many who have been writing text-books on mining and metallurgical matters. It has now got to the point that, in place of leaving it to the office boy, as was the style fifteen years ago, the business of preparing and issuing the sumptuous work of modern art known as the "catalogue" is now usually delegated to the smartest man in the establishment. Several firms in San Francisco, Denver, Chicago and elsewhere have of late years issued "catalogues" of mining machinery that have cost thousands of doliars, and which treat of every conceivable form of mining. Some of them constitute veritable text-books on practical gold milling, the different processes, the most economical methods, valuable tables and technical matter, mostly furnished gratis to any one sending his address, though in some cases a small charge is made; this to head off the "collector" of catalogues, for there are collectors of catalogues, as well as collectors of stamps, autographs, etc. About the first thing the average compiler of a good book on mining and milling now needs is to get a good assortment of "catalogues." These and a file of the MINING AND SCIENTIFIC PRESS gives him all the necessary data. The rest is merely a question of composition, printing, binding and paper. The labor involved in the

preparation of a large trade catalogue is considerable. To such an extent has the catalogue issuance grown that a big mining manufacturing concern usually issues a series, each one of which treats on a different subject. One—the Risdon of San Francisco—has issued the 17th; of such a series, Fraser & Chalmer's latest is No. 53; Denver, Colo., firms and those of other places have also issued a large number. Still, even these are excelled in quantity by the electric companies. The latest one received from the Westinghouse Electric Co. was No. 209.

Commercial Paragraphs.

HENSHAW, BULKLEY & Co. of San Francisco, have a contract to put a $25,000 pumping plant in Honolulu, to daily deliver 5,000,000 gallons.

THE Gates Iron Works recently shipped machinery for a 75-ton concentrating mill to Silverton, Colo., for the Boston & Silverton M. Co.

PHILIP SCHUCH JR. has organized the Standard Gold Extraction Co. of Cripple Creek, Colo. It is the purpose of the company to erect reduction works.

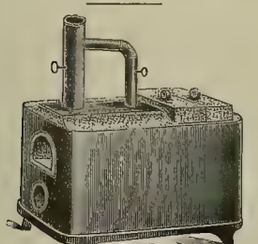
JOHN S. WORTHINGTON & Co. of Denver, Colo., now represent Park Bros. & Co., Limited, steel and copper manufacturers, of Pittsburgh, Pa.; also A. Leschen & Sons' Wire Rope Co.

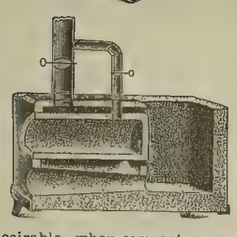
THE Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., recently shipped six Norwalk air compressors to Cripple Creek district, being two to the Ajax, one each to the Mary McKinney, Isabella, Anchoria-Leland and Tornado mines.

JEAN F. WEBB & SON, until recently residents of California, have opened an office in the Boston Bldg., Denver, Colo., for the purpose of introducing the pneumatic cyanide process for gold extraction, of which they are patentees. They have perfected patents from the governments of the United States, South African Republic, New Zealand and Australia.

ALMARIN B. PAUL of San Francisco has been appointed special agent by the Gold & Silver Extraction Co. of America, Ltd., for the MacArthur-Forrest Cyanide Process for California north of, and including, Mono, Madera and Merced counties. Mr. Paul was the first to introduce the process in California and Nevada and worked it on a large practical scale, and with success, giving his results to the mining world through the MINING AND SCIENTIFIC PRESS. For a time Mr. Paul controlled a large territory in California and Nevada; but some differences coming up between him and the company respecting royalty, Mr. Paul withdrew. Recently the company and Mr. Paul have come together again. It is understood that there is now a very material reduction from when Mr. Paul first had it, to such an extent as to justify a revival in that line. His office is room 27, Crocker building, San Francisco.

A New Assay Furnace.



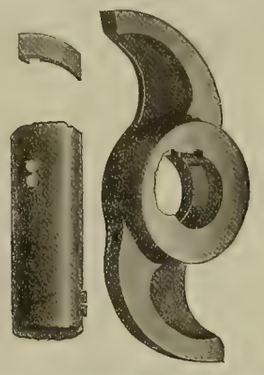


It is desirable, when compactness and economy of fuel is an important consideration, for the assayer or prospector to have his assay furnace as self-contained, portable and convenient as possible. To meet this demand Messrs. Wm. Hoskins & Co. have put on the market combination furnaces, on the latest of which, illustrated above, letters patent were granted Feb. 7th, this year, an illustrated description of which appeared on page 179 of the issue of Feb. 18th, '99.

This furnace has the advantage of a cold crucible introduced into the crucible chamber, and which in no way interferes with work in progress in the muffle. It utilizes the surplus heat both in the muffle chamber and the crucible chamber, yet both sections of the furnace are independently and positively heated. The gases and air are so thoroughly mixed in the combustion chamber, which, it will be noticed, is tapered, that crucibles in the crucible chamber are uniformly heated, avoiding the tendency to crack, due to a direct application of the blast. Gold may easily be melted in the crucible chamber while cupellation or scorification is going on in the muffle. This furnace is made in two sizes. For further particulars write the manufacturers, Messrs. Wm. Hoskins & Co., No. 81 South Clark street, Chicago, or apply to any of the dealers in assayers' and chemists' supplies.

Canda Self-Locking Cam.

The Canda improved self-locking cam for stamp mills is shown in the accompanying illustration. The device consists of fitting into the bore of the ordinary stamp cam an eccentric wedge chamber, such as can be formed by the continuous revolution of a boring tool, this chamber occupying only a portion of the width of the eye of the cam, of a circular wedge key within this chamber and a slot or recess in both key and the cam, to enable the studs or projections on the cam shaft to engage the wedge key and hold it in position. These cams, by reason of the position of the studs on the cam shaft, are interchangeable; each of the series of cams will take any one of the angular positions as determined by these



studs. This feature is deemed important, as when breakages occur the delays incident to the stopping of mills, cutting keyseats, removing cams from shaft, etc., are reduced to a minimum. The fastening is also essentially self-tightening under a working load, will not work loose, and mills are not forced to stop to key up cams, as is often the case when the ordinary tapered key is used. Nor is dependence placed in the shearing stress as with the ordinary key, for the circular eccentric wedge takes hold upon the shaft, and the studs are thereby relieved of the major portion of the shearing stress to which they would otherwise be subjected.

It may be pointed out that the frictional adhesion between the shaft and the concentric face of the circular wedge is so great that the wedge may be said to be practically in compression. The cams may, however, be readily loosened by striking the arm a slight blow on the reverse side. The introduction of this fastening does not affect the strength of the cam, as the full width of the hub is retained; nor is the hub subjected to strains all out of proportion to the work to be done, as often occurs where the ordinary driving key is used.

Of the apparent advantages noted above, none, however, are more important than the feature of being readily adjusted to the ordinary existing cam shaft. This fitting may be done by hand, if necessary, with a ratchet drill, after which the studs may be driven into place. It is not necessary to procure a shaft of any special type, nor are any special machines or tools required to bore the cams; all the machine work may be done on an ordinary lathe or boring mill. This fastening may also be applied to gears, pulleys, etc., and, in fact, to all parts of machines that rotate under load in one direction. The cams are manufactured by the Chrome Steel Works, Brooklyn, N. Y. H. D. Morris Co., 143 First street, San Francisco, are the local agents.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 28, 1899.

622.108.—VEHICLE POLE—F. M. Bird, Wenatchee, Wash.
621,998.—DRAWING STEAM BEER—Farley & Jackson, S. F.
621,914.—BOOT HEEL—Ford & Starr, S. F.
621,920.—BATH TUB—F. Johnson, Seattle, Wash.
622,156.—HONEY EXTRACTOR—A. Kuschel, S. F.
622 053.—THAWING APPARATUS—J. W. Livermore, Selma, Cal.
621,836.—CAR COUPLING—J. J. Malloy, Portland, Or.
622,188.—LAMP SOCKET—M. Meyberg, Los Angeles, Cal.
622,074.—BOTTLE STOPPER—C. V. B. Reeder, Evergreen, Cal.
621,945.—TOY HORSE—F. Ritter, Portland, Or.
622,021.—VIOLIN—R. & E. Sample, Los Angeles, Cal.
621,862.—CAR NUMBERS—H. J. Small, Sacramento, Cal.
621,863.—PRINTING TELEGRAPH—S. J. Small, Seattle, Wash.
621,880.—WHIFFLETREE—H. E. Westly, Spokane, Wash.
621,985.—AMALGAMATOR—G. W. Williams, Payette, Idaho.
621,986.—CONCENTRATOR—G. W. Williams, Payette, Idaho.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Recent Mining Incorporations.

Chloride-Bailey G. M. Co., San Francisco; capital stock $500,000, all subscribed; H. Wilson, O. O. Howard Jr., H. G. Dodds, R. R. Bigelow, F. E. Ware.

Altamont M. Co., San Francisco; capital stock $500,000, subscribed $62,000; W. P. and W. G. Scott, Soulsbyville; T. A. Fisher, P. H. Reardon, J. C. Doherty, San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR DRAWING STEAM BEER.—Frank E. Farley and John H. Jackson, San Francisco, Cal. No. 621,998. Dated March 28, 1899. This invention relates to a device for drawing effervescent liquids and separating therefrom the carbonic acid gas so that the liquid can be drawn in a comparatively solid form without too much foam. It consists essentially of a closed casing having a discharge faucet or draw-off cock at the lower end and a pipe connecting this casing with the cask or reservoir containing the liquid to be drawn. Through this pipe the liquid charged with gas is brought into the upper part of the casing and delivered upon a divergent distributing plate over which it passes and thence it is delivered to pass through a series of screen surfaces interposed between the reception and the delivery pipes. This separates the liquid from the gas to such an extent that the liquid can be drawn from the lower faucet with no more gas than is requisite to give it the required sharpness.

AMALGAMATOR.—Geo. W. Williams, of Payette, Idaho, assignor to the Williams Concentrator and Amalgamation Co. No. 621,985. Dated March 28, 1899. The object of this invention is to so construct an amalgamator that it will bring all the particles of fine valuable metal, amalgam or floured quicksilver intimately and continuously in contact with the mercury and concentrate the particles thus gathered to a point from which they are easily collected. It consists essentially of an inclined suspended pipe having a connection whereby a vertical oscillation is given to the lower end and a horizontal oscillatory motion to the upper end. A feed pipe delivers the material to be acted upon into the lower end of the pipe, where it comes in contact with mercury, and it rises gradually through the inclined pipe to be discharged at the upper end, the shaking motion forming a most complete separation of the finer from the heavier and more valuable particles.

CONCENTRATOR.—Geo. W. Williams, of Payette, Idaho, assignor to the Williams Concentrator and Amalgamation Co. No. 621,986. Dated March 28, 1899. This invention consists of a combination of screens with blanket, eider-down cloth so arranged with relation to each other that a large number of small openings are formed in which the fine gold black sand can reach the eider-down cloth and be retained thereby, while the peculiar disposition of the screens with relation to each other causes an undertow or current passing below the meshes of the screen rather than an overflow in the manner of ordinary riffles.

Recently Declared Mining Dividends.

Bunker Hill & Sullivan M. & C. Co., Idaho, April 1, $21,000; April 4.

Rambler & Cariboo G. & S. M. Co., Slocan, B. C., 1 cent per share.

Republic mine, Washington, $35,000; payable April 15.

Sacramento M. Co., Salt Lake, Utah, ½ cent, $5000; April 2. Total to date $87,000.

Boston & Colorado Smelting Co., regularly quarterly dividend 1½%; April 1.

Pennsylvania M. Co., Grass Valley, Cal., 5 cents per share, regular monthly dividend.

Anaconda M. Co., Montana, $1.25 per share, $1,500,000; payable May 3.

A MINING DETECTIVE.—"Confidential," operating in California, Arizona and Colorado. I am prepared to investigate as to habits of employes on duty (also off duty) in mine and mill, particularly the art of stealing gold specimens, amalgam, ores, etc., from mining companies. Best of references. Reasonable terms. Address "Confidential," M. & S. P. Office, San Francisco, Cal.

Side-Dumping Ore Car,

THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

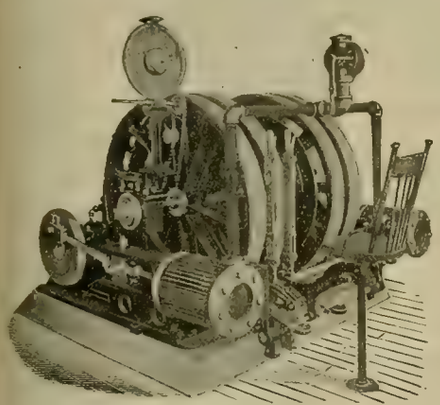
We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

WHATEVER IS POPULAR DESERVES ATTENTION.--THACKERAY.



10 x 12 LIGHTNING QUADRUPLE FRICTION HOIST.

Unquestionably the Most Popular Friction Hoist in the Market is the

...BOLTHOFF...

Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

COMPLETE HOISTING OUTFITS CARRIED IN STOCK.

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 180 pages, illustrated....$1

ASSAYING:—PARTS II & III—GOLD AND SILVER BULLION, LEAD, COPPER, TIN, ETC.
Latest edition; 161 pages, illustrated, cloth. Much of the original text replaced by new matter.....$1 75

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast.....$2

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated.....$5

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50c

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

ALLOYS:

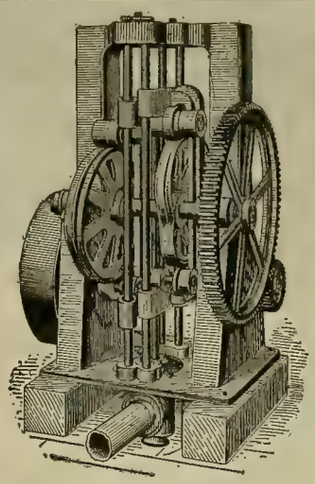
501-505 N. Main St., LOS ANGELES, CAL.



Our 12-in. Duplex Deep Well Pump, 4 ft. 4 in. high, weighs 1000 lbs.

Our Triumph Duplex Deep Well Pump

differs from all others in these particulars: It throws a continuous, unbroken stream without pulsation, vibration, water hammer, air chamber, counter balance, or fly wheel. It has no dead centers or cranks. All work comes on the lift stroke, moving vertically on the center line. We need no anchor bolts with our pumps. Requires less power. Is a perfect pump.

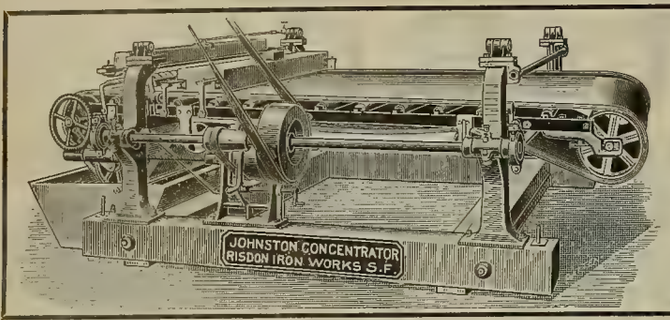
Lacy Manufacturing Co., Office, Room 4, Baker Block, LOS ANGELES.

RECEIVED FIRST PREMIUM.

THE MAIT DRY GOLD SAVER

Received first prize at Agricultural Fair 1897 in Los Angeles over some dozen competitors, and has been used in southern California in various mining districts with success. The materials used for the construction are of the best. It is well bolted (not nailed) and screwed together. The woodwork is of spruce and poplar; castings, iron and brass; linings, galvanized iron, heavy quality; riffle screen, No. 70 mesh, brass wire; hopper screen, ¾-inch mesh, well secured; fans, galvanized iron, neatly painted and well varnished. It can be easily taken apart and packed, convenient for shipping to any part of the country. If you are interested investigate by writing us for prices and our illustrated descriptive circulars. Address

WM. H. HOEGEE, 140 S. MAIN ST., LOS ANGELES, CAL.



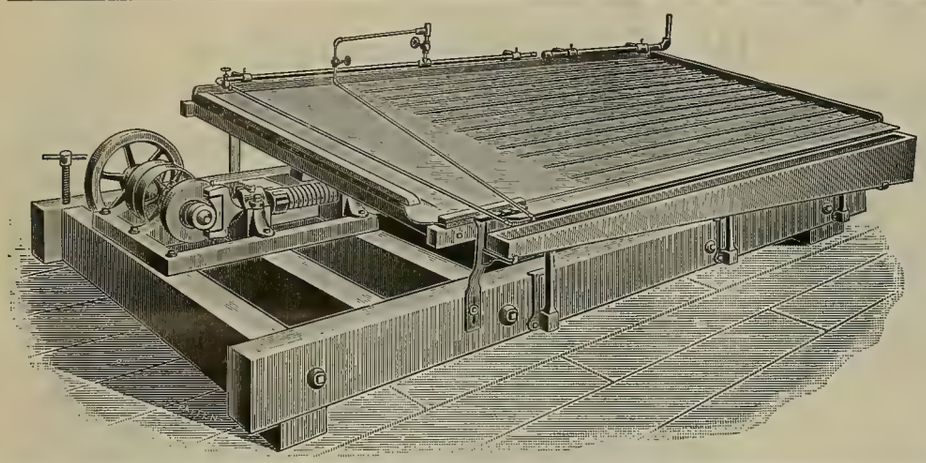
THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6 ft. Johnston doing the work of two 4-ft. belt machines.

Send for Catalog No. 14. RISDON IRON WORKS, Howard and Beale Sts. San Francisco, Cal., U. S. A.



WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

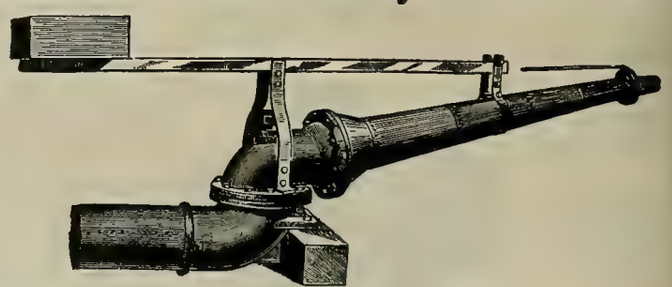
P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

PARAFFINE PAINT CO., San Francisco, 116 Battery St.

Double-Jointed Ball-Bearing Hydraulic Giants.



The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

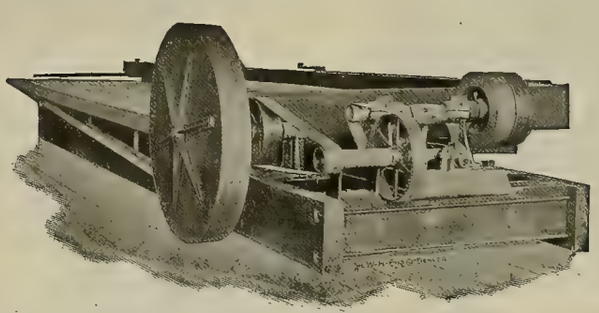
WHITE, ROGERS & CO.,
Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

A Small Sinker AT A Small Cost.

THE
MOORE SINKING PUMP.

1500 Gallons per hour.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.
Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.
Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far **do not show any wear either on the Guides or the Stems.** They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. **It is our intention to replace all of our Guides with those of your make,** and I cheerfully recommend them to any one desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

Books Received.

Second Edition Chemical and Metallurgical Hand-Book; 336 pages of boiled-down information for chemists, metallurgists and mining engineers, by J. H. Cremer, M. E., and G. H. Bicknell, M. S., of Cleveland, Ohio; devoid of advertising, excellently bound in flexible leatherette, and conveniently indexed. In its scope and arrangement the work is worthy of recommendation. It is designed largely for workers in and with iron and steel, but contains much of general value to the mining world. The tables are more than ordinarily elaborate and complete. Price $3, postpaid.

"*Prospecting, Locating and Valuing Mines.*" A practical treatise for the use of prospectors, investors and mining men generally; with an account of the principal minerals and country rocks; ore deposits; locations and patents; the early development of mines; earthy mineral products; coal; gold gravels and gravel mining; measurement of water and artesian wells; with fifteen plates. By R. H. Stretch, E. M. The Scientific Publishing Co., 253 Broadway, New York. Published in two styles: library, cloth, 12mo., $2; pocket, 16mo., flexible cover and special paper, $2.50. The book contains 380 pages, and has considerably more of value than is ordinarily found in a work of that class. The author does not seem desirous of airing his own knowledge but presents for fair consideration a good many things sometimes lost sight of, carefully and justly avoiding the discussion of themes that usually yield nothing but ultimate dissent or disagreement. There is very little discussion, a good practical compilation of facts and correct statement of conditions. It shows careful editing, and sufficient knowledge of the subjects discussed to make it of value.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage, MONEY loaned, mines, MINING companies organized, their property exported, financed and managed, MINES, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated, EXAMINE mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of March, 1899, an assessment (No. 17) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of April, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh (7th) day of March, 1899, an assessment (No. 66) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth (10th) day of April, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the second (2nd) day of May, 1899, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33 Nevada Block, No. 309 Montgomery street, San Francisco, California.

HEAD CENTRE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tombstone Mining District, Cochise County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1899, an assessment (No. 7) of twenty (20) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of May, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

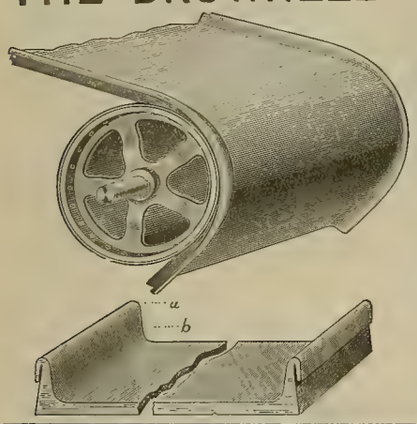
DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

CALIFORNIA WIRE WORKS, - 330 Market St., San Francisco, Cal.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation.
Gives THREE CONCENTRATES on the one Machine at the same operation.
The Machine is especially adapted to the separation of Zinc and Lead.

SIZE OF MACHINE.....4 ft. by 8 ft.
WEIGHT.....1000 Lbs.
CAPACITY.....10 to 30 tons per 24 hours.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

THREE CLASSES OF MACHINES ARE MADE.

Table A is adapted to concentration from 2 into 1 to 8 into 1.
Table B, 6 into 1 to 16 into 1.
Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs. or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

Price of the Table $300 Complete, f. o. b. Cars, San Francisco, Cal.

Licensee for the Manufacture and Sale, **PARKE & LACY CO.,** 21 & 23 FREMONT STREET, San Francisco, Cal.

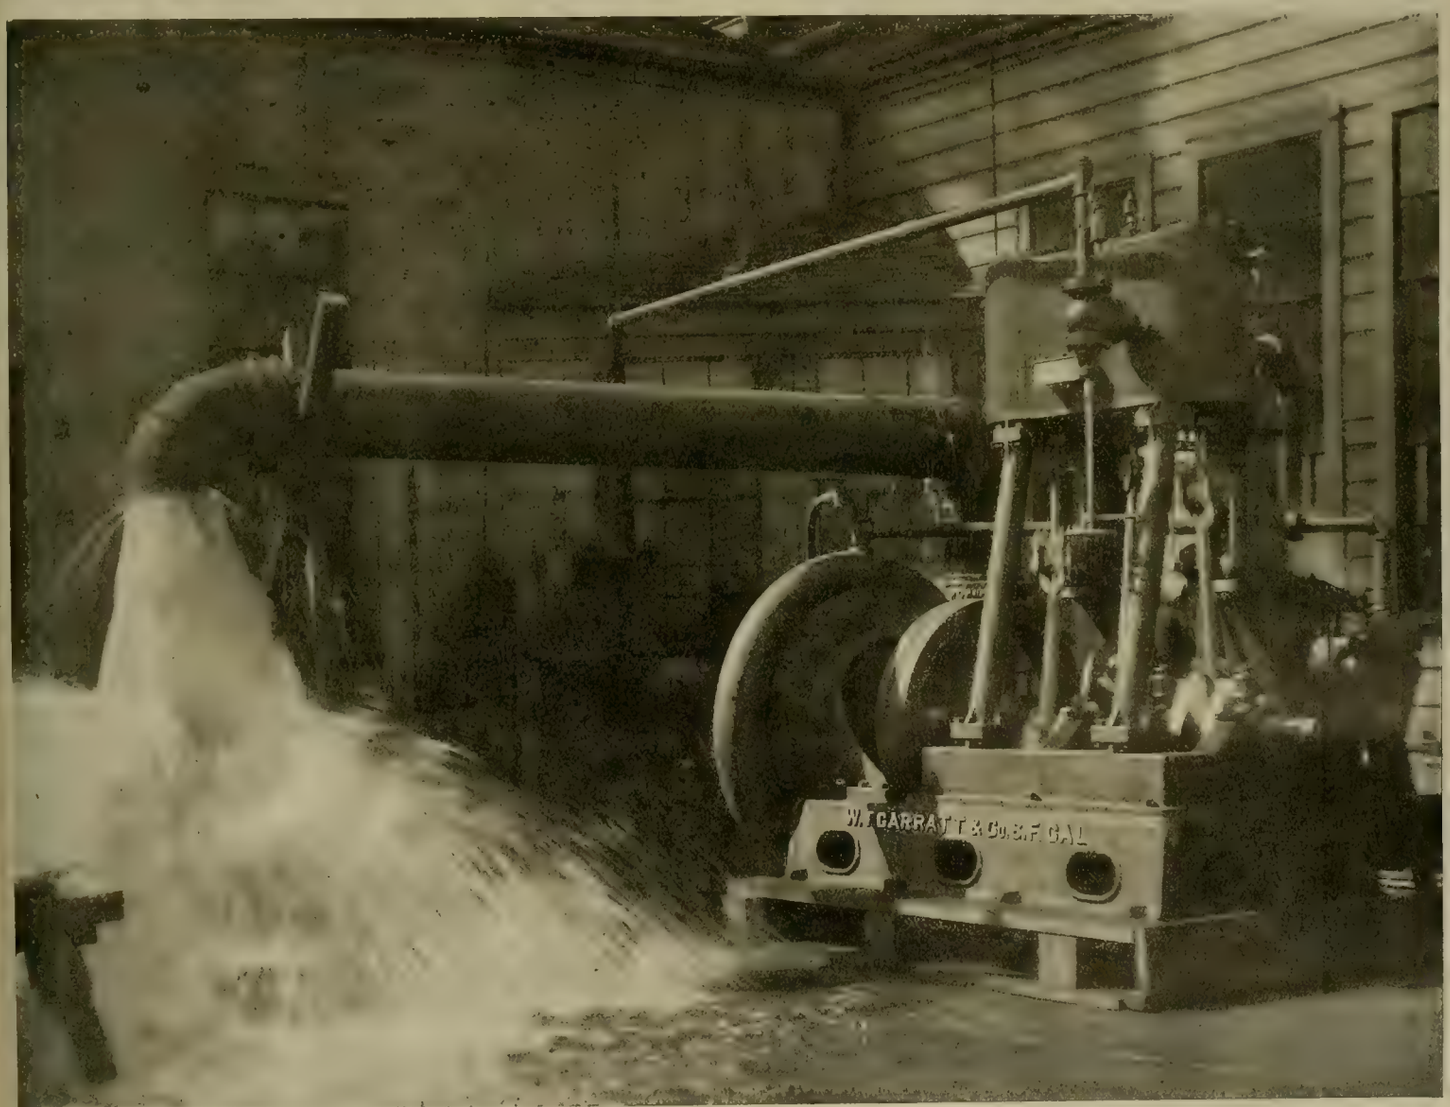
Irrigating Pumping Plant.

The accompanying engraving illustrates one of six irrigating pumping plants recently built by W. T. Garratt & Co., at their Fifth and Brannan streets works, San Francisco. The photograph from which the engraving was made was taken while the machinery was in action during a capacity test just before shipment. Two of the plants have a working capacity of 10,000,000 gallons per day each, against a head of 40 feet; two a capacity of 3,000,000 gallons per day each, and two a capacity of 1,500,000 gallons per day each, against a head of 50 feet. The plants are to be used in irrigating large areas of already improved and cultivated lands. The engines are the vertical cross-compound condensing type, and, together with an independent air pump and condenser, are mounted on cast iron bed plate of box-girder form. The pumps are the Richards centrifugal single suction, with balanced runners, mounted on same base and with direct connection to pump.

Tests made at the works under pressures equivalent to heads of 40 and 50 feet developed high efficiencies for the combined apparatus. It was generally believed at one time that centrifugal pumps could do satisfactory work only under exceedingly low heads; but experience has shown that they are well suited to handling water economically up to 100 feet, especially where large volumes are to be moved. It is interesting to note how generally these pumps have of late years been coming into use, particularly in the irrigated districts of California, wherever the necessity of artificial irrigation has been made so urgent by inadequate rainfalls.

Such pumps are simple in their mechanism, are without complicated valve gearing or sliding contact between metal surfaces—features which adapt them to rough usage and the handling of all kinds of liquids, however impure from sand, mud or other foreign substances. The pump illustrated has its bearings entirely protected from any cutting or grinding substances the water may contain. The packing is inside the main bearings, and there is no contact with the water passing through the pump.



CENTRIFUGAL SINGLE SUCTION PUMP FOR IRRIGATION.

South Dakota has a new mining law which becomes operative July 1st, '99. It embodies some good features not common in other States. It has provided for increasing the width of quartz locations from 300 to 600 feet and requires that the owner post in a conspicuous place on the mining claim notice of any mortgage or other incumbrance before employing men on the property. He must also post a duplicate of his location certificate, signed by the register of deeds of the county in which the claim is located, within ninety days after filing the certificate. The minimum penalty for non-compliance with these requirements is $100 fine, and the maximum penalty $1000 fine, or imprisonment, or both. Legislation of this character is calculated to decrease mining litigation, for wholesale location of the same ground by several different parties is almost impossible. It conceives that a miner locates a claim believing in its value, and the law protects him, but also requires him to show evidence of his faith and honest intention to actually hold and develop the property.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Centrifugal Single Suction Pump for Irrigation, 397. Arrangement of Flanges in Pipe Line on Curves; Hoist at Magalia Mine, Butte Co., Cal.; Cement Gravel Stamp Mill, Magalia Mine, Butte Co., Cal., 400. Plan of Tables in Magalia Mill, 401. Largest Black Chimney, 402. Latest Mining and Metallurgical Patents, 402-403. General View of Cammett Concentrator; Head Motion of Concentrator; End View of Concentrator; The Rocker and Base; One Side of Interior of Rocker, 409.

EDITORIAL.—Irrigating Pumping Plant; South Dakota's New Mining Law, 397. The Newest Thing in Street-Car Traffic; Chemically Pure Water; Trusts Multiplying in Number; Rush for Copper Mines; Exhibits at the Paris Exposition; To Reduce the Price of Gas; Effects of the War with Spain; Construction of a Rocker; Death of ex-Justice Field; Mining Law in California and South Dakota; Answering Some Questions, 398.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 405-6-7.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 422.

MISCELLANEOUS.—Concentrates, 399. The Magalia, Cal., Drift Mine, 400. The Genesis of Petroleum and Asphaltum in California, 401. Largest Black Chimney, 402. Latest Mining and Metallurgical Patents, 402-403. Machines for Lifting Mine Cars; Device to Prevent Collisions on Railroads; Indian Maize; Copper Ore, Etc., 403. Development of Submarine Telegraphy; The Cost of a Train Mile; Correct Mining Blanks a Necessity; The Eight-Hour Law in Rossland, B. C., 404. Industrial Notes; Personal; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Catalogues, 408. The Cammett Concentrator; How to Build a Rocker, 409. Books Received; Recently Declared Mining Dividends; California Mining Incorporations, 422.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

THE newest thing in street-car traffic is an electric push button on the latest make of street cars. To those who have found difficulty in catching the conductor's eye when desirous of alighting, the new signal will be a convenience.

A SCIENTIST of some standing asserts that chemically pure water is poison to the human stomach, upsetting some hitherto accepted theories regarding distilled water by the argument that in distillation the water loses sundry salts that it greedily abstracts from the animal tissues when it is swallowed, thus constituting a protoplasmic poison. If this view be sustained, "absolutely pure water" is more dangerous than ordinary water impregnated with impurities absorbed from the atmosphere or collected in its flow.

THE trusts continue to multiply in number, variety and extent. "Economy of production" has ceased to be the shibboleth. The watchword of most of those artificial trade combinations now seems to be suppression of competition and supreme control of the industrial field. These matters have been commented upon in these columns, and it is noticed that universally leading conservative publications in similar comment arrive at similar conclusions. All that is going on now has occurred before, and the immutable laws of business must insure a repetition of results.

IN the great rush for copper mines and prospects in which promotors and capitalists are now indulging, gold properties are either brushed aside or lost sight of entirely. They seem to fail to realize that the copper market is a most uncertain quantity. The price of copper is higher now than it has been since '78, and there is no positive assurance that the present high prices will be maintained. Gold, however, is quoted to-day at the same price it was twenty years ago, and it is not unsafe to predict that the price of gold will be maintained through the copper boom and for a long time after it has subsided and been forgotten. The tremendous inflation in the value of copper stocks and the fancy prices being paid for copper mines and prospects will surely result in disaster, and the reactionary effect will not be to the advantage of the mining industry, for mining, as an industry, will be blamed for the collapse. The investor will not stop to consider his own folly, but will emphatically express his opinion of mining generally and it may be surmised that his remarks will not be wholly complimentary.

ON the opposite page appears an official request from the Commissioner General and the Director of Exploitation of the U. S. Commission to the Paris Exposition of 1900 that needs immediate observance on the part of all in this west half of America who in any way contemplate a business exhibit at next year's Paris exhibition. The urgency of time and the necessity for prompt action by public and private exhibitors have already received editorial comment, and the official request on page 399 serves to emphasize this important matter.

GAS ENGINE makers and users are interested in the present effort in San Francisco to reduce the price of gas from $1.75 per 1000 cubic feet to $1.10. Cheaper gas would have considerable influence in power distribution. In Boston coal gas of 18 candle power, containing less than 10% carbonic oxide, is proffered for 75 cents per 1000 cubic feet for use in gas engines. It is figured that the tariff would make the price to be $1\frac{1}{2}$ cents in engines up to 100 H. P., $1\frac{1}{10}$ cents in engines from 100 to 200 H. P.; and 1 cent per H. P. hour in engines of more than 200 H. P.

THE recent war with Spain has had many effects, beneficial and otherwise. Among the many far-reaching results of the former class is the removal by Congress of the old line and staff distinction in the navy, and the recognition of the engineer. It is a triumph of skill, intelligence and merit over the old hide-bound quarterdeck dictum that the engineers were inferior to line officers. It is official recognition of the fact that the modern warship is a big engineering workshop, and that the men who know how to build and run the works are of equal importance with all others, afloat or ashore.

IT may seem strange that the MINING AND SCIENTIFIC PRESS should at this late day publish a description of the construction of a rocker. The article on this subject which appears elsewhere in this issue was prepared at the request of a subscriber. In looking over the files of the paper no cuts of the details of construction of this useful mechanism of the placer miner were found, and the drawings accompanying the text were made particularly to illustrate the article. While it is one of the earliest devices employed for saving gold in California, it still has its field of usefulness.

THE death of S. J. Field, ex-Justice of the U. S. Supreme Court, deserves a word of respectful remembrance and appreciation. He was a man of great aid and value to the miners of California and other States. To him more than any other one man is due even the little recognition in Federal law that is given the American miner, who gives more and gets less than any other class. It was Judge Field who first put in force the idea that the men who know what they want and how to get it should have voice in the preparation of laws governing their property rights, and, for the first time in human history, the laws enacted by the California miners for local rules and regulations were made the base of the statutes on that subject and so interpreted by the highest tribunal on earth, of which Judge Field was a member longer than any other man.

THE action of the California Legislature in regard to the mining law is in decided contrast to that taken in South Dakota. In the former case all local requirements, good or bad, are swept aside, and the proposition reverts to the unsatisfactory Federal statutes. It reopens the way for the multi-location fiend, and, requiring no work for nearly two years, practically brings legitimate prospecting to a standstill. The Dakota law enforces upon the prospector what would be considered in California great and unnecessary hardship, but it protects the prospector who is honest in his intention and shuts out that class who rush in and stake or monument scores of claims and then sit down waiting for some one to buy them out—begging a premium for laziness. But few prospectors can afford to develop more than three or four claims. Why the legal requirements—Federal or local—prescribing the manner of locating a mining claim should be less plain or be less exacting than the laws defining the manner of appropriating the agricultural lands of the public domain is hard to understand. That the Federal mining laws are unsatisfactory no one will deny, but why would-be mine locators complain of the hardship and injustice of the requirements of a law, which if faithfully followed out will protect him in his holdings, is even more difficult of comprehension. No such plaintive cry is heard from the farmer who locates agricultural land. It is true, he is denied the right to wholesale appropriation of such lands, but he knows that if his filings and subsequent procedure are within the requirements of the law he will be able to secure a patent without difficulty and his title is perfect. Few mining claims have any considerable intrinsic value when located, but many of them develop into very valuable property, and then is the time, if any defect exist in location, record, or other matter affecting the title, that trouble and litigation follow. Such being the case, why should not the miner not only secure himself by complying with the exact letter of the law, but demand a law which will insure to himself or his assigns the same security in his possession as the agriculturist finds?

Answering Some Questions.

A dyke is a vein-like mass of eruptive rock intruded from great depth and cutting older rocks, whether sedimentary, metamorphic or massive. They may conform with such older rocks in strike and dip or may cut across them. A granite dyke may intrude an older granite formation. A true fissure vein is a vein which has formed in a fracture of the earth's crust which extends to unknown but certainly to great depth. All fissure veins are true veins. The term "false fissure vein" indicates nothing. A gash vein is the result of the erosion of a lens of quartz or other mineral, the lower portion only remaining. They occur most commonly in mica schists and rocks of similar character. Most fissures are formed as the result of a tremendous compressive stress in the rocks, thought by some to be due to the cooling of the interior of the earth and a consequent attempt of the outer crust to readjust itself to the new condition. Under this stress rocks along certain lines are often wrinkled, as it were, the incipient stage of folding which results later if the stress continues. Should the strain continue after folding has taken place, a point is eventually reached when the rigid rock masses are no longer able to withstand the strain and a fracture results. Displacement nearly always follows, but the amount of movement is sometimes scarcely noticeable. In other cases it reaches many thousands of feet. These movements are seldom violent but continue over a long period of time. Mineral solutions ascend along the planes thus made and a fissure vein is formed. This is the true fissure vein. A plane of weakness having been established, dykes are also often thrust in along the same plane or near it. In some instances the dyke has been intruded first, the vein forming subsequently. In the early stages of the formation of the vein the strata are bent and twisted and many open spaces and zones of crushing are formed. Should the stress upon the rocks find relief elsewhere or cease entirely no fissure would result, though mineral solutions might pass upward along this zone of compression and folding and many lenses of ore might result. As these lenses usually succeed each other in a given direction, often overlapping, they practically constitute a vein, and in some instances may be called a true vein. When the torsion of the rocks has resulted in the formation of lenses of quartz or ore at considerable distances from each other, and the upper portion of one of these deposits is removed by erosion, the remaining lower portion constitutes the gash vein described above. A contact vein is an ore deposit lying between two unlike formations as limestone and quartzite. Some years ago a contact was looked upon with great favor but as the genesis of ore deposits is becoming better understood those prejudices in favor of particular forms of deposit and certain kinds of wall rocks are disappearing.

Concentrates.

AN inch of rain on an area one mile square would amount to 17,424,000 gallons.

THE register of any U. S. Land Office cannot act as attorney for an application for patent.

THE laws of Utah do not permit of the existence of two corporations of the same name in that State.

OF the 750,000 miles of telephone wire in operation in the United States, about one-half is underground.

U. S. TARIFF collectors hold that imported ferrochrome is unwrought metal and must pay a duty of 20% ad valorem.

GAS engines work all right at high altitudes. One is in daily use at a mine near Georgetown, Colo., over 10,000 feet above the sea.

A GOOD hydraulic giant, 14 feet long, will weigh from 1000 to 1300 pounds and should throw 500 inches water under a 265-foot pressure.

TO FREEZE a quicksand for the purpose of sinking a shaft an uncongealable liquid is employed, a saturated solution of water and calcium chloride.

THE Simmer & Jack is the present leading gold producer in South Africa. During '98, at the Robinson, the daily duty per stamp was 4.35 tons.

ON the 13th inst., the Standard Oil people took control of the Parrot, Montana, copper property, they now owning 168,000 of the 230,000 shares.

THE specific gravity of protoxide of antimony is 5.778; a cubic foot weighs 361 pounds. The figures for platinum, rolled, are 22.06 and 1379, respectively.

ONE POUND troy weight equals 22.7944 cubic inches distilled water, barometer 30 inches; one pound avoirdupois weight equals 27.7015 cubic inches, same.

"STUCCO" is the mortar covering placed on the exterior walls to protect the material of the wall from weather effects, or to secure a smooth finish for imitating stone.

THE distinction between the obligation of a surety and a grantor is that the surety undertakes to pay if the principal does not, while the grantor agrees to pay if the principal can not.

PROBABLY the best conductor of electricity is annealed silver. As between two conductors the poorer can be made of equal efficiency with the better by being of larger mass or diameter.

A NEW mineral found in Algeria analyzes osmium-iridium, 4.85%; titaniferous iron, 2.15%; copper, 1.78%; palladium, 0.89%; platinum, 9.64%. This mineral is said to be found in nuggets in clay.

IT is by the prevention of crystallization that the addition of a small percentage of manganese to steel adds to its value in welding. Manganese increases the tensile strength of iron, and diminishes its fusibility and ductility.

THE best thing for a "working miner" to do regarding Yukon and Alaska mining companies, "limited," or "unlimited" is to let them alone. They are all right as far as they go, but they don't go very far in "a working miner's" direction.

THE Ute Indian reservation is 15 by 60 miles, south and east of Durango, Colorado. It will be opened to white settlement and occupation at noon May 4th, '99. The land office is in Durango. The Denver and Rio Grande railroad is the only line reaching the reservation.

AVERAGING a lot of assays is not generally of satisfactory result. Mill returns are often disappointingly lower than the "average." Such assays show the fact of presence of gold, but not what mill returns may be confidently looked for from treatment of large quantities of ore.

THE prophecies, predictions and claims of what he is "going" to do, by Nikola Tesla, the New York electrician, are interesting—to readers of "science progress" in Sunday newspapers, but have considerable Keeley flavor. Like the San Francisco Stock Exchange, Mr. T. seems to lack a leader.

THE simultaneous operation of a telephone and telegraph circuit over one wire is to be considered feasible. Such experiments have been made, the latest noticed being over the D. L. & W. R. R. Co., between their New York office and points in New Jersey, and are reported to have been successful.

A PATTERN made of yellow pine, and weighing one pound, will weigh when cast in iron 13⅓ pounds; zinc, 12½; copper, 16; yellow brass, 15½; gun metal, 16. A pattern for cast iron should be made ⅛-inch longer per lineal foot; brass, 16-inch; lead, ⅛ to 3-16-inch; tin, 1-12-inch; zinc, 3-16 to ¼-inch.

DURING the week the Canadian Government passed an order preventing any person employed by that Government from staking out or recording mining claims on dominion land in the Yukon territory. It was also decided to exempt from the realty tax the gross output of any mine up to the amount of $5000.

A CRACK in a piece of metal is best prevented from extending farther by drilling a hole where the crack ends: if not drilled at just that exact spot the crack is likely to continue on beyond the hole. How to find the exact spot is aided by instructions in this column in the issue of March 25th, '99.

THE terms and conditions of a mining lease should be in exact detail, and so worded as to be capable of thorough understanding. Of course, it should be in writing, duly attested and recorded. There is no authority of law under which public lands may be leased by the Government for mining purposes.

THE California mineral land bill is not dead but sleepeth. It is always just going to pass Congress, and some day may surprise its friends and enemies by getting through—about the time that the conditions that called it into necessary being have passed away by reason of most of the mineral area having been absorbed by corporate craft.

IN '98 the Boston & Montana Copper Co.'s gross receipts were $7,448,600; the total expenses were $4,058,957; sixteen dividends were paid, aggregating $2,400,000. The electrolytic plant has a monthly capacity of 4,000,000 pounds. It is understood that the company would enter the Standard Oil combine at $450 per share, which on the company's '98 earnings would be equivalent to a 5% investment.

THE apparent reason for the existing difference in price between copper produced in the Lake Superior district and electrolytic copper from Montana, Arizona and elsewhere is not due to any special superiority. Most, if not all, the former product is sold ahead, and is more the subject of street speculation. It is not a matter of quality, but the invariable speculative tendency that causes the difference in price.

COMMISSIONER GENERAL, FERDINAND W. PECK,
ASSISTANT COMMISSIONER GENERAL, BENJAMIN D. WOODWARD.
SECRETARY OF THE COMMISSION, FREDERICK BRACKETT.

UNITED STATES COMMISSION
TO THE
PARIS EXPOSITION OF 1900.

CHICAGO, AUDITORIUM BUILDING. NEW YORK, EQUITABLE BUILDING. PARIS, 20 AVENUE RAPP.

CHICAGO OFFICES, April 4th, 1899.

To the Mining and Scientific Press:

Will you please state that all who desire to exhibit in the Paris Exposition of 1900 are requested to immediately notify this office, if they have not already done so, in order that they may be considered in the allotment of space which will soon be made. While there are many applications on file in every line of industry, it is desirable that the American Sections be not only representative of this country but also represent the largest possible number of producers. Both our commercial interests and national pride demand that our works be entered in this most important International Exposition. It is estimated that fully 60,000,000 people from every part of the globe will attend, and it will be an opportunity to greatly increase our foreign trade and to demonstrate that the United States is supreme in the arts of peace.

* * * * * * *

Respectfully,

Approved: JOHN H. McGIBBONS,
FERDINAND W. PECK, Director of Exploitation.
Commissioner-General.

IT is one of the proudest prerogatives of an American citizen to continuously spell his name in any way that suits his sovereign fancy, being responsible, as in all other things, for an abuse of the privilege. Nor is there any law to prevent an individual from relocating his own mining claim under a different name, though, naturally, such actions justify suspicion. There are many things on which the statutes are silent.

THE recent law regarding assaying passed by the Arizona Legislature enacts that the Territorial University shall do an assaying business, charging from $1 to $2.50 for each assay. The bill is No. 68, and is entitled "An Act to Encourage Prospectors." From the prospectors' point of view it is all right, but it is tough on the Arizona assayers to have the Territory where they pay taxes come into business competition with them.

THE cost of producing copper is differently stated by different authorities. It is understood that at Butte, Montana, the average cost is about 7 cents per pound; at Houghton, Mich., 6 cents. Franklin Farrell who takes charge May 1st of the United Verde Extension G. S. & C. Co., Jerome, Arizona, is credited in Boston with having "placed himself on record" as saying that that company "will produce copper at a cost of not over 3 cents per pound."

LACK of transportation facilities form an almost insuperable bar to mining operations in some localities. In Plumas county, Cal., at the De Long mine on the north fork of Feather river, where a large river mining scheme is now under way, the machinery is carried from the railroad terminus by wagon, thence over steep trails to a point opposite and above its destination and then lowered down the mountain side to the river many hundred feet below.

TO TEMPER and magnetize steel rods should (if desired to be straight) be made so while soft, then heated red by daylight, plunged into water vertically, cleaned so that the tempering color can be easily seen, and the temper drawn on an iron plate to a deep orange color, and then cooled in water. To magnetize lay the ends of the rods alternately on the north and south poles of a permanent or electro-magnet. The magnet of a dynamo or motor may thus be utilized.

TO RENDER textile fabrics uninflammable phosphate of ammonia is recommended. The solution should be weak—from 20% to 30%. Garments, etc., dipped in this solution, when dry will be found so fire protected that no amount of contact with fire will set the substances in a blaze. The surface may present a charred aspect, but there will be no flame and the combustion will not spread. In the case of washable material the solution should, of course, be applied after each washing.

ONE recommended way to smelt electrically consists in using black lead or plumbago crucibles, which, being conductive to the electric current, and of high resistance, may (according to recent electrical authority) "be made the means of producing the heat within themselves." It is simply necessary to stand the pot on a heavy copper plate connected to one pole of a dynamo, another copper plate acting as a cover for the pot, which should fit neatly, and to which the other pole of the dynamo is attached.

AT the works of the Mannesman Tube Co., Germany, is in use a wire flywheel, made up of a cast-iron hub to which are attached two steel plate disks or cheeks 20 feet in diameter. The peripheral space between the two disks is filled in with seventy tons No. 5 steel wire, wound around the hub. It is said that the tensile resistance thus obtained is superior to that of any casting. This flywheel turns at a speed of 240 revolutions per minute—a peripheral velocity of 2.8 miles per minute. The length of wire on such a constructed flywheel is estimated to be about 250 miles.

IN the manufacture of a dynamo good results are had from making the armature with slots parallel to the shaft in which the current-carrying wires are placed, for, by reducing the distance that the magnetization has to be forced through copper and air, it reduces the number of turns of wire necessary to the field, hence the weight. It also protects the wire from mechanical injury, and affords a positive action in the driving around of the armature core by the conductors, for it is on them the turning force is exerted. Mica is best used for insulating from each other the segments of the commutator.

IN using oil fuel for boilers the approved way of starting the sprayer or atomizer is to light a handful of oil-saturated waste, and put it in the furnace in front of the sprinkler. The steam valve of the sprinkler should be the first opened, and the oil valve opened last. The reverse of this rule is to be observed in stopping the atomizer. When oil gets into the furnace without prompt ignition its vapor creates an explosive gas that is ready to do damage on short notice. Familiarity should never lapse into carelessness, and unless atomizers are carefully attended to, the attendant is liable to sudden and serious injury.

KAOLIN, or China clay, is not uncommon in this country. It is found in several localities in this west half of America. One notable deposit is between Silver Cliff and Rosita, Colo. Most clay results from the decomposition of feldspars in granitic or volcanic rocks. Iron manifests its presence by imparting a red, yellow or drab tint; with pure or white feldspar, and no iron, the clay is of a milky whiteness and is kaolin. Chinese "chinaware" was made from decomposed felspathic porphyry dykes. The Colorado clay mentioned was made by the decomposition by solfataric and other aqueous action of the flows of volcanic rhyolite.

SUPT. COOK of the United Globe mines, Globe, Arizona, has what seems to be an effective arrangement for saving the flue dust which might be of use to our British Columbia inquirer. At the United Globe there are two furnaces in blast, one 88x96 feet, the other 42x120. The flue dust saver is a cylinder 8 feet inside diameter, 72 feet long, laid horizontally on the roof of the smelter, just behind the stacks, and connected with them by 3-foot pipes. The tops of the stacks being closed the smoke is forced into the cylinder, the collected dust being carried to one end of the chamber where it falls into a press on the feed floor and is there compressed into bricquettes.

SECTION 1159 of the California Civil Code provides that all notices relating to mining claims "may" be filed with the county recorder. This section is in force, but it is not obligatory. As heretofore explained, the last California Legislature repealed the law passed by its predecessor in '97 concerning mining locations, and everything is now just as it was before the law was passed. Nothing rules in California regarding those things but the U. S. Statutes and whatever local laws and customs are not in conflict therewith. Already in Shasta and other counties is reported revival of the old mining districts, and in some cases demands have been made on county boards of supervisors for the old district records placed with them when the law of '97 (now repealed) went into effect.

The Magalia, Cal., Drift Mine.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. D. GASSAWAY, E. M.

Column Pipe.—The column pipe extending from the large pump to the 245 foot level is made of 9-inch lap-welded tubing, exterior diameter 9.68 inches, in sections exactly 15 feet in length, so as to be interchangeable. The heavy flanges are truly bored, so as to make a shrinkage-fit for each length of pipe. After being shrunk onto the pipe in proper position, they are beaded over and faced off to make proper joints. The flanges are male and female and are turned true for rubber gaskets. From the 245 foot station to the surface the column is made of 10-inch casing, inside diameter about 9.63-inch, with plain flanges bored, shrunk and beaded on, as in the heavy pipe below.

For awhile all the water was pumped to the surface; but, as the mouth of the old incline is 217 feet lower than the collar of the shaft, about 700 feet of 7-inch and nearly 1800 feet of 8-inch casing was laid from the bottom of the shaft through the old works to that point, and the pumps now discharge into Little Butte creek. This line of tubing connects with the large column pipe at the bottom of the shaft by a Y. The pumps discharge into the column pipe, where the water rises to a height sufficient to force it through the 7-inch and 8-inch tubing. A gate is placed between the Y and the 7-inch pipe, which may be closed and the water pumped to the top of the shaft, as at first, when necessary.

Some of the turns in the old works were very sharp, which made it difficult to lay the tubing. Wherever the ground would permit the pipe was screwed together, but on the curves the pipe was heated and bent, or cast-iron angle pieces and flanges were used. Beveled flange unions, all of the same angle, were used on the 8-inch pipe, and almost any angle up to 20° could be turned, the amount depending on the position of the flanges, as shown in the sketch.

FIG. 4.—ARRANGEMENT OF FLANGES IN PIPE LINE ON CURVES.

Boilers.—There are three boilers stationed near the hoist at the top of the shaft, size 54 inches by 16 feet, 60 inches by 14 feet and 48 inches by 16 feet, respectively, besides a small upright boiler that is seldom used. In the event of a failure in the water supply, through breakage of the ditch or in case of repairs on the compressor, these boilers furnish power for pumping. They are also used for reheating and underground hoisting.

Steam is conducted from the boilers to the large pump station at the bottom of the shaft by 600 feet of 3½-inch pipe, inside diameter, and thence to No. 3 pump station, 1950 feet distant, in 150 feet of 2½-inch gas pipe and about 1800 feet of 3-inch casing. All of this pipe is first wrapped with asbestos, then with hair felt. From the boilers down the shaft to the large pump station the whole is thoroughly wrapped with canvas; thence to No. 3 station it is enclosed in a wooden box to protect the felt and asbestos from the action of the water. This covering, being an excellent non-conductor, keeps the pipe hot and prevents the rapid condensation so common in long lines of bare steam pipe.

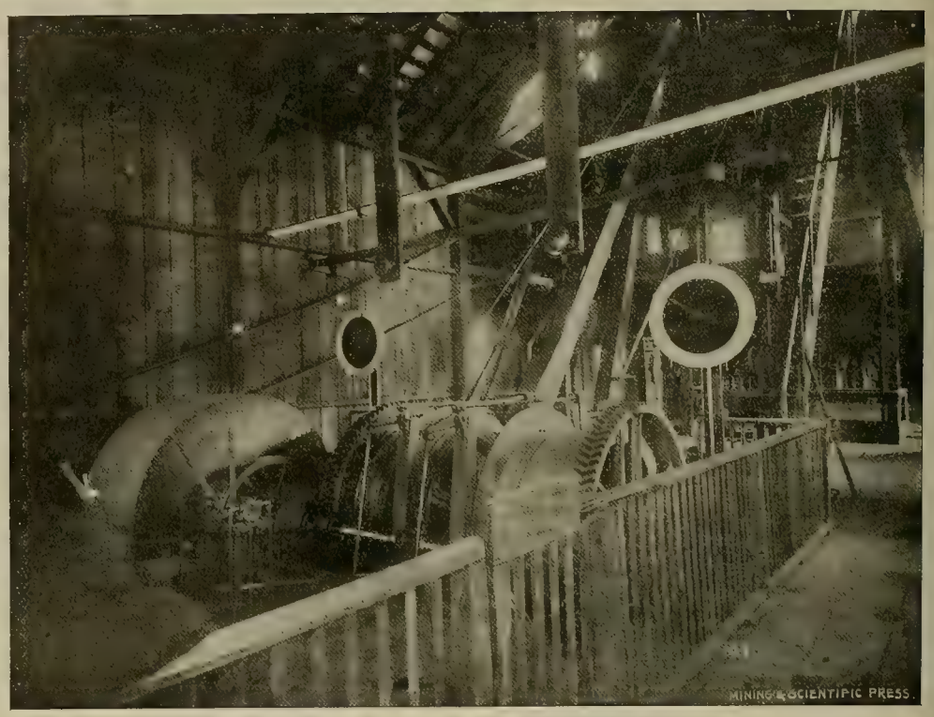
Expansion joints are placed at suitable distances to counteract the injurious effects of expansion and contraction, which otherwise would soon tear the pipe from its fastenings and cause it to leak. The loss of pressure by friction and condensation from the boilers to No. 3 station, 2600 feet distant, is about fifteen pounds.

Power.—The motive power is obtained from the Cherokee ditch and is delivered from the pressure box to the wheel through 1854 feet of 30-inch and 1850 feet of 26-inch pipe. The average length of the 30-inch sections is 19.73 feet and the iron .073. The average length of the 26-inch sections is 19.27 feet and the gauge .07 inch. It is double riveted longitudinally and single riveted transversely. Air valves are set at proper distances and the pipe is placed in the ground and carefully covered to prevent unequal expansion and contraction. The total weight of the pipe is 95,000 pounds.

A receiver 36 inches in diameter and 11 feet 6 inches in length is placed near the compressor, and another about half as large is located at the No. 2 pump station, about 2400 feet from it. The air is carried from the large receiver down the shaft to the large pump station through 650 feet of 6-inch casing pipe; thence 1675 feet in 4-inch casing and from thence on to No. 3 pump station, and to the face in 3½-inch casing. Wherever the pipe can be put in straight it is screwed together, but on the curves, where it is necessary to bend it and the joints cannot be screwed together, flange unions are used with rubber gaskets. The loss of pressure between the compressor and No. 3 pump station is about 2½ pounds, while at the station at the bottom of the shaft there is a gain of 1½ pounds.

Reheaters.—At the pump stations the air is passed through steam reheaters before it is admitted to the pumps. These reheaters consist of one or two coils or "worms" of ¾-inch pipe within a wrought-iron drum with cast iron heads. The heads are screwed on to the tubing that forms the drum, and the whole is about 12 inches in diameter and 2 feet 4 inches in length. The steam enters the coils at the top and passes out at the bottom into a steam trap. The air occupies the entire space within the drums and around the coils. If the reheater has double coils, one is placed within the other. As the steam circulates withinthe coils its heat is imparted to the air by conduction, thus raising it to a higher temperature, the expansion rendering it more efficient.

At the large pump station two of these reheaters are used. The air enters the top of one, passes from the bottom of the same into the bottom of the other, and thence out through the top into the pump. In running compound pumps by compressed air it is necessary to reheat it, otherwise they will freeze up, unless they are quite close to the compressor, or the air has retained its heat. Simple pumps may be run under ordinary conditions without reheating, but even then it pays to reheat.

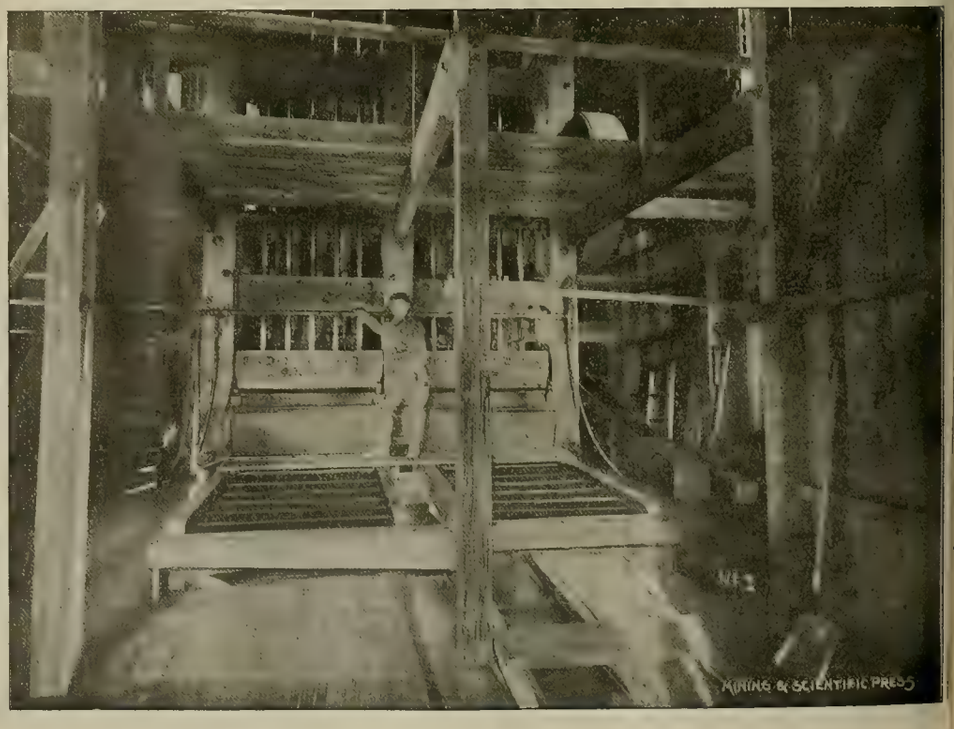


HOIST AT MAGALIA MINE, BUTTE COUNTY, CAL.

Hoist.—The double drum hoist was built by the Union Iron Works of San Francisco. The 6-foot Pelton wheels operate under an effective head of 140 feet. The hoist is geared so that 150 revolutions per minute of the water wheels run the drums at 30, which gives the cage a speed of 400 feet per minute. By using two water wheels the drums are allowed to run either way. The pinions are loose on the wheel shaft and are operated by clutches. The drums may be operated singly or together. Heavy post brakes are used. The gates that turn the water off and onto the wheels are operated by a hydraulic stand made by the Pelton Water Wheel Co. The power is derived from a 12-inch pipe connecting with the 26-inch main that supplies the compressor.

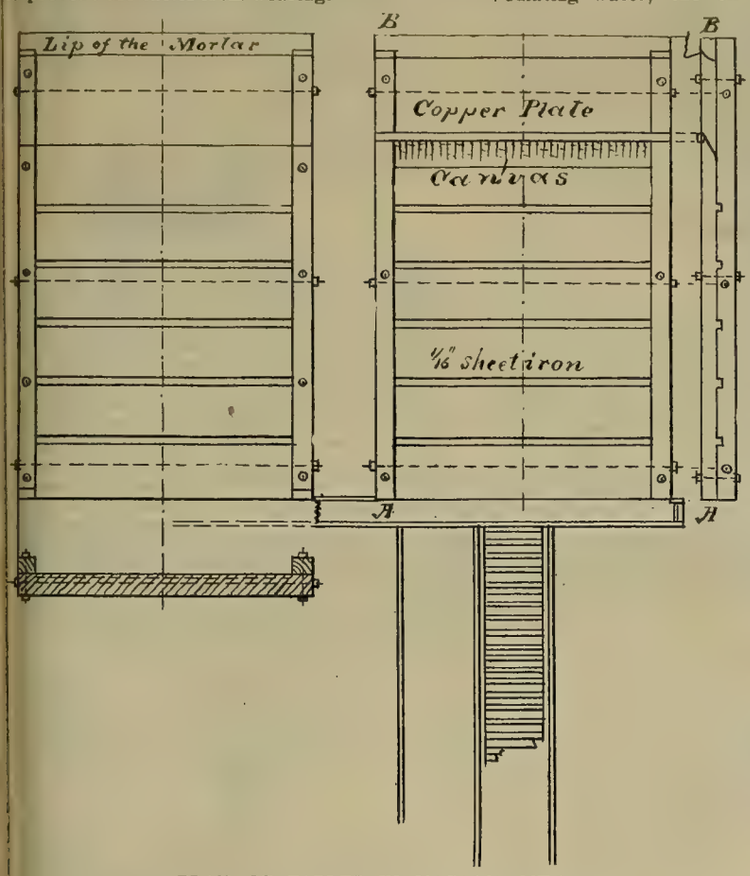
Ventilation.—As the collar of the shaft is 227 feet higher than the mouth of the old works in Little Butte creek, the shaft acts as the "upcast." The old works are bulkheaded at the bottom of the shaft and from there 700 feet of 15-inch, and about 3100 feet of 10-inch air pipe carries a constant current of cool fresh air to the face. This current returns through the gangway to the shaft and thence to the surface laden with the powder smoke and foul gases of the mine. This current is strengthened by a No. 2 blower driven by a No. 1 Pelton motor on the same shaft and base. This blower is placed at the upper end of the air pipe just within the old works and is operated by a small stream from the pump column under a 300-foot head.

Milling.—The gravel was formerly free and easily



CEMENT GRAVEL STAMP MILL, MAGALIA MINE, BUTTE COUNTY, CAL.

washed, but finally it was found so heavily cemented that it became necessary to erect a mill to liberate the gold from the matrix. A 10-stamp mill, driven by water power was completed in October, '97. The stamps weigh 850 pounds and drop 7 inches 102 times per minute. Chrome steel shoes and dies are used. Woven steel wire screens with a $\frac{3}{16}$-inch mesh are used. The duty of a stamp is about eight tons in twenty-four hours, the amount varying with the hardness of the material. The gravel is dumped onto inclined grizzlies, when the coarse lumps and cobbles slide onto heavy horizontal grizzlies. Here the lumps are reduced to the proper size and the cobbles thrown to one side where they are finally washed and removed to the waste dump. The mortars discharge onto tables 53 inches wide in the clear and 8 feet long, made of sugar pine plank 4 inches thick, and have a grade of $\frac{3}{4}$-inch to the foot. The upper portion of the tables is covered with copper plates 30 inches wide. The remaining space contains grooves 2 inches wide and $\frac{1}{2}$-inch deep running crosswise, 10 inches apart, and filled with quicksilver. The space between the grooves is lined with sheet iron $\frac{1}{16}$-inch thick to prevent the tables from wearing.



PLAN OF TABLES IN MAGALIA MILL.
Grade ¾ inch to 1 foot. Grooves ½ inch deep, 2 inches wide.

As the gold is coarse most of it remains in the mortars, while nearly all that passes the screens is caught on the tables.

After the pulp leaves the tables it passes through a double sluice, each part 15 inches wide in the clear and lined with Hungarian riffles. Very little amalgam reaches this sluice, which discharges into a 16-inch sluice 1500 feet in length, lined with riffles made of 2-inch stuff lined with strap iron and 2x4-inch and 3x4-inch scantling. This sluice was used for washing before the construction of the mill. A small sluice with 10-inch sides and 13-inch riffles carries the material about 4300 feet farther, beyond the point where the Cherokee ditch again takes the water from the ravine. It was necessary to construct the sluice to this point to prevent the mud and slimes from entering the ditch.

Plates do not work successfully as, on account of the large amount of coarse material that passes over, it is very difficult to keep them from scouring.

A strip of canvas or burlap about 10 inches wide and 53 inches long, the width of the tables, tacked to a 1x2-inch strip, rests on the sides or ribs of the tables just above the upper groove, to prevent the "splash" from whipping the quicksilver from the grooves.

The loss of quicksilver in milling 27,000 tons of gravel was .07 ounce to the ton. The cost for shoes and dies in milling 20,000 tons was about 1 cent per ton.

It pays to mill gravel, especially if it is clayey or even slightly cemented. The large amount of gold taken from tailing claims, after passing from hydraulic and drift mines through long lines of sluices and undercurrents, is ample evidence that it does. Milling does not save it all, but it will save such a large percentage that reworking the tailings will hardly prove profitable in most instances. The cost of milling should not exceed 15 cents per ton, and under ordinary conditions should be reduced to about 11 cents. This is exclusive of the first cost of the plant. Experience in the West Harmony mill, containing fifteen stamps, at Nevada City, and in the Mayflower mill of twenty stamps at Forest Hill, and in the Magalia mill, substantiates the above. It is difficult to wash the gravel from the average drift mine without losing several times that amount.

Magalia, Cal., March 25th, '99.

The Genesis of Petroleum and Asphaltum in California.

NUMBER XI.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

The argillaceous material cannot be removed like the calcareous and silicious cementing matter, consequently sands cemented with argillaceous material seldom contain bituminous accumulations to any great extent. When the calcareous and silicious cementing material is removed by circulating water, the oil if present occupies the sand. This leaching generally occurs along the line of faults and the summits of anticlines, as they more readily offer avenues for the egress of water, but may occur along anticlinal dips and in synclines; in fact in any place where the intricate subterranean course of percolating water reaches the sandstone. When the circulating water has been copious the calcareous and silicious cementing material has been carried away to the surface of the earth, sometimes forming deposits of sinter, tufa, limestone or dolomite. When the flow of these waters charged with carbonate of lime and silica has been feeble, the sandstone has again been cemented and made impervious to water, then the flow of water ceases or finds some other path of escape.

Deposits of petroleum oil, resembling pools, occur in the sandstone stratum in which the circumjacent sandstone is cemented with calcareous and silicious material. The portion of the stratum now occupied by the bitumen was formerly occupied by the carbonate of lime or silica, the lime or silica having been removed by the solvent action of percolating and circulating waters. If the gas and oil are ever removed from these porous strata, they will in all probability be again cemented by lime or silica, if water again takes possession and its flow is feeble.

Shale is laminated clay, more or less indurated, splitting into thin sheets along the original laminæ of deposition. In California the majority of shales are quite soft, being easily cut with a knife.

A large proportion of the oil obtained in California is taken from the cracks and recesses in shale. The strata are arranged around the axis of the anticline in concentric circles. During distortion occasioned by the uplifting of the strata there would be an elongation of these concentric strata. If they consisted of non-elastic shale they would be cracked and seamed transversely to the seams of their bedding. This would occur to a greater extent in the strata farthest from the axis of the anticline. If there was a great weight of superincumbent earth the cracks and seams would not be so large along the planes of bedding of the shale. Being more acutely bent, the strata on the steep side of an unsymmetrical flexure would be more broken than the other side.

During its uplifting the strata on the slopes the farthest away from the axis of the anticline would move slower than those nearer the axis, consequently one strata would move upon the other, grinding the shale into plastic mud and luting seams and cracks, which would assist in forming an incasement for water and oil. This grinding movement also keeps cracks and seams from occurring parallel with and along the planes of the bedding of the shale. When the shales are bituminized in their cracks and seams one-tenth of the bitumen is in the seams that occur parallel with the planes of bedding, and nine-tenths in the cracks and seams that occur transverse to these planes. Where the shales, the cracks and seams of which are filled with bitumen, which resists the action of denudation better than the shales that do not contain it, are side by side, the latter are worn away more largely than the former and a valley results, owing to denudation acting unequally. Many bluffs and prominent peaks and ridges owe their existence and stability to the bitumen in the cracks and seams of their shales.

When water takes possession of shale the capillary attraction offers so great a resistance that oil even under enormous pressure is incapable of forcing an entrance and ejecting the water. When oil is in possession of the shale the same resistance is offered to the entrance of water. Shale saturated with water is a far better covering for petroleum than dry shale. Where the distortion of the strata has been acute the multiplicity of these cracks and seams makes the storing capacity of these fractured shales very large—in fact, many will be equal in this respect to porous sands. For reasons stated heretofore, the cracks and seams will be wider on the summits of anticlines than on their slopes or in synclines. Owing to the broken condition of the shale the petroleum has ascended from strata to strata, and not for any great distance through any particular stratum or strata, until the concretion of the bitumen by exposure to atmospheric actions, assisted by silicious waters, sealed strata from each other.

Silica and Lime.—The hot waters created by chemical heat held in solution large quantities of silica. When the hot, silicious water approached the surface of the earth it was cooled; the cooler the water became the less capable it was to hold in solution this large amount of silica. Cooling of the water eliminated the silica, which was deposited in the interstices of the shales, increasing their solidity and imperviousness. There may also be an interchange between the silica dissolved in the water and certain constituents in the sandstone and shale—for instance, carbonate of lime—the silica, having a greater degree of hardness than the substance removed, would be deposited. This silicification is a very frequent phenomenon in these rocks.

If the silicious water circulated through particular strata, the silica eliminated by the cooling of the silicious water, by its superior gravity, sank to the bottom of the strata and cemented the same. Strata adjoining the hot, silicious water may be cooler than that in which the silicious water circulates; in that case the cooler strata acts as a condenser. This action created the strata known as "shells;" the shells often occur on the top and bottom of the sands and throughout the shales. This silicification, together with the concreting of the bitumen, creates impervious strata, which is capable of holding petroleum, oil and natural gas. These silicifications, when formed in strata in which bitumen occurs, are colored black. Their color is destroyed by burning, proving that it is owing to organic material.

Silica, in a very fine condition, is frequently attracted to some organic or inorganic nucleus which has grown in successive layers or bands, often of different colors. In a similar manner the small silicious particles, separated from hot, silicious solutions, are attracted by the incasements of porous or partly porous and seamed strata.

Lime is controlled usually by the same conditions and laws as the silica. Large masses of shale and sand stones have been calcified and salicified near the bituminous deposits in California.

Deposits of bitumen and petroleum oil are controlled by the line of permanent water. Below the level of the ocean all cracks, seams, fissures and interspaces are permanently filled with water. Above the level of the ocean and below the beds of the streams the supply of water in these spaces is fairly permanent. Above the beds of the streams the supply of water is dependent upon the rainfall and the degree of freedom with which it leaves the formation.

Pervious and impervious strata modify the above conditions. Permanent water may be replaced or occupied by a deposit or column of bitumen, petroleum, oil or natural gas. When the underlying water which supports the oil is released by the uplifting of a formation above the permanent water by orogenic movements, the water leaves the formation and the oil drains into the voids formerly occupied by the water and maybe reaches the surface by the same avenues taken by the water and is lost or resinified to asphaltum. Frequently the porous strata accumulations of bitumen have resulted through the drainage of oil from a higher and large area of porous rock into a lower porous strata.

The bituminized sands on the Mesa deposit on the Sisquoc ranch show the drainage action. They are drained into a centrocline, the sides of the centrocline afterwards having been carried away by denudation; the water which buoyed up the oil escaped and the oil slowly sought the bottom of the centrocline. The sands forming the uppermost edge of the centrocline have to a great extent lost their bitumen; as soon as the bitumen leaves the sand it falls into an incoherent mass and is rapidly washed away by rains. The existing bitumen, in consequence of the long distance traveled, has become viscous principally through oxidation and evaporation.

This drainage is still slowly progressing, as in hot weather balls of nearly pure bitumen form on the

surface of the sands in the lower part of the deposit.

South of Asphalto in Kern county the bitumen has reached the bottom of the syncline by drainage and is now gradually descending through the syncline as through a ditch. Although this occurred ages ago this drainage is still in process.

(To be Continued.)

Largest Brick Chimney.

The statement was recently made in a local publication that the chimney of the Sanitary Reduction Co., in San Francisco, was the tallest in the world.

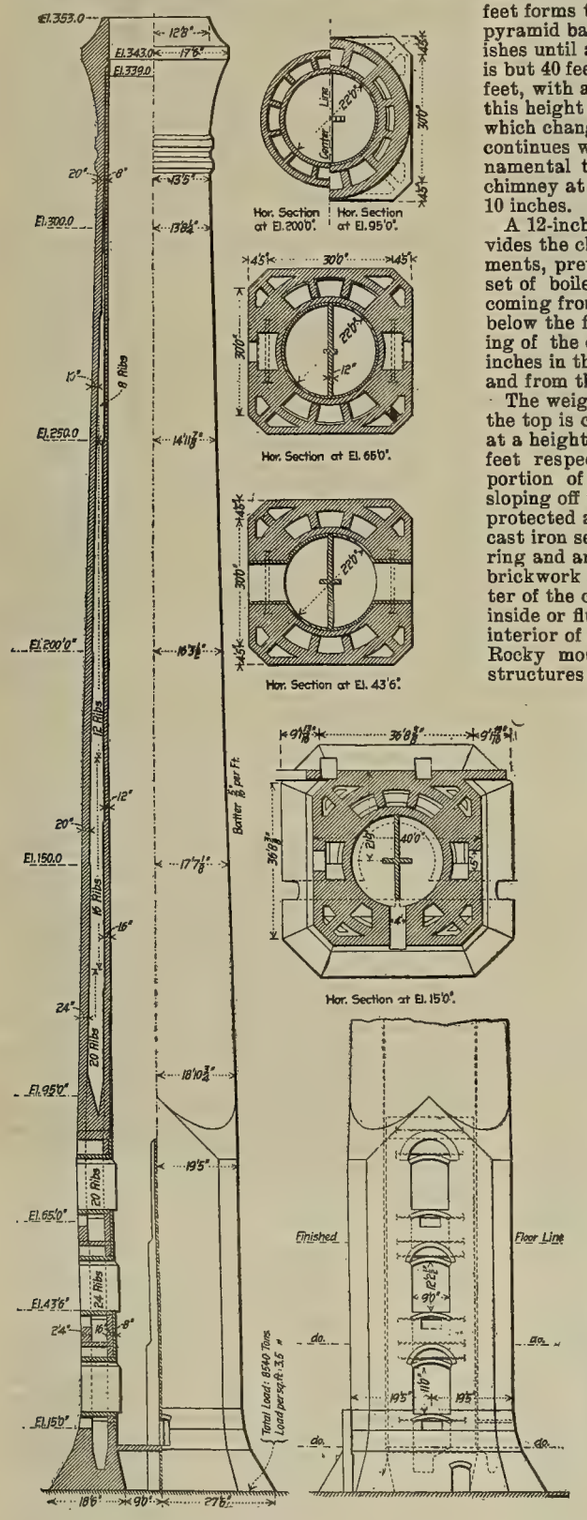


FIG. 1.

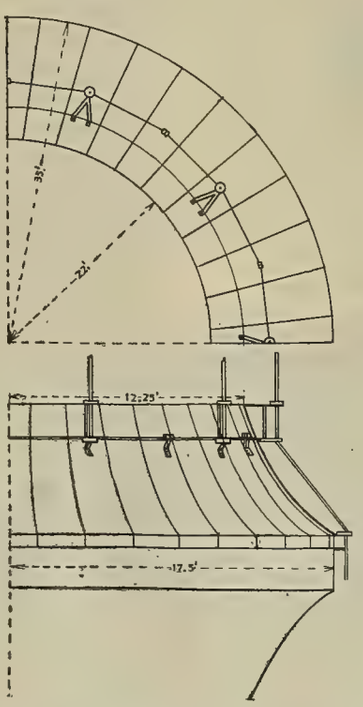

FIG. 2.

This is a mistake. The height of that chimney is 265 feet; it contains 1,250,000 bricks, is 44 feet outside diameter at the base, and cost about $15,000.

The tallest chimney in the world is believed to be in Glasgow, Scotland, 474 feet high, though the one at Hutte, Saxony, has some claims that way.

The subject is deemed of sufficient interest to justify illustrated mention of the largest brick chimney in the world, in New York City.

There is now building there an unusually large electric power station for the Metropolitan St. Railway Co. The intent is to make this and the one for the Third Ave. Railway Co. the largest in the world, to concentrate all the current-generating machinery, and to introduce a system of economical generation and transmission of electric power. Incidentally it may be mentioned that the power house, when fully equipped, can carry 75,000 H. P. It will contain eighty-seven water-tube boilers, each of a maximum capacity of 800 H. P. The engine room will contain eleven engines, each direct-connected to a three-phase, 6000-volt generator. A. M. Hunt of San Francisco is now inspecting that plant with a view to its duplication for Claus Spreckels' new electric light and power establishment in San Francisco.

But it is of the chimney construction that detail is intended.

A side elevation and a plan of the sections is shown in Fig. 1. A solid block of concrete 88x85½x20 feet forms the foundation. Starting with a square pyramid base 55 feet on a side, it gradually diminishes until at a height of 15 feet from the ground it is but 40 feet, from which point it continues up to 80 feet, with a side dimension of 38 feet 10 inches. At this height it begins to change to a circular section, which change is completed at 95 feet, from whence it continues with a taper of $\frac{5}{16}$-inch to the top. The ornamental top begins at a height of 317 feet, the chimney at that point having a diameter of 26 feet 10 inches.

A 12-inch firebrick wall extending up 85 feet divides the chimney into two semi-circular compartments, preventing the current of hot gases from one set of boilers having any influence upon the gases coming from the flues on the other side. About 4 feet below the floor of the lowest flue, the firebrick lining of the chimney commences and extends about 8 inches in thickness to 5 feet above the upper flue, and from there 4 inches in thickness up to 115 feet.

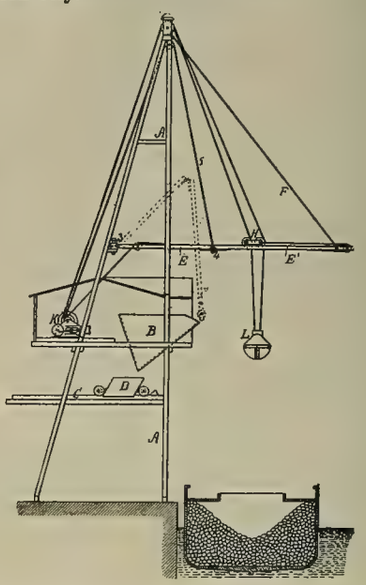
The weight of the overhanging enlarged portion at the top is counteracted by three steel rings, the first at a height of 335½ feet and the other two at 3 and 6 feet respectively above the first. In the thickest portion of the cap the brickwork is 6½ feet thick, sloping off to 20 inches at the top. The chimney is protected at the top by an iron cap made of forty cast iron sectors, bolted together into a complete ring and anchored to a steel ring embedded in the brickwork about 14 feet below the cap. The diameter of the cap at its widest portion is 35 feet and the inside or flue diameter is 22 feet, or the same as the interior of the chimney all the way up. East of the Rocky mountains it is necessary to protect all structures from being struck by lightning. The big brick chimney is well protected that way, as shown in Fig. 2, by ten copper rods 1¼ inches in diameter, projecting 6 feet above the top of the point, terminating in four pronged points, each tipped with platinum for about 2 inches. A heavy copper band encircles the cap at the base of the rods and at two points opposite, two copper strips, 1x$\frac{5}{16}$-inch, lead down the sides of the chimney to suitable ground-plates. A total length of 1030 feet of lightning conductor was used. Encircling the inner edge of the cap, a second copper strip has been placed with a ground connection, thus affording a double protection. Such protective expense is rarely deemed necessary on the Pacific coast. It is understood that the cost of the chimney is about $100,000, and the cost of the induced-draft plant will be about one-third of this. Recently was given some account of the induced-draft system, which is intended to do away with the need for such high chimneys as the one herewith described.

Latest Mining and Metallurgical Patents.

Patents Issued April 4, 1899.

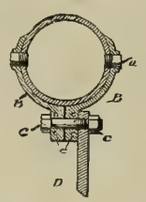
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

HOISTING APPARATUS.—No. 622,227; C. W. Hunt, New York City.



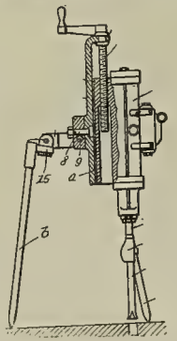
A combination with stationary track, car and pulleys and ropes or chains thereon adapted to raise and suspend a weight, of a boom having a track that is a continuation of the stationary track, a support for the outer end of the boom, a hinge for connecting the inner end of the boom at the stationary track and a joint between the two parts forming the boom and means for drawing up the latter joint to fold the boom. There is a combination with stationary support, of boom joint for connecting the boom to the stationary support, and upon which the boom can be swung horizontally or folded upwardly, means for sustaining the outer end of the boom, a hinge for uniting the two parts of which the boom is composed, means for moving the hinge upwardly in folding the boom, and a track upon the boom with a truck running thereon.

RABBLE ARM FOR ORE ROASTING FURNACES.—No. 622,233; J. Jacobs, Florence, Colo.



A combination with a hollow cylindrical rabble arm, of studs projecting from the periphery thereof; a two-part yoke embracing the arm and having openings which encircle the studs to form engagement therewith against displacement in any direction; a blade independently mounted upon the lower portion of the yoke; means for securing the two portions of the yoke together and for holding the blade in position thereon.

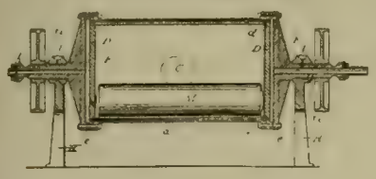
SUPPORTING TRIPOD FOR ROCK DRILLS.—No. 622,264; J. H. Rhodes, Harvey, Ill.



A supporting tripod for rock drills comprising a frame consisting of a couple of side braces connected by a crossbar; three adjustable leg holders, one pivotally connected to and between the rear ends of braces; the others pivotally connected respectively to the forward ends of the two side bars, and three adjustable supporting legs held by leg holders; each leg holder consisting of a circumferentially broken or split socket adapted to receive a lateral projection on the upper end of a supporting leg, and being

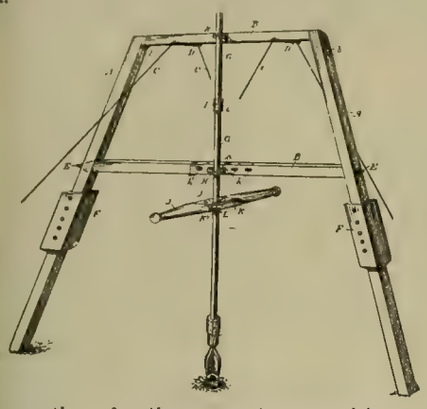
connected to the frame by a pivot bolt which passes through the separated end portions of the socket comprising holder, whereby a loosening of the nut of bolt permits the leg to be swung from side to side and also from front to rear, and a tightening of the same locks the leg in both adjustments.

METHOD OF AMALGAMATING ORES OF GOLD AND SILVER.—No. 622,295; J. E. Sutphen, Albany, N. Y.



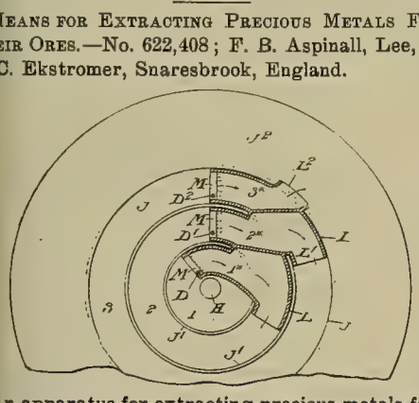
A method of amalgamating ores of gold and silver, which consists in applying a suitable quantity of ore pulp confined in a cylinder, and subjecting such pulp and mercury to the action of heat, and at the same time applying a steady pressure upon the pulp and mercury, keeping the mercury in a homogeneous body and in close contact with the ores.

DEVICE FOR PENETRATING FROZEN EARTH OR GRAVEL.—No. 622,365; T. J. Hubbell, Santa Cruz, Cal.



An earth-perforating apparatus comprising a perforating tool, a shank and means connecting it therewith, a framework having upper and lower cross timbers, and upper and lower guides carried by cross timbers and through which guides the shank loosely passes, one guide fixed and the other adjustable to bring it in the vertical line of the fixed guide when the frame of the apparatus is set upon an incline; a supporting frame including foldable side members and connecting cross timbers, a boring tool and a shank to which it is detachably connected to bring a transverse handle having a vertical slot or channel in one side to fit said shank, and a pivoted latch or keeper for closing the slot or channel and locking the shank in place.

MEANS FOR EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 622,408; F. B. Aspinall, Lee, and E. C. Ekstromer, Snaresbrook, England.

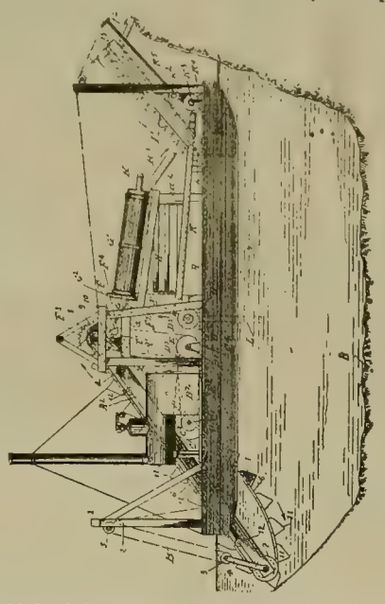


An apparatus for extracting precious metals from their ores comprising a tray divided by partitions into annular troughs, a closed vessel within which tray rotates, a plow containing a series of inclined passages leading from one to another of troughs over their dividing partitions, a nozzle in the mouth of each passage, means for supplying pulverized ore to tray and means for supplying mercury fumes through nozzles into passages, all in combination.

MINER'S DRILL.—No. 622,409; H. Aylmer, Richmond, Canada.

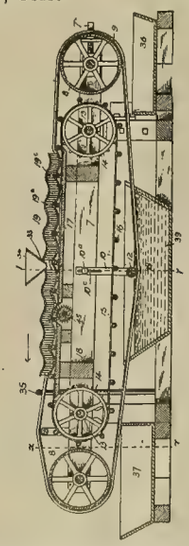
In a drill, the combination with the body proper provided with a dovetailed groove extending across the end and transverse side notches extending into the groove in the center of the sides, of the drill point having a dovetailed portion adapted to fit the groove and a central hole adapted to aline with the notches, and a pin extending through the notches and central hole in the point.

GOLD DREDGING APPARATUS.—No. 622,532; Robert H. Postlethwaite, San Francisco, Cal., assignor to the Risdon Iron and Locomotive Works, same place.



A gold dredging apparatus, combination of dredge boat, swinging ladder mounted at one end thereof, endless carriers supported by ladder, cutting or excavating buckets secured to or carried by endless carrier, devices for raising and lowering the elevator, mechanism for driving the endless carriers, the inclined rotary grizzly, a trough or runway for conveying the excavated material from the excavating buckets to the grizzly, a force pump for supplying water into the grizzly to wash and separate the material fed therein, a series of separating plates or platforms arranged at an incline below the rotary grizzly, a sump or well formed in the dredge boat, the sluiceway leading from the platforms or tables to the sump or well, the discharge pipe for conveying the material from the sump, a bucket elevator mounted upon a movable ladder for removing the heavier material, a runway for conveying the heavier material from the rotary grizzly to the bucket elevator, and of devices for raising and lowering the elevator ladder and the discharge pipe. The pump and connections empty the well, the discharge pipe is connected to the pump by a universal joint, the bucket elevator works over a movable ladder. There is a perforated spray pipe leading into the separator or grizzly from the lower end thereof, a pump for forcing water into the pipe and through its perforations and under disintegrating pressure onto the material fed into the grizzly or separator, collecting tables arranged below the separator or grizzly and by means of which the separated metal from the dredged material is recovered.

ORE CONCENTRATOR.—No. 622,641; August Ten Winkel, Denver, Colo.

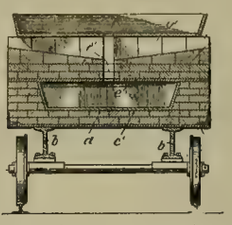


An ore concentrator combination of table, endless apron traveling above the table, agitators traveling between the table and the apron and engaging the latter underneath, apron sufficiently slack to form valleys or depressions between the agitators, an auxiliary apron attached to the table and engaging the endless apron from above for the purpose of maintaining the transverse valleys in the endless apron, and facilitating the separation of the mineral from the gangue, the auxiliary apron being divided to permit the material to be fed to the endless apron at a suitable point between the extremities of the auxiliary apron.

ORE WASHER AND SEPARATOR.—No. 622,507; J. F. Mason, Waycross, Ga.

A combination of a horizontally arranged shaft, a cylindrical screen rigidly secured thereto, a trough journaled upon shaft beneath screen, means for rotating shaft and screen, and for simultaneously rocking trough in a path parallel to screen during the rotation of the shaft, a spout entering one end of the screen for delivering the ore and water thereto, and means for rotating the shaft.

METALLURGICAL FURNACE APPLIANCE.—No. 622,438; W. Beam, Gill Hall, Pa.



A crucible supporting structure for furnaces, comprising a refractory base portion having a chamber, a removable cover resting on base portion and apertured over the chamber, a refractory crucible bed built upon cover and apertured to correspond therewith, the bed having risers with passages therebetween for products of combustion, the bottoms of the passages sloping toward the apertures in the bed.

Copper Ores, Etc.

Written for the MINING AND SCIENTIFIC PRESS.

Copper is in demand, and as a result every sort of mineral having a bluish or greenish color is considered copper by inexperienced prospectors. A few days since a mass of serpentine was exhibited in San Francisco, on the faces of which was a thin coating of green carbonate of copper. This was represented to be very high-grade ore. It would perhaps assay a fraction of one per cent copper. In times like these wad becomes black oxide of copper and red iron oxide is cuprite. Mariposite or any other green mineral is at once malachite, etc. The range of copper ores is a very wide one, but the principal ores become familiar after a brief acquaintance. The most common are the green and blue carbonates and the yellow sulphide (chalcopyrite). A good test for copper is to boil the pulverized mineral in nitric acid. A green solution will result if copper be present. To further prove it, add ammonia in excess, when the solution becomes a beautiful blue. This color will disappear upon the addition of a solution of cyanide of potassium.

THE Mansfield Copper Mining Co., Germany, have introduced at their Otto mine two machines for lifting the mine cars. These lifting cylinders are worked by compressed air, effecting a quicker and easier transfer of the cars from one track to another than was possible with the hoisting screw previously in use. A compressed air cylinder is arranged upon a movable frame suspended at a height of 6 feet 8 inches. The frame can be moved on the rails with ease, the air being supplied by an indiarubber hose. The piston rod of the air cylinder is connected to an arrangement of levers for seizing and lifting the wagon as soon as the air valve is opened. The releasing and lowering of the wagon is effected by opening the exhaust valve.

JAMES P. WILLIAMS of Milldale, Ohio, has secured a patent for a device which he claims will prevent collisions on railroads. It consists of an electric dynamo which is placed under the trucks of all engines and operated on the principle of the generation of electricity by induction. Williams claims that the two trains will become cognizant of the presence of each other on the same track at three miles distance by an arc light in the cab of each engine.

INDIAN maize contains a kernel in which there is a yellow germ. Under chemical treatment this germ yields an oil which, when refined, is a competitor with cotton seed oil in the substitution for olive oil, and which may be vulcanized and made to do duty as rubber. What are called rubber boots and shoes are being made from this imitation rubber at a cost far below that of the genuine article.

Development of Submarine Telegraphy.

The development of the submarine telegraph from a mere gutta percha coated wire laid in New York harbor by Prof. Morse in 1842, to the great cables which now engirdle the entire earth, except the bed of the Pacific, is described in a statement just issed by the Treasury Bureau of Statistics entitled, "Chronology of Submarine Telegraph Construction Throughout the World and the Development of Submarine Telegraphy." This publication, which has been prepared by the Bureau of Statistics in view of the special interest just now developed in a submarine telegraph line to connect the United States with Hawaii, Guam, the Philippines and the Asiatic coast, shows not only the location, number and length of the submarine telegraphs of the world, but also the history of this great system and the part which American genius and enterprise have had in its development.

The statement credits Salva, a Spaniard, with the first recorded suggestion of submarine telegraphy, made before the Barcelona Academy of Sciences in 1795. Aldini, a nephew of Galvini, performed experiments in the transmission of electric signals under the sea near Calais, France, in 1803; Schilling ignited gunpowder by electricity transmitted through subaqueous conducting wire under the Neva river near St. Petersburg, in 1812; telegraphic signals were transmitted through insulated wires under the river Hugli, in India, by the director of the East India Co.'s telegraph system in 1839, and in 1842 Prof. Morse transmitted electric currents and signals through an insulated copper wire laid for that purpose between Castle Garden and Governor's Island, in New York harbor, and in the following year suggested submarine electric communication between the United States and Europe. In 1845, Ezra Cornell, in conjunction with Prof. Morse, laid and successfully operated submarine copper wires in the Hudson river between New York and Fort Lee, and in 1847 a section of the telegraph line connecting New York and Washington was laid through the waters of a narrow creek by J. J. Craven of New Jersey, thus demonstrating the practicability of actual submarine telegraphic service. In 1850 a submarine telegraph line was laid across the English channel and signals exchanged, but without further success, though in the following year a cable containing four copper wires insulated with gutta percha and protected by galvanized iron wires wound spirally about it was laid across the English channel and put into successful operation as a submarine telegraph line.

These experiments having proved the practicability of submarine telegraphy, the great enterprise of a telegraph line under the Atlantic ocean was undertaken, and the subsequent developments are described in the statement as follows:

1857.—First attempt to lay a submarine telegraphic cable across the Atlantic ocean, the enterprise being headed by Cyrus W. Field of New York, and Charles Bright, J. W. Brett and others of England. The cable was to extend from Valencia, Ireland, to Newfoundland, the length of cable necessary being estimated at 2500 miles. The construction of this cable was similar to that across the English channel. After 225 miles had been laid from Valencia westward, the cable broke and the work was abandoned.

1858.—Renewal by Mr. Field and his associates of the attempt to lay a submarine telegraphic cable across the Atlantic. The United States naval vessel Niagara and the British vessel Agamemnon, carrying each one-half of the cable, proceeded to mid-ocean, and after joining the ends of their respective sections, on July 29 proceeded westward and eastward, paying out the cable and reaching their respective destination, Newfoundland and Valencia, on the same day, August 5th, 1858, when electrical connection between the continents was at once established over 2050 nautical miles of cable which they had thus laid. Congratulatory messages were exchanged between the President of the United States and the Queen of England, and there were public rejoicings in both countries over what was pronounced the great event of the century. After less than one month of operation, however, the cable ceased working and it was never operated further, nor was any part of it ever recovered. During the time of its operation 730 messages of about 10,000 words were passed over it. Its total cost was $1,256,250.

1859.—A submarine telegraphic cable to connect England with British India was laid through the Red sea and Arabian sea to Kurrachee, India, having a total length of 3043 nautical miles, but with several intermediate landings. Some portions of the line worked satisfactorily for thirty days, but few if any messages were sent over the entire length, and it soon proved a complete failure.

1860.—Elaborate study of the entire subject of submarine telegraphs and the construction of cables was made by a committee appointed by the British Board of Trade, resulting in an expression of the belief that submarine telegraphy might, despite past failures, become successful and profitable if sufficient care were exercised in constructing, laying and managing the cable.

1861.—A submarine telegraphic cable, which had been manufactured with great care, was laid across the Mediterranean from Malta to Alexandria, Egypt, with intermediate landing places at Tripoli and Benghazi. The cable consisted of seven copper wires stranded together, covered with several coatings of gutta percha alternated with other nonconducting and waterproof material, and in turn covered and protected by eighteen wires wound spirally about this core. This cable proved a permanent success and went into general operation shortly after its construction. The speed of transmission, which on the Atlantic cable and shorter submarine lines had been three words per minute, was brought up to ten words per minute on each separate section, but was only three words per minute when all the sections were united and operated as a single line of 1331 miles.

1862.—A submarine cable which had been laid across the Mediterranean sea between France and Algeria in 1861 proved a complete failure after a few months of experiment.

1864.—Construction of a cable line to connect India with England untertaken by the Indian Goverment, the line to be laid through the Arabian sea and Persian gulf to connect with land lines, thence to Calais and by the short submarine line under the British channel to England. The submerged line in the Arabian sea and the Persian gulf had a total length of 1450 miles, but with three intermediate landing places. This line consisted of a copper core surrounded by layers of gutta percha, alternated with other nonconducting and waterproof material, being protected by an outer sheathing of twelve galvanized iron wires wound spirally about it, which in turn were protected by double wrappings of tarred hemp yarn. All of these materials and the various sections of the cable were constantly and thoroughly tested electrically and otherwise during its construction. The line when laid proved a complete success, becoming the first successful telegraphic connection between England and India.

1865.—Another attempt was made by Cyrus W. Field of the United States, and his associates in the United States and England, to lay a submarine telegraph cable from Valencia, Ireland, to Newfoundland and the United States. The cable, for which the contract price was $3,000,000, partly in cash and partly in shares of the company, consisted of seven copper wires surrounded by numerous coatings of gutta percha and other waterproof nonconductors. This was in turn surrounded by ten Bessemer steel wires, this being the first use of steel wires for cable protection, each wire being separately wound with pitch-soaked hemp yarn, the shore ends being also further protected by thirty-six heavy iron wires wound spirally about the completed cable. The steamer Great Eastern, then the largest steamship afloat, was specially fitted up for laying this cable. Great care was exercised in every particular, but after 1186 miles had been laid westward from Valencia the cable broke in water over 11,000 feet deep and the attemts to recover it were unsuccessful.

1866.—Mr. Field and his associates renewed their efforts to lay a cable across the Atlantic. A new company with $3,000,000 capital was formed with the double purpose of attemping to find the end of the cable partially laid in 1865 and complete the line, and also to lay another cable parallel with and near to it. The cable manufactured for the proposed new line was similar to that of 1865. The Great Eastern was remodeled to further meet the requirements of the work, and left Valencia, Ireland, July 13, 1866, paying out the cable in a line about twenty-five miles north of that followed on the preceding year. She safely arrived at Newfoundland in fourteen days from the date of leaving Valencia, and electrical communication was immediately established between the United States and England, which has never since been more than temporarily interrupted. The Great Eastern then returned to the spot where the cable was lost in 1865, and after eighteen days work succeeded in bringing the end on board from a depth of over 11,000 feet, the tests immediately made showing it to be in perfect working connection with the Valencia end. A splice was made and the laying of the line toward Newfoundland resumed and on September 8th the cable was landed at that point and the second successful line of communication between the United States and Europe thus completed, Newfoundland being already in submarine telegraphic communication with the mainland and telegraph systems of the United States. The length between Trinity bay, Newfoundland and Valencia, Ireland, is given by the American cyclopedia at 2143 miles. The rate of speed in transmission over these cables was at the beginning eight words per minute, but increased to fifteen words per minute.

The success of the 1866 cables so completely demonstrated the practicability of submarine telegraphy that its progress thenceforward was very rapid. A second Anglo-Mediterranean line was laid from Malta to Alexandria in 1868, proving a complete success; a cable between France and Nova Scotia was laid in 1869, and another from Suez to Bombay, India. In 1871 a cable line was laid along the eastern coast of Asia to connect with land lines already constructed across Siberia and Russia. These land lines had been built shortly after the failure of the first Atlantic cable experiment in the hope of connecting Europe and America by the way of Siberia, Bering straits, Alaska, British America and the United States, but that plan becoming unnecessary after the success of the 1866 cable experiments, the land line across Russia and Siberia was utilized to connect a cable system of the eastern shore of Asia with the land and cable systems of Europe and America. In 1873 South America was connected by cable with the United States and thence with Europe; in 1875 cables were laid along the coast of Africa, connecting its important points with Europe and America; in 1880 cables were laid across the Gulf of Mexico and along the western coast of South America and connected by an overland line across the Isthmus of Panama. The invasion of the Pacific has been already begun by the construction of lines extending from Australia 1200 miles southeastwardly to New Zealand and 800 miles northeastwardly to New Caledonia, but leaving the Pacific the one great body of water which has not yet been completely spanned by submarine telegraph wires. This it is believed is now practicable, since the distance between the four landing places now under the control of the United States, Hawaii, Wake Island, Guam and the Philippines, is in each case less than that through which submarine cables are now being daily operated between France and the United States.

The Cost of a Train Mile.

It is difficult to state just what constitutes a train mile. On some roads a great deal of extra or helping mileage is necessary, which makes double engine mileage; others figure differently. Many roads reckon train mileage according to the mileage of train crews; the "run" of a conductor one way is called a "train." This is probably the simplest way of stating train mileage.

The question of train mile cost is interesting and worth noting. The table which follows gives the cost per train mile of the various items of expense, governed by train mileage more or less directly. In dividing certain expenses between passenger and freight, arbitrary methods have necessarily been adopted, but there is not much difficulty in getting a basis of fair division. We give the cost per freight-train mile:

	Cost per train mile.
1. For enginemen, firemen, fuel and supplies	22.138c
2. For repairs of locomotives	8.064c
3. For repairs of cars	19.880c
4. For certain items of maintenance of way	4.135c
5. For train service and supplies	11.564c
6. For superintendence, loss, damage, miscellaneous, etc.	6.006c
Total	71.787c

The passenger-train mile shows the following cost for the same items:

	Cost per train mile.
1. For enginemen, firemen, fuel and supplies	11.250c
2. For repairs of locomotives	6.082c
3. For repairs of cars	7.990c
4. For certain items of maintenance of way	4.043c
5. For train service and supplies	5.672c
6. For superintendence, loss, damage, miscellaneous, etc.	5.888c
Total	40.925c

Correct Mining Blanks a Necessity.

To the Editor:—In a recent application for a quartz patent from this county the department has hung up the case and sent back all the papers because the original location certificate did not set forth on its face that the locator "was a citizen of the United States or had declared his intention to become such." The blank form should contain this statement, basing the argument on the necessity that a man who takes advantage of a privilege accorded him should make out a prima facie case of being qualified to receive such benefits. Many of the customary blanks sold are no good. They omit this statement, the locator never by any chance puts in any more information than the printed form calls for, and if this case is a precedent every patent application based on these forms will sooner or later be thrown out and sent back to have the missing facts supplied (if they can be), and at best delay will be caused. If the location was by a transient, who has been lost sight of and who never came upon the voting register, it will be impossible to correct the record, the location fails and all proceedings based upon it become void. Prospector.

Coulterville, Cal., April 3rd, '99.

Rossland, B. C., is the only place thus far heard from where the new eight-hour law will not be likely to cause strife. The mine managers have decided to accept the law in its spirit and intent and will reduce the hours of work to eight, but will attempt no reduction in pay. One reason for this probably lies in the fact that the scale of wages at Rossland has been somewhat below that of other districts in British Columbia.

Mining Summary.

ALASKA.

Minook creek is said to be disappointing, many claims proving almost valueless. The miners are leaving for other diggings.

B. C. Mining Journal: Gold Run, a creek in the Atlin lake region, is reported rich. Pan prospects have been obtained as high as $2.50. The gulch is fed by two glaciers and is about seven miles long. The usual rush which follows each new find is on.

ARIZONA.

A railroad is to be built from near Kingman to Chloride.

Supt. Grant has commenced work on the Mollie Gibson mine at Chloride. The main shaft will be sunk deeper. It is 90 feet and the ore extends nearly across the shaft.

Russell & Ziemer's gold mine in Todd Basin is producing ore in large quantities.

T. L. Ayers has let a contract to Burns & Joyce to sink the main shaft on the Eureka 100 feet deeper. The shaft is now down 236 feet.

The Elkhart shaft at Chloride will be sunk to 1000 feet.

Three shifts of men are working on D. Bean's mine at Sheep Trail, near the Colorado river.

At Tucson the Twin Buttes copper mines were reported sold on the 8th to a Boston and New York syndicate for $100,000, 10% of the purchase price being paid. The Butte mines are eight miles south of the Azurite copper bullion producing mines. It is intended to at once equip the mines for matte production.

A rich vein of copper ore is reported fourteen miles east of Ehrenberg. It had been dug over and run through dry washers for gold in the decomposed quartz and copper ore. Frequently placer workers would find chunks of copper ore, but made no exploration. L. F. Bradshaw started a shaft and found the copper continued down. It contains one ounce to the ton in gold, besides the copper.

There is a report of a strike in Hassayampa district of a ledge 1 foot wide which assays from $300 to $750 a ton and twenty-six ounces in silver. The mine is the Tip Top, owned by J. Shull and J. Phillips of Prescott.

Tombstone *Prospector*: J. Miller's new strike two miles east of Russellville resulted in the sale of a group of ten wolframite mines and shipping to a concentrator will commence at once. The ore will run 70% iron tungstate. Work heretofore has been confined to a few owners.

Kingman *Miner*: D. C. Lane, formerly of Banner, Cal., has bonded and is reopening the Dean mine in the Hualapai mountains, fifteen miles east of Kingman. The mine was formerly worked extensively.——There are several shafts in the White Hills district from 500 to 700 feet deep. The Daisy has a tunnel driven entirely through Sunset peak, and the vein worked to the surface.

Tombstone *Epitaph*: The Copper Queen Co. are sinking a new shaft about a half mile east of the middle shaft, called the Holbrook. It is understood that the company intend to go 700 feet in this new shaft.

CALIFORNIA.

Amador.

It is reported that the control of the Central Eureka mine, near Sutter Creek, has passed to E. & J. C. Coleman, formerly of the Idaho mine, Grass Valley.

Amador *Record*: The Ranlett copper mine, at Newton, is to resume operations.——The Tellurium quartz mine, at Pine Grove, has been sold to French capitalists, who will operate it.

Calaveras.

(Special Correspondence).—In and about Murphy prospecting and mining are active, owing to the recent rains. East of Murphy at Collierville the two 2-stamp mills are running on high-grade ore, taken from the old Collier mine, now called the Blood mine. The property is owned and worked by representatives of the Santa Cruz Powder Co. They own several other mines in the vicinity, including the Deer Lodge. Men are now at work on this mine taking out a milling test. If satisfactory, a large mill will be put on the mine.

There is some excitement over a recent rich strike on San Antonio ridge, three miles below Sheep Ranch, near the Campbell mine. Part of the rock is sacked as taken out.

Work has been resumed on the Big Horn mine on San Domingo.

Murphy, Cal., April 6th, '99.

A. Granda was killed at the Utica mine on the 3rd inst. in a strange manner. He was climbing a ladder with six sticks of powder on his shoulder, which were ready for use. In some manner one of the fuses took fire from the lighted lamp in his hat and the explosion followed, blowing him to pieces.

Calaveras *Chronicle*: A 4-stamp mill has been built at the old Collierville mines, five miles east of Murphy's. The mill is equipped with electricity, concentrators, canvas plant, etc. The mine is worked through tunnels, the ore being sent to mill by tramway.——S. H. Lucas is successfully operating the Gladiator mine, near the Blue Lakes electric plant, on Mokelumne river, above Big Bar bridge.

Calaveras *Citizen*: It is reported that the Poorman mine, near Glencoe, is to be reopened.——The McNear mill, near Murphy's, has started on a run of several hundred tons of rock from the Red Gold mine, being worked by Hurd, Bunny & Scantleberry.

Del Norte.

The *Record* hears that the Union copper mine near Low Divide will be reopened and worked by Eastern people, who have been investigating.

El Dorado.

Placerville *Nugget*: The American River mine, owned by Casey & Son, has made its first mill run, realizing $7 per ton. The mine is opened by a tunnel 140 feet long, at the face of which the vein is 10 feet wide.

Placerville *Democrat*: The report of the sale of the Gentle Annie, near Placerville, was premature. Negotiations are about completed, however. The prospective purchasers are an Eastern company. It is reported they will erect a 40-stamp mill.

El Dorado *Republican*: The new 5-stamp mill of the Cambrian M. Co., at Gold Hill, is running. The power is water.

Placer *Argus*: H. S. Chapman has completed a cyanide plant at the Taylor mine and will begin working sulphurets, of which there is a large quantity. No other work is at present being done at the mine.

Inyo.

Bishop *Register*: R. & E. Blake have a discovery near the summit, southeast of Big Pine, which makes a good showing.——G. Sanger is shipping ore from his mine below Waucoba. About 100 tons of silver-lead ore are now out.——A representative of the North American Development Co. has gone to inspect copper claims ninety miles from Big Pine, across the White mountains.——The outlook for the region in Mazourka canyon, opposite Independence, is good. It has already turned out considerable gold. —— Johnson Bros. & McGinnis have opened a prospect in the Inyos east of Independence. They have been working several weeks on a ledge of 10 feet, that shows assay of $20 and over.——Barnes & Anderson have a 4-foot ledge north of the Johnson location which shows free gold. A carload will be sent to Dayton as a test of the average of the ore.

Kern.

Californian: An antimony mine in Jawbone canyon, northeast of Mojave, has been sold in Bakersfield for $12,000 spot cash. A. Blanc of Oakland is the buyer, G. Aitkin and R. Irwin the sellers.

Randsburg *Miner*: The shaft in the gravel deposit near the St. Elmo mine, six miles south of Randsburg, reached bedrock at 32 feet. The bedrock rises north and south, indicating a depression or channel having an east and west direction. The roof of the workings is a cemented material which requires little timber to support it. The pay streak varies from 1 to 3 feet in thickness. The first car milled at Barstow induced further effort, and two cars were afterward crushed in the Red Dog mill at Johannesburg. Three cars will be sent to Barstow. Others are at work prospecting and it looks as though that section sloping east from the Stringer mines might be underlaid with pay gravel. The gold is coarse and bright. These mines are west of the side line of the St. Elmo mine.

Los Angeles *Mining Review*: Two prospectors, Pitzel and Jay, have located a rich vein east of the Stringer district and two miles from Randsburg. The vein has increased from 6 inches to 1 foot in sinking a 25-foot shaft. The ore is high grade.——The Spangler mine near Garden Station shipped a carload of ore to San Francisco. The ore from the mine runs from $80 to $100, but it neither amalgamates nor cyanides, therefore the smelting process had to be resorted to.

Lassen.

(Special Correspondence).—Hayden Hill is a mass of eruptive rock of felsitic character. Its altitude is about 6500 feet above sea level. It is the center of the only mining operations of consequence in the county. The greater part of the county is covered with lava flows which obscure the underlying rocks which may be mineral bearing. Timber and water are scarce and the winters usually severe and the snowfall heavy. The mines of the district are credited with a production exceeding $2,000,000. The mines are worked to a depth of about 300 feet, and the pay ore is usually rich. The hill appears to be a network of fissures in a number of which are mineral veins. The district requires capital for development.

Susanville, April 10th, '99.

Los Angeles.

Mica has been discovered near Acton by prospectors.

A new quartz mill has been set up in Tejunga canyon for prospecting veins of the vicinity.

Madera.

Merced *Star*: E. J. Olds is putting in pumping machinery at his copper mine near Buchanan.

Fresno *Republican*: The new hoisting works at the Gambetta at Grub Guch are completed and the owners will sink 1000 feet before taking out any ore except what is encountered in sinking.——The Lucky Bill mine on Potter Ridge has been bonded for $40,000 and fifteen men are at work sinking.

Marin.

The Golden Crown M. & M. Co. are shipping forty tons of sulphide copper ore from their mine in Union gulch, near Bolinas bay, to Selby Smelting Works. The ore contains gold, silver and copper. The ore occurs in the bluish gray sandstone common to the Coast Range and is near a mass of serpentine.

Nevada.

At Trenton, N. J., on the 10th, the North Star Mines Co. was organized with a capital stock of $5,000,000; "to control and operate the business and property of the Grass Valley Water Co. of California and to carry on a general mining business." The incorporators are J. D. Hague, A. G. Agnew, W. L. Bull and W. D. Pagan of New York and B. Strong of Montclair, N. J.

Grass Valley *Union*: It is rumored the London Exploration Co. has bonded a group of ten claims on the south side of Osborne hill near Grass Valley. The claims include the Ben Franklin and Lafayette. Contracts have been let for extending the tunnels on these claims. The same company is also negotiating for claims near the Allison Ranch mine on Wolf creek.

Nevada City *Herald*: A cave in the Reddick mine, near Nevada City, occurred on the 9th inst., imprisoning two miners at the bottom of the shaft. The water commenced to fill the shaft, the men climbing upwards to the cave. They were released in a few hours without injury.

Grass Valley *Union*: The Central mine, formerly the Greenhorn, at Grass Valley, is to be reopened and developed by a Los Angeles company, under the direction of Mr. Bailey. Arrangements are being made for building a new mill.——The Brunswick mine, near Grass Valley, in January cleaned up $12,093, in addition to a quantity of sulphurets. The mine was idle during February, owing to necessity of laying a new pipe line. The March cleanup has not been made public. Seventy men are on the payroll.

Placer.

Gen. Mgr. Buckminster, who has returned from the Santa Ysabel mine, tells the Boston News Bureau that No. 1 shaft will be made a three-compartment shaft and hoisting machinery erected, including a large air compressor. There will be twenty additional stamps, and the entire forty stamps should be at work July 15th. The enlargements and improvements contracted for may cost $35,000. There is about $40,000 in the treasury. The operating cost is figured to average $4 a ton. About eighty men are employed.

Herald: On the west side of Duncan canyon, south of Bald mountain, the Hutchinson mine has been in operation all winter. They now have water to wash the dirt and will ground-sluice the front. Three-fourths of a mile northeast the Pine Nut Co. will resume work in their bedrock tunnel and will complete it by fall. One mile northeast is the Blue Eyes mine, fitted up for hydraulicking. The bedrock having pinched off indicates a lower channel. No washing was done last year, owing to the dry winter. The company placed flumes and appliances in order last fall and made an addition to the canyon flume, and now will begin work. One and a half miles northeast from the Blue Eyes the Lucinda Con. Gravel M. Co. have fitted up to ground-sluice and prospect at several points this spring.

Colfax *Sentinel*: At Pioneer mine, near Damascus, the work of repairing the flume is in progress. Sinking in the No. 4 tunnel has reached the 1250-foot level. There are fifty-five men on the payroll.——The 5-stamp mill at the Mountain Maid mine, on the You Bet road, three miles from Colfax, is running steadily. It is now owned by Dr. C. Pusheck. ——J. N. Findley is hydraulicking at the Trafton mine at Georgia hill, near Yankee Jim's.

Leader: W. Nicholls, Jr., is running two monitors, using 2000 inches of water at his Polar Star mine at Dutch Flat.

Plumas.

Genessee valley has gold, copper and coal among its mineral resources. Coal was discovered a year ago. The Genessee quartz mine has been successful. Efforts are being made to construct a narrow-gauge railroad connecting the coal and the copper deposits.

The Plumas Development Co. has purchased mining ground on the ridge between La Porte and Gibsonville. The purchase comprises the Young America, St. Louis Con., Diamond Spring and Yankee Hill claims. Preparations for mining this season are well under way. Ten tons of pipe will soon be conveying water to Yankee Hill, where the first opening will be made.

National Bulletin: F. Scott is operating the Scott drift mine on North Fork, situated on the Big Flat channel.——Adjoining this property is the Cameron mine, which has developed into a paying proposition.——C. Bressler is driving a tunnel into the Malvern Hill mine.——Savercool Bros. continue operations at Dutch Hill.——At the Pliocene drift mine, recently purchased by Salt Lake capitalists, six men are employed.

Riverside.

Corona *Review*: A deposit of kaolin at the mouth of Paint Mine canyon has been discovered which is suitable for making the finer grades of pottery. It contains very little iron.

San Bernardino.

(Special Correspondence).—As iron ores seem to be much in demand, it may be well to call attention to the large deposits of iron ore in this county. They are in the West Lava Beds district, about twenty miles from Newberry station, in a southwesterly direction. The deposits are very large and are both hematite and magnetic. Some years since iron ore experts from Cleveland, Ohio, and Pittsburg, Pa., examined these ores and pronounced them high-grade and containing a very low percentage of sulphur and phosphorus. No determined or systematic effort has ever been made to make these deposits available. The distance to tidewater by present rail facilities is less than 200 miles.

Daggett, April 10th, '99.

Coal deposits are reported rediscovered about three miles from Granite Wells, twenty-five miles from Barstow. The ledge encircles a large-sized mountain and there is apparently a large amount of it. As yet it has only been uncovered about 20 feet into the side of the mountain. Such discoveries would aid the industries of the adjacent country; $14 per ton is the price of coal.

San Diego.

San Diego *Union*: R. Garvey is selling the Bay Horse mine, near Glamis, to a company of Pittsburg Standard Oil men. The sale is for $100,000, of which $10,000 was paid some months ago. It will be necessary to pipe water from the Colorado river, a distance of eighteen miles.

Escondido *Times*: A. Coventry has discovered a gold-bearing quartz vein near Fallbrook.

Santa Barbara.

Santa Barbara *Press*: Several beach oil locations have recently been made just without the city limits. A prospect well is to be driven.

Shasta.

Work has been ordered stopped on the Jackson group of copper claims in Backbone district, under bond to New York capitalists, headed by J. F. Coleman, locally represented by W. Forstner.

Redding *Free Press*: F. H. Dakin, Supt. of the Uncle Sam G. M. Co. at Kennet, reports that they have thirty men at work. Fifteen stamps have been running during March and 700 tons of ore crushed. Since March 15th they have been working new ground, the north and south ledges both being worked. The mine has its own chlorination plant. It was placed in working shape and is now being operated by W. B. Morrish.——Harrison gulch is a new camp in the southwestern part of the county. Operations are carried on by the Midas G. M. Co. in which J. H. Roberts is the principal stockholder. During the winter development work in the mines has gone on. Ten additional stamps have been placed in the mill doubling its capacity. Fifteen stamps will be kept running. Custom work will be done. The cyanide plant, destroyed by fire last year, has been rebuilt. Roasting of tailings before cyaniding will be practiced.

Mountain Miner: The report is current that the Mountain Copper Co. intends to build a refinery in connection with its smelter.

Sierra.

Dunlap & La Montanya, of San Francisco, propose to reopen the Alaska mine at Pike City. It is the intention to operate the machinery by electricity, obtaining the current from the Yuba Power Co.

Downieville *Messenger*: The hydraulic mines are in operation.——The Continental G. M. Co. has been organized with a capital stock of $30,000, to operate the Fessler mine near Alleghany.——The Kenton mine has closed down temporarily.——Four men are at work in the South Fork mine. Others will be added when timbers can be had.——The Plumbago mine is working as usual and doing repair work on the dam.

Siskiyou.

Yreka *Journal*: The mill at the Schroeder quartz mines on Deadwood mountain is running steadily.——A quartz ledge has been discovered on the Scott Valley road, between Yreka and the Forest House, which is 40 feet wide. It is on the Sells place. The ledge has been uncovered for 50 feet, and the locators will sink.——L. Knight is doing work on the Mary Ann mine on Salmon river, near Sawyer's Bar.——The Greenhorn blue gravel mine continues to pay $300 a day, besides doing dead work in crosscuts.——The Oregon G. M. & M. Co. has purchased the Ah Ock mines and ditches at Happy Camp.

Yreka *Journal*: The cleanup at the Greenhorn Blue Gravel mine Sunday amounted to $600, or double that of any previous cleanup. The average has been upwards of $300, but on Sundays all the riffles are taken up to get more gold. The mine is improving.——Jillson & Roberts are taking out ore from their mine near Hornbrook and the 12-stamp mill is running day and night. They have a 12-foot ledge.——Over 300,000 pounds of machinery will be hauled to Yreka for the Ah Ock mines near Happy Camp, Klamath river, and the old Grider, Torgenson and Fraser mines in the same section, purchased by the Oregon M. Co.——A number of copper ledges have been found near Happy Camp.——The ledge of the Golden Star mine at north fork of Humbug, tapped in the tunnel, is 5 feet wide 500 feet below the prospecting shaft on the surface. The company intends to give it a thorough test, when a mill will be erected, with concentrators.

Trinity.

The Strode Bros. are about to commence the season's operations on their mine near Trinity Center. M. Juhl will have charge of the mill.

Trinity *Journal*: The Katie Foley mine, at Carrville, is running high-grade ore in an arrastra. The owners will build a 5-stamp mill. ——A tunnel is being run on the Dewey mine which will reach the vein at a depth of 100 feet.——A cyanide plant is to be built at the Golden Jubilee mine near Carrville.

Tuolumne.

The new mill at the Bown mine near Robinson's Ferry is completed and will probably be started on the 17th inst.

Jamestown *Magnet*: The Confidence mill will start up ten stamps April 4.——A new hoist is to be built at the Arbona mine, Tuttletown.——At the Arrow mine, four miles east of Sonora, the showing is favorable. The owners will sink a shaft to cut the vein.——Machinery is being hauled to the Hazel Dell mine, seven miles north of Soulsbyville.——Miner & Burnham have struck good milling rock in their claim near Knight's creek.——Anderson, Curts & Day are taking out good rock from the old John Royal mine at Summit Pass, near Jamestown.——J. T. Newcomer is running the Dorsey mill on rock from a mine near American Camp.——The mill on the Hilton & McPherson mine, at Saw Mill Flat, is still running on custom ore from the Over and other mines.——The new pump on the Hennessy mine, at Saw Mill Flat, is rapidly unwatering the works. Sinking will be resumed.——McCormick, Bannister & Co. are shipping sulphureted ore from their Vine Springs mine to the Selby Smelting Works. Assays showed $1600 per ton of sulphurets. ——M. Page of Columbia, Supt. Gray Eagle mine at American camp, says a new shaft will shortly be commenced. The erection of a steam hoist is also contemplated.——The Old Tuolumne M. Co. has been several months reopening its 2000-foot tunnel, which was badly caved.——McKenzie & O'Hara have struck good rock in the Anaconda mine, a mile and a half north of Columbia.——D. Kelly & Bro. are prospecting in the vicinity of the old Von Tromp mine, which has been idle for some time.

Independent: The Longfellow mine at Big

Oak Flat was compelled to shut down on account of excess of water recently, but a Dow pump was put in which handles the water easily.——The Little Giant at Big Oak Flat is down 100 feet sunk with a windlass.——Rumors continue to circulate concerning the sale of the Rawhide mine on Rawhide ranch two miles northwest of Jamestown, and the App mine at Quartz mountain three miles south of the Rawhide to eastern capitalists for $1,500,000.——Wallace, Walter & Chenoweth have taken out a $600 pocket from their mine three miles northwest of Sonora.——A contract has been completed for the sinking of the Mack shaft at Big Oak Flat 100 feet and running a 150-foot drift. It is rumored that a 10-stamp mill will be put on this mine.——Supt. Page of the Grey Eagle mine near Sonora says that owing to lack of water the company have decided to substitute other power.——Mining men from Placer county visited the Siner mine, northeast of Columbia near the Ham and Birney, with a view of purchasing. A shoot of ore has been opened up. The vein is 4 inches to 3 feet in width and is said to mill $12 per ton.——Samuel Ralston uncovered in his pocket mine east of Sonora gold to the value of $5000.

Union-Democrat: At the Alameda, four miles west of Sonora, an east crosscut is being run at the 900 level, where it is reported a 13-foot body of ore has been found.——B. McDonnell has resigned the superintendency of the Big Betsy and will go to Mexico to take charge of a property H. McDonnell recently sold to a London syndicate.——The Boston & Tuolumne Co. has put in at its mine at Big Oak Flat a 6-inch jackhead pump, which drains the workings down to the 200 level. Sinking is in progress. W. R. Dorr is Supt.——The shaft of the Mack mine at Big Oak Flat is to be straightened and a contract let to sink 400 feet.——It is reported that O'Brien & Landers of Sonora have sold the Green and Mt. Moriah mines on the East Belt, near Sugar Pine, to Wells & Richardson, an Eastern company. The price was $31,500 cash. These mines were among the first bullion producers of Tuolumne county, but have long been idle.

COLORADO.

BOULDER COUNTY.

The Dolly Varden mine is reported sold to Eastern people for $125,000.

CHAFFEE COUNTY.

Denver *Post*: Covey & Kennedy report they have free gold on the Mollie Gibson in the Whitehorn district, sixteen miles west of Salida. At a depth of 13 feet the vein is 24 inches wide, estimated to run about $160 a ton. The district is little known and embraces 75,000 acres of land. Twenty properties are shipping pay ore.

CLEAR CREEK COUNTY.

Mining Gazette: The owners of the Big Six mine on Cnicago creek have 8 inches of ore that runs from twelve to sixteen ounces gold per ton, and 1 foot that runs well on the plates.——The B. B. tunnel has 12 feet of ore that nets $12 per ton. Several veins have been cut and drifting and stoping commenced.——The Century tunnel on Chicago creek has cut four veins, some of which show good values. A large vein has been found which lies with the tunnel.——Three sets of leasers on the Quito are taking out good ore.——Forester & Sons, on the extension of the Quito, on Chicago creek, have been shipping ore for three months to the Mattie mill.——Denver parties have taken J. Morris' property on Chicago creek and will work the Home Guard.

EL PASO COUNTY.

Victor *Record*: A pump with a capacity of 1000 gallons per minute has been put in below the 8th level of the Portland mine at Cripple Creek.——Recent development on the Hoosier shows that Lessee Anstie has two parallel veins, both carrying high values. The drift has been extended 30 feet on the west vein, 4 feet in width; assays on 33 inches went three ounces to the ton and the remaining 15 inches sixty-one ounces. The easterly vein is 7 feet wide and is good pay.——Misson and associates on the M. K. and T. of the Columbia-Victor Co., are getting out ore from a small streak in the 200 level. The ore runs ten ounces to the ton.

Denver *Mining Record*: The Damon at Cripple Creek has struck a new ore body. A chance shot into the west wall of the level at 75 feet has disclosed a new ore shoot, probably the apex of a new vein. It has been opened from 5 to 7 feet in width for 20 feet.——The Osborn lease on the Favorite shows free gold visible to the eye. An assay from the breast showed $300 to the ton.——Pinnacle lessees at Cripple Creek are getting ready to ship twenty-five tons of ore from the Lansing lease. Lessees are doing development.

Woodland Park *Times*: It is now reported that H. B. Kenyon will build a 100-stamp mill on the land of Dr. Bell, near the mouth of Missouri gulch, for the purpose of working ores of the Sandstone belt. Five claims have been bought for $10,000 cash by the people backing the enterprise.

HINSDALE COUNTY.

Denver *Record*: The new compressor and drill at the Contention mine are in operation, 7 feet will now be made daily until the Argus tunnel reaches the Contention vein. The Megunticook Co., operating the Contention, have a large body of ore and they will probably build a mill.

LAKE COUNTY.

The Small Hopes M. Co., lessees and operators of the combination of deep sulphide mines, worked through the three-compartment 1330-foot R. A. M. shaft, have reduced shipments, laying off a large force of men. They will commence sinking the shaft below the bodies of ore under the present deepest level. The second and third levels will be worked. A small hoist will also be used at the bottom level. These ore bodies are the deepest in Leadville.

Leadville *Miner*: The Bon Air shaft, which caved recently, has been caught up for about 100 feet and the work is progressing.——The Iron-Silver mine on Iron Hill is shipping 300 tons of iron sulphides daily. There are 115 men on the payroll.

Leadville *Reporter*: The Greenback shaft has reached a depth of 1060 feet and is in lime. The new hoist is in position. The gallows frame posts will be of Oregon fir, 12x14, 65 feet long. The shaft will be sunk to 1500 feet. At 1100 feet a station will be cut and a drift run to strike the ore bodies in the Mahala.

RIO GRANDE COUNTY.

San Juan *Prospector*: Good reports come from the Income mine at Embargo. A body of ore, which is understood to average from $75 to $100 per ton, has been found.

SAN JUAN COUNTY.

The Yukon Tunnel mill is spoken of as one of the possibilities. It will be placed on the Uncle Sam group, up Cement creek. This property is owned and operated by the Boston & Silverton M. & M. Co.

The Cliff Dweller tunnel is now in 300 feet, with 70 feet farther to drive to cut the ore shoot.

A 4-foot vein of fine gold quartz was tapped 275 feet in the crosscut on 1. X. L. property, owned by the American M. Co., above Gladstone.

SAN MIGUEL COUNTY.

San Miguel *Examiner*: Work is under way again on the Keystone placer. A number of placers along the San Miguel river will be worked this season.——The forces at the Silver Peak are being increased each week and it will be but a short time until the mill will start.——Work on the Enterprise dumps at Rico will soon begin, Mr. Hawley having an eastern company to assist in his enterprise. A concentrating plant will be built.——It is rumored that the Iron mine will be worked this season. During '98 the mine shipped 258 cars of iron ore to Durango. It is low grade, averaging about $5 per ton. The deposit is of unknown extent, but is easily handled and close to the shipping station. Work stopped when the snow came.

IDAHO.

The Florida Mountain M. Co. and the Trade Dollar M. & M. Co., on Florida mountain, Owyhee county, have been consolidated. This combination takes in all the important mines on Florida mountain except the Black Jack. The Florida Mountain Co. will receive $1,500,000. This company has expended $340,000 in mill and other improvements. The mines will be worked through a tunnel, the mouth of which is at Dewey. When the Blaine mine is reached—the objective point—the tunnel will be 13,700 feet.

Graham, Garrett & Co., of Spokane, Wash., have organized the Syndicate G. M. Co., which is developing a gold property in the Buffalo belt, forty miles northwest of Buffalo Hump. It is claimed they have uncovered a ledge of gold-bearing quartz from 8 to 10 feet wide, the values running high. Seventy-five men are said to be at work in that vicinity.

The construction of the 200-ton concentrator at the Hecla mine at Wallace is in progress. The mine has been developed so that a supply of ore is available. There are several claims in the group.

The Banner M. Co. has let a contract to continue its lower crosscut tunnel. It will be over 600 feet long when completed, being half way in now.

At Midas Bar, Snake river, a trial run of a dredge is being made under the direction of a company of Douglas, Wyo. The run is to be made on ground leased from E. S. McComas; the contract requires that the dredger is to work 2000 cubic yards of dirt per day for fifteen days, and save 85% of the values. In case of failure the builders of the dredge are to forfeit $3000.

Salt Lake *Tribune*: The 500-foot tunnel on the Blue Jacket mine in Seven Devils has cut the ledge at 310 feet from the surface and is 45 feet between defined walls. The ore is of good grade.

Cuprum *Standard*: The United Copper Mine Co. will soon begin the erection of a smelter at the Greenvale mine, having 100 tons capacity. It will be run also as a custom smelter. On one of the claims of the company half a mile from Cuprum a 6-foot vein of pyrites has been discovered. A diamond drill is to be used in prospecting in the vicinity.

Spokane *Chronicle*: The Wall Street group at Buffalo Hump has been bonded to D. B. Wilson and L. H. Eddy of Salt Lake City for $50,000. The first payment of 10% is to be made May 5th. The group consists of the Wall Street, Banker and Broker. A 6-foot ledge has been opened running the length of the claim. Assays from the surface have run $32.

Mullan *Mirror*: Work on the lower tunnel at the Bell mine at Mullan is progressing with two shifts of five men each, 1200 feet will be driven. A wagon road is to be built to the mine starting from the Gem mill.—— The drift at the "16 to 1" is in 3 feet of clean ore. An assay of ore shows 66% lead and forty-five ounces of silver.——Ground has been broken for the Hecla mill at Burke. The mill will be running June 1st.——At the Sonora, above Burke, 650 feet of tunnel has been driven to reach a ledge 200 feet farther in.——Five men are driving a tunnel at the Union, opposite the Granite mill on Canyon creek, on what is thought to be a continuation of the Gem.

Spokesman-Review: The Standard M. Co. of Wallace, Idaho, paid a $30,000 dividend April 1st, making a total of $1,745,000.——The Big Buffalo shaft at Buffalo is down 35 feet, but for the last few feet values have depreciated, and the size of the shaft will be reduced; the force of miners will be not more than twelve men. It is said the ore in the bottom of the shaft is more heavily mineralized than above, and carries enough gold to pay if the values now shown hold out. Definite information as to values could not be obtained.

Sheridan Paper: The Winslow claim, in the Buffalo Hump camp, is reported bonded to D. B. Huntley, representing the the De Lamar Mines, Ltd., of De Lamar. The consideration is $50,000, of which 10% has been paid.——W. H. Wright of Spokane has bonded the San Francisco group at Buffalo, comprising the San Francisco, Baby Louise and Monte Carlo claims, for $50,000, and $1000 has been paid.

MICHIGAN.

The American Steel & Wire Co. have purchased five lake steamers of the Zenith Transportation Co. of Cleveland for about $1,000,000 to be used in carrying ore from the Superior mines recently purchased by that company to Chicago and other ports where its mills are located. The company acquired a few vessels with some of the constituent companies in the reorganized concern, and will probably add a few more to its fleet. It will probably establish also a line of cars to handle ore between lake ports and some of its interior mills.

At the Franklin mine the cost of stamping was reduced from 54 cents per ton in '97 to 51.02 in '98, and the cost of handling rock per ton from $1.82 in '97 to $1.60 in '98.

MISSOURI.

The Missouri Zinc Fields Co., the Boston-Providence, and the Boston-Duenweg, made a Missouri output of 1,034,000 pounds of zinc and 20,000 pounds of lead for the week ending April 2nd. The total output of the district was 12,630,880 pounds of zinc and 908,370 pounds of lead, which sold for $258,286. The district is now producing at the rate of $15,000,000 per annum.

MONTANA.

The Anaconda C. M. Co. of Butte has let a contract for the construction of a five-mile tailings flume to carry tailings away from the Anaconda smelters.

The mines and smelters of the Boston & Montana Co. are all closed down and hundreds of men out of employment pending an adjustment of the legal difficulties of the concern. This state of affairs is the outcome of litigation between the Boston & Montana and the Montana Ore Purchasing Co. Suits for unlawful extraction of ore are pending, involving about $5,000,000. The properties of the two companies are worth, according to market quotations, nearly $70,000,000.

Denver *Mining Record*: The Sailor's Dream, in the porphyry belt fifteen miles north of Butte, ten years ago produced $60,000 from surface workings, but, with development, it has widened into a body of low-grade ore running from $10 to $14 per ton. The property has been purchased by a Butte syndicate, who have erected a mill which is saving $10 per ton on the plates. This is the only property in this unorganized district that has any development.

Whitehall *Zephyr*: The Anaconda Co.'s coal mines at Belt are closed and the miners have left camp. They struck for higher wages and the shut-down resulted. No employe is retained, except the watchman.

Helena *Independent*: Negotiations are pending for reopening the Whitlatch-Union mine, the property of the National M. & Exp. Co., at the head of Oro Fino gulch, four miles south of Helena. The deposit of free-milling ore in the original McIntyre and Union lodes was discovered in '64. In '66 J. Whitlatch became the owner of one of the claims, which extended 200 feet along the vein. Miners' wages were at first $6, then $5, and in '72 fell to $4 per day. Judge Turnley owned a 10-stamp mill on Grizzly gulch, in which Whitlatch treated the first 1000 tons of ore, paying $15, the cost of hauling being $5 per ton. To-day this ore could be treated in a 10-stamp mill on the ground for $1.50 a ton.

Helena *Independent*: An 84 H. P. gasoline engine has been taken to the East Pacific near Helena to operate an air compressor and machine drills.——A strike on the Fourth of July lode at the depth of 300 feet is reported. It lies north of the New Year mine in the Judith range. —— The Old Joe mine, near Pony, has been steadily worked the past winter by Drackert & Ervin, who have a lease and bond on it, and are driving the lower tunnel where they have a body of ore that will run from $10 to $30 per ton.——The shaft on the McClellan mine, Dry gulch, is down 160 feet; the ore is not so hard and another crosscut will be run at 200. At the 100-foot level is an ore body 90 feet wide which can be worked by concentration at profit. H. Bush, Mgr. of the mine is now in Helena with a view of the construction of a concentrator. —— The new 10-stamp mill on Big Indian gulch east of Dry gulch is operating successfully as is also the Winscott mill.——Progress is being made on French bar twelve miles northeast of Helena, on the dredging plant and in the erection of the 10-stamp mill.—— Another dredging plant is east of East Helena. The machinery has been moved to the ground and the manager expects to start by May 1st. ——The cutting of a station on the 400-level in the main shaft of the Eva May mine has been completed and the sinking of the shaft to the 500 level will be commenced. The mine is at the head of Cataract creek, south of Rimini, and is equipped with a hoisting plant and a 200-ton concentrator.

NEVADA.

On the Comstock, Mgr. Ross of the Comstock Pumping Association keeps the elevator at work in the C. & C. shaft. Last week he reported as follows: "The Pumping Association has been engaged in cleaning out and repairing the C. & C. shaft below the 1750-foot level. The shaft is in fair condition. The pump compartment is nearly full of air pipes, columns, straps, pump rods and bobs, that are difficult to take out. This compartment must be cleaned out, as the space is required for the second elevator that will be placed in this compartment before the water can be lowered by the first arranged elevator. The plan is to place the second elevator in the pump compartment at as great a depth as possible: then to start it and hold the water at a point that will allow us to break the joints in the elevator that is now at work and raise it to the surface of the water, when such changes as are required can be made in the throat and nozzle, then to lower it into the water again and submerge it as deep as possible.

"When the water has been lowered the pump compartment will be cleaned out to as great a depth as possible and the elevator in this compartment will be again lowered to the point where the required changes can be made in the first elevator. In this way of working the 500 feet of flooded levels will be drained. Judging from our experience in draining the shaft for 150 feet below the Sutro drain boxes, it has been found that if an elevator was designed for the full lift of 500 feet, and it could be submerged below that point, it would drain the C. and C. shaft for that distance in from three to four weeks; but it would not be safe to attempt such work. The water is being drained from the lower levels slowly, while being rapidly lowered in the C. and C. shaft, as our measurements taken at the Con. Cal. & Va. winze, the Hale & Norcross incline and the Chollar combination shaft indicate.

"It is quite possible that nearly all of the drainage from the various mines finds its way through the vein and not through the drifts, as our experience with Comstock drifts and levels indicates very clearly that there are but few places where these openings will not cave tight enough to form fairly strong dams.

"Since April 1 the water has gone down in the Chollar combination shaft 5 feet 1 inch, in the Hale & Norcross incline 12 feet 6 inches, and in the 1750 winze 16 feet 9 inches, while being lowered 120 feet in the C. & C. shaft. No measurements were possible in the Obiston shaft until April 6, when we found the water to be 52 feet 11 inches below the station of the drift connecting with the Sutro tunnel. The water in the C. & C. shaft is being kept down to about its lowest mark, 132 feet below the 1750 level, by running the elevator sixteen hours during each twenty-four. We expect to continue working in this way until the second elevator is in place. The Pumping Association has been engaged as usual in doing work for the several mining companies, as appears in their weekly reports."

On the 12th he wired: "Elevator working steadily. Water in 1750-foot level winze 19 feet 7 inches below the station."

On the 13th Mgr. Ross sent the following: "Elevator working steadily. Water in the 1750 winze is 20 feet below the station."

There is no truth in the rumor that the big mill at DeLamar is to be closed down.

High-grade copper ore containing silver has been developed in Glencoe district, White Pine county, near the Utah line.

J. Purstcher is reported to have sold his interest in the Magnolia mine at DeLamar, Lincoln county, for $11,000.

Haggin & Tevis are said to be negotiating for Pioche mining property. The Raymond & Ely is one of them, for which the same firm offered $2,000,000 about twenty-five years ago.

The Searchlight district is just across the California line, near Manvel, and has a population of 100. The erection of a 20-stamp mill is talked of for F. W. Dunn, on the Colorado river, ten miles away. Turquoise is shipped from the Simmons mine to New York.

G. J. Smith has sold for $10,000 the Eria mine at Tuscarora to Woodruff & Redman at Salt Lake City, who also took an option on the ore on the dump at the mine for two years at $5000. Mr. Smith took out $180,000 and left a body of ore in sight below the water line. The new owners will put in a pumping plant and a 10-stamp mill.

Virginia *Chronicle*: Supt. W. E. Sharon, being asked as to the probability of work being resumed in the Gold Hill mines under his management, replied that the successful drainage of the Con. California & Virginia levels will be followed by the installation of a similar plant to drain the Gold Hill group.

Carson *Appeal*: J. Watson has struck a ledge of rich gold ore at Morrison Hill, back of South Camp. A number of parties have left Gardnerville for the scene and it is expected that a rush will follow.

Silver State: Repairs to the Obiston shaft have begun. Men are framing timber sets to replace those caved from the surface and the construction of hoisting works will begin at once.——A few men are at work on surface repairs at the Yellow Jacket old shaft in Gold Hill. Preparations for draining Gold Hill mines will soon begin.——The March pay-rolls of the Kinkead M. & M. Co. reached $3000 and those for April will exceed that amount. Twenty men are employed in taking ore from the Gould & Curry fillings.

Virginia *Enterprise*: It is reported that a rich strike has been made in the Enterprise (old Keyes) location in Seven-mile canyon.

Salt Lake *Tribune*: The New Pass M. Co., whose office is in Salt Lake, Utah, contemplates building a mill with fifteen stamps. For some time the management has been putting the ores through a small mill. A sampling of the mine shows an average of $25 per ton in gold.

NEW MEXICO.

Silver City *Enterprise*: The Texas mine at Central is showing up a body of ore on the 500 level. The mill is running. The new wells sunk to supply the mill developed abundance of water.——The Grand Central mine, owned by the same company, is being developed by a drift at the 300 level with satisfactory results.——Stevenson & Cochrane have taken leases and bonds upon several mines and are building a 5-stamp mill, with concentrators. They will soon add a crusher and a set of high-speed rolls.

OREGON.

C. H. Thompson of Spokane, and A. MacQueen of Butte, Montana, have bonded the Bunker Hill group, near Baker City, for $20,000.

Sumpter *News*: Godfrey & Taber of the Red Boy came down from the mine recently with their regular monthly clean-up of about

$20,000.——F. S. Lack of Baker City is Supt. Magnolia mine, near Granite. The force of ten men will be increased.

Baker City *Epigram*: McComas & Dumphy of La Grande have purchased the Keystone and Belle mining claims, adjoining the Bonanza, from H. P. Watson. The 200-foot tunnel is to be extended and other developments made.

SOUTH DAKOTA.

Black Hills *Mining Review*: In the Detroit & Deadwood tunnel, on City creek, steel rails are being laid as fast as the excavation is made.——The Dacy shaft at Ragged Top is down 500 feet in limestone.——The shaft at the head of Spruce gulch, near Deadwood, being put down by the employes of the Golden Reward Co., is 300 feet deep.——Quartzite has been struck in the Faust & May shaft at Garden City. The mine had been in a formation which was called the lower quartzite. J. B. Le Beau of Central City sunk a shaft through this hard rock and found a true quartzite lower down.——The new concentrating plant at the Bismarck mine, Keystone belt, will start up the 10th inst. All machinery has arrived. The process is new to the Black Hills, and it is being watched with interest.——Shipments have been resumed from the Esmeralda, in Blacktail gulch, owned by E. Faust. Several weeks ago a shoot of ore was found, but a cave occurred just as shipments commenced. The ore body is uncovered for 40 feet and has a height of 9 feet, carrying an average of $45 gold per ton.

Deadwood *Independent*: Corkhill & Fish have started a shaft at Gayville, in Deadwood gulch, to work a remnant of placer ground left by the early miners of '76-'77.

UTAH.

The stockholders of the Phœnix M. Co. have ratified the deal by which Kooser, McIntosh, Klenke and Shepardson become the purchasers of that Bingham property for $125,000.

At Salt Lake, on April 4th, the United States M. Co., with a capital stock of $10,000,000, was incorporated. The directors are E. K. Milliken, H. P. Sweetser, A. F. Belcher and L. L. Hight of Portland, Me. The company has acquired the property of the Jordan & Galena, Old Telegraph and Niagara of Bingham.

The Daly-West mill at Park City is again in operation and the mine force has been increased.

Almost every mountain range and hill in Utah contains a mine. There is not a county that does not have mines of good promise and some are already great.

A discovery of rich copper ore in a new district in southern Utah is announced, but the discoverers refuse as yet to make public the locality.

Tintic *Miner*: From the Ajax at Tintic a 200-ton shipment is being made, one-half of which is copper ore which samples 40%, 15% lead, fifteen ounces silver and from $8 to $4 in gold to the ton. The other half is "dry ore," estimated at $50 per ton in gold and silver.

Salt Lake *Tribune*: Fifteen men are now employed prospecting for new ore bodies in the Eureka Hill mine at Eureka.——Reports are in circulation that the Bullion-Beck concentrator is to be started again. Repairing is now being done at the plant.——The new management of the Old Telegraph, Niagara, etc., will begin operations at once by installing two large air-compressing plants and will develop the mines. It may take a year to do the development work contemplated and it is probable no ore will be shipped during that period. No leases will be given. Should development warrant it a smelting plant will be put in either at the mines or on the Jordan river or at both places to handle copper ores, lead ores or both.——At the Bingham C. & G. M. Co.'s property, Mgr. Heffron has put in a pump with which the unwatering of the main incline has been accomplished and the blocking out of ore is far advanced.——O. P. Landon has been developing a group of claims in Buckskin mountains with good results. Among the assay certificates is one that shows $2800 per ton in gold. He reports the discovery of a vein of elaterite in Garfield county in which a good showing has already been developed and will begin shipment as soon as a market is to be had for it in the East.

Mercur *Mercury*: All the vacant ground between the South Snowstorm and the Sindar group at Mercur has been located during the past week.

Salt Lake *Tribune*: The Camp Floyd mills are grinding over 1600 tons of ore daily, and when enlargements promised are completed the output will increase to over 2000 tons daily.——It is rumored the Ontario and Marsac mills at Park City will be running full capacity by May 15.——The Silver King mill is expected to start up within a week.——Mgr. Daly of the Daly-West is at Park City perfecting arrangements to increase the output.——The mines at Copper mountain, Box Elder county, are reported sold to Lewisohn Bros. It is the intention of the purchasers to perfect the plant and to operate on an extensive scale. The mines and smelter will give employment to 200 men.

Tintic *Miner*: At the Mammoth mine at Mammoth Hollow, the main shaft is down 1800 feet. The 60-stamp mill is kept running night and day by Supt. O'Rourke, who has been making tests of a new vanner, with which the mill may be equipped. In the mine are several bodies of ore difficult to treat and the board is discussing a cyanide plant. This ore under the cyanide tests yields about 15 ounces silver and .34 ounces gold to the ton.

Salt Lake *Tribune*: The Mercur Co. at Mercur will refine the auro-cyanides at the works hereafter and the Golden Gate Co. is preparing to do likewise.——In the recent strike in the May Day on Godiva hill the crosscut reveals a deposit of the same general character as the Uncle Sam and Godiva adjoining, a large part of which is lead ore carrying silver. There is also black quartz, which, besides silver, assays $14 in gold. The May Day strike has awakened interest in the Yankee Consolidated tunnel, which adjoins it on the south and east, and it is reported that the face of the tunnel has the same appearance as the May Day when the latter was nearing the ore.——Two loads of elaterite have arrived at Price from the Raven Co.'s mine in Indian canyon, and there are thirty tons more on the road.

Eureka *Republican*: The old Cave mine, comprising thirteen claims, is again operating, with S. T. Godbe as Mgr. They have a 1900-foot tunnel and are working virgin ground.——At the Horn Silver, Frisco, copper ore is being mined on the 1600 level. Originally the Horn Silver was a lead-silver mine.

Salt Lake *Tribune*: The Bullion-Beck at Eureka at a depth of 1300 feet has tapped a stream of water that will meet the requirements of its hoisting plant, if not to supply the concentrator. The strike is looked upon as of as much importance as a stream of silver and lead. The flow is about 800 gallons a day. A force of men are repairing the mill which will be started up on Saturday.

WASHINGTON.

The Golden Chariot and Golden Chest, at Republic, are being developed extensively. The veins are large.

A tunnel has been driven 200 feet on the Saly Ann, on Toroda creek.

It is reported that a strike has been made in the Charleton, near Horse Springs.

J. C. Clarke has taken a force of men to Pierre lake to resume work on the Helen E. and Mother Lode claims.

The Alice-Eureka has a body of ore in the face of the drift in which free gold is visible.

A. & E. Uhler, who located the Copper Queen and King, in Nespilum camp, sent 100 pounds of the ore to the Everett smelter, which returned $41 gold and 5% copper. This camp is thirty miles north from Wild Goose Bill's ferry.

Large low-grade veins are being developed on Iron mountain, six miles southeast of Republic. On the Big Three claim the vein has been stripped in a series of pits for 800 feet; it is 20 feet wide.

Republic *Pioneer*: A blind lead has been cut in the Alice-Eureka at Republic in the tunnel that did not show on the surface. It is 5 feet wide and assays $12. The tunnel is running for the main vein and has 35 feet to go.——G. Miller has been appointed Supt. of the Ben Hur at Republic. Preparation for sinking the double-compartment shaft is in progress.——Gold is reported discovered east of San Poil lake—a new locality. The discoverers thus far refuse to name the exact locality.

WYOMING.

Grand Encampment *Herald*: It is reported that sylvanite has been discovered eight miles east of Grand Encampment, associated with phonolite.

FOREIGN.

AUSTRALIA.

Mining Standard: The newly erected battery on the Sebastopol Plateau No. 1 Co.'s claim, Victoria, consists of thirty stamps of 1000 pounds each, falling ninety times per minute, with 6-inch drop, capable of treating 400 tons of quartz per week. The stamps are fitted with disengaging clutch gear, and the ore treated comprises crushing, amalgamation, concentration and chlorination. There is provision for water supply in a dam with a capacity of 600,000 gallons and the water is raised by a plunger pump driven by the main engine. The motive power for the battery is supplied by a 22-inch by 48-inch horizontal engine.——No material change in mines at Kalgoorlie is reported up to Jan. 1st.

Mining Standard: The Broken Hill mines in New South Wales produce over 1,000,000 tons ore annually which contains a large percentage of zinc. In these the value of the zinc is from $30 to $35 per ton, and the value of the lead only $15, yet it pays better to extract the lead than the zinc. The zinc contents of these ores at present are worth more than all the other metals they contain yet it cannot be separated at a profit. There are millions of tons of ore in the dumps and tailings piles of the Broken Hill mines.——Copper finds are reported from northern Queensland.——According to official returns New Caledonia last year exported 75,000 tons of nickel ore, 2373 tons of cobalt ore, and 7711 tons of chrome ore.——Owing to increased value of lead and tin, abandoned mines in New South Wales are receiving attention. A discovery of tin has been made at Mundi Mundi station, and valuable specimens have been brought in.——It is reported that the third prospecting shaft sunk by the N. S. W. Government in the Araluen valley is down 48 feet with 8 feet of washdirt. There is a large area of unworked ground, but it is very wet.——The English-owned Beacon mine, in the Coramba district (N. S. W.), is employing fifty hands in development.

BRITISH COLUMBIA.

(Special Correspondence).—When I came to Rossland I found three big shipping mines and several smaller ditto and the usual "shriekers" on the outside, a good, substantial camp, good houses and good people, bent upon building up the country and putting in their money to back it. I liked this and stopped there for several months. Some months later I came over here to look after some mines, and here I am still. There is much interest being manifested in this whole section, and the eastern Canadian cities have money to buy with and are buying, particularly in this locality. There are others just as good, but this has the present call. This camp is characterized by enormous "zones," I call them, of copper and gold bearing material, hundreds of feet in width. In these widths you cannot pick up a piece of rock not more or less impregnated with metallic sulphides. These sulphides consist of chalcopyrite, pyrrhotite and marcasite; the gold values seemingly follow this last. The enclosing rock is an altered basic eruptive. There are occasional masses of solid chalcopyrite occurring in these great zones of mineral, also masses of the iron sulphides carrying good gold values. Developments have not been extensive, but work is going on now on a number of these as rapidly as money can push it. I need not say that it takes big concerns to operate such properties, which will require concentrators, smelters and railways. Of course, the small chippy operator is here also in force bonding Gatos Bronco and examining snow croppings. The prospectors think him a fool, but the poor devils who buy upon his representation will have other and compound names for him. What a pity for legitimate mining that these fellows cannot be thrown into a pit to feed upon each other! Here are these honest Canadians who have by industry accumulated wealth; they earnestly desire to build up their western empire. They are willing to pay, and are they not entitled to fair treatment for their pluck and intent! There never yet was an honest desire to build up the cleanest of all industries in any section that rogues did not get in and cover it with infamy. To hark back to ancient history: Tubal Cain was probably an honest assayer, Solomon possibly may have had good mining judgment, but I will bet that Judas Iscariot was a mining promoter—I mean a promoter of wildcats, of course.

Besides these big base zones of which I have spoken, there is a granite range a little to the north where there are some free gold ledges. In fact, there are all things in this section—in the Slocan fine small veins of very high-grade, silver-bearing galena; in the Fort Steele country the same. There are dozens of little camps all over the country. Wherever there is one you can rely upon it that there is something—maybe not much, but something. These little camps all mean business for Canada and for the Canadian Pacific, and the Canadian Pacific does all it can to help them, mark you that! Did you ever hear of a big railway building a smelter to help a lot of poor miners to a market for their ore? Well, the C. P. R. R. did at Trail, and has not robbed them on treatment either.

Greenwood, B. C., March 31st, '99.

The sale of the Enterprise, a Slocan silver-lead property, is reported to the London & British Columbia Gold Fields, Ltd., of London for $750,000. It was owned by Finch & Campbell of Portland, Or., and D. M. Hyman of Colorado.

The Payne mine, consisting of five claims, has an area of forty acres and a length on the line of the vein of about 2500 feet. It was the first claim located in the Slocan. The average altitude of the property is about 6500 feet. It is connected with two railways—the Kaslo & Slocan and Nakusp & Slocan (C. P. R.)—by means of a self-acting tramway, which is said to be the longest in the world of its kind—6000 feet—with an elevation of 2500 feet. The ore chute on the Payne is 1240 feet in length, and is, so far, the longest discovered in British Columbia. The property has been mined to a depth of about 300 feet, and is now being developed by two other tunnels. The shipments in '98 averaged 105 ounces silver and 53% lead; gross value, $97.79 per ton, or, after deducting freight, treatment and duty, $62.39. The rate paid last year for freight and shipment was $21 per ton; this has recently been reduced to $19. The cost of exploratory development work during the first two months of '99 amounted to $3.18 per ton of ore milled. The capital of the new company, the Payne Con. M. Co., Ltd., will be $3,000,000, in $1 shares.

The Hall Mines smelter at Nelson is expected to begin this week the treatment of silver-lead ores. It is not the intention of the company to attempt the treatment of silver-lead ores by themselves. Silver King ores carrying a small percentage of copper will be treated with the galena ores.

The Gem and the Story claims, north of the Sullivan group, have been sold to a Spokane syndicate, composed of W. W. D. Turner, W. M. Ridpath, W. J. Harris, C. Thies, W. J. C. Wakefield and G. Foster. Work is to commence as soon as snow disappears. This is the fourteenth property sold or bonded in Fort Steele district within thirty days.

A deputation from Nelson has waited on Minister of Mines Hume, asking a revocation of the eight-hour amendment to the mining act passed last session. They represented that it caused a closing of many of the principal mines and upset a $300,000 deal. The deputation believe the Government will grant their request.

The total shipments of ore from Rossland to the several smelters from Jan. 1st to April 8th was 22,036 tons.

Trout Lake *Topic*: The Nettie L. mine on Trout Lake has commenced shipping ore. The Beatrice is also sacking ore for shipment.

Ymir *Miner*: The Dundee Co. has sent forty-two tons of concentrates to the Northport smelter.——Work on the Spotted Horse, on Round mountain, is to be started up at once.——A four-drill compressor has been ordered for the Yellowstone and preparations made for an increase in the force.

LOWER CALIFORNIA.

San Diego *Union*: A stamp mill and dynamo have been shipped to H. M. Russell at Alamo for his mine in that district.

MEXICO.

(Special Correspondence).—D. H. Snyder is working the Santiago mine and has 600 feet of work done in the way of shafts, tunnels and levels. His ore assays from $5 to $300 per ton.

R. L. Penn is working the Colorado mine which assays from $30 to $480 per ton. These two mines are ninety miles from Agiabampo and fifty miles north from Feurte.

Mitchell & Swenigston are working a mine between the two above mentioned.

W. Head of Cripple Creek, Colo., is working a promising copper mine 15 leagues southwest.

Bradley & Shauklin of Kansas City, Mo., are working a placer claim with good results. They have two 30 H. P. boilers and an 8-inch centrifugal pump. M. Erbe is putting in a stamp mill near here, the first in the country. There are several other parties getting started.

Santiago Mine, Sinaloa, March 29th, '99.

A Durango dispatch says that the Sierra de Mercedo mountain of iron adjoining that city has been purchased by C. P. Huntington for $800,000 in gold. The Sierra de Marcedo is a mass of magnetic iron ore 2500x5500 feet and 2000 feet high. Mr. Huntington is locally credited with intention to establish steel works there. The Mexican International Railway, owned by Huntington and associates, is built to the foot of the mountain.

The Avino mine, in Avino Camp, Durango, has been worked for 300 years by the Mexicans. It was bought for $300,000 and has lately been financed for $4,000,000 by Boston, New York and London men. The syndicate which purchased it is known as the Avino Syndicate, Ltd. In making a crosscut to connect two different workings, a vein of sulphide copper was cut through, averaging 10 feet in width. In this ore, which is now being taken out, there runs about twenty-five ounces silver and from $2 to $3 in gold per ton. The products of the mine include lead, copper, gold, silver and iron, for all of which the owners are getting pay at the smelter, the iron bringing 25 cents per unit; a 300-ton smelter is now being put in.

The miners exploring the coal beds at La Barranca in Sonora, under the direction of Prof. Dumble, it is reported, have found at one place a bed of natural coke 7 feet thick.

Modern Mexico: Smelter No. 3 at Monterey has the tallest smokestack in the Republic, 183 feet from the ground.——G. Watson, of Chihuahua, is erecting a smelter at Inde, Durango, for the reduction of lead and silver ores.——Over 500 tons of ore are exported daily through the custom house at Juarez, and a large amount treated there.——During February the Sierra Mojada mines produced $416,770.70 in silver, copper and lead, from 15,605 tons of ore.——An experimental plant is being erected at La Colorada, Sonora, for treating tailings and ores by the cyanide process of Charles Butters & Co.——The Penoles Co. of Durango paid dividends amounting to $1,050,000 last year; the Santa Maria de la Paz, Matehuala, $960,000; and the Esperanza y Anexas, $420,000.——Fifty men are now employed on the Dos Cabezas, sixty miles from Casas Grandes, and this number will be increased to 150. The company has $200,000 worth of low-grade ore mined, ready for shipment. E. S. Stephens represents the owners.——Lewis Bros., of New York, are opening antimony mines twenty miles northwest of Santa Ana, Sonora. They have already extracted about 100 tons of ore, which will go to New York. A. Hoover represents the owners.——J. Fraser has purchased two rich mines situated eight miles west of Sombrerete, for $15,000.

NEW ZEALAND.

Cromwell *Argus*: The Hartley and Riley beach deposit near Cromwell is being successfully dredged by a belt and bucket dredge. Considerable fine gold is coming up, though bedrock has not been reached.

Mines Record: The Excelsior mine on Old Man Range is working steadily, and is equipped with a 3-stamp mill run by a Pelton wheel. Owing to the high altitude (some 3000 feet above sea level) this mine can only be worked eight or nine months in the year.

The iron sands of New Zealand are mixed with clay and formed into bricks, in which condition they are smelted after drying. The mixture consists of 160 parts iron sand, 25 parts blue clay and 25 parts yellow clay.

PHILIPPINE ISLANDS.

Gold is found in a number of localities in the archipelago, from northern Luzon to central Mindanao. In most cases the gold is detrital, and found either in existing water courses or in stream deposits now deserted by the current. These last are called "alluviones" by the Spaniards. It is said that in Mindanao some of the gravels are in an elevated position and adapted to hydraulic mining. There are no data at hand which intimate decisively the value of any of the placers. They are washed by natives largely with cocoanut shells for pans, though the batea is also in use.

In the province of Abra, at the northern end of Luzon, there are placers, and the gravel of the river Abra is auriferous. In Lapanto there are gold quartz veins as well as gravels. Gold is obtained in this province close to the copper mines. In Benguet the gravels of the river Agno carry gold. There is also gold in the province of Bontoc and in Neuva Ejica. The most important of the auriferous provinces is Camarines Norte. Here the townships of Mambulao, Paracale and Labo are especially well known as gold-producing localities. Mr. Drasche, a well-known German geologist, says that there were 700 natives at work on the rich quartz veins of this place at the time of his visit about twenty-five years since. At Paracale there are parallel quartz veins in granite, one of which is 20 feet in width and contains a shoot in which the ore is said to assay thirty-five ounces of gold per ton. One may suspect that this assay hardly represented an average sample. Besides the localities mentioned, many others of this province have been worked by the natives. The islands of Mindoro, Catanduanes, Sinuyan, Panay, Zebu and Bohol are reported to contain gold, but no exact data are available. At the south end of the small island of Panaon, which is just to the south of Leyte, there are gold quartz veins, one of which has been worked to some extent. It is 6 feet in thickness and has yielded from $6 to $7 per ton. In the island of Mindanao there are two known gold-bearing districts, the province of Surigao, where Placer and other townships show gravels and veins, and the province of Miasmis. Near the settlement of Imponan and on the gulf of Maca-

jalar there are said to be many square kilometers of gravel carrying large quantities of gold, with which is associated platinum. The product of this district was estimated some years since at 150 ounces per month, all extracted by natives with bateas or cocoanut shell dishes.

SOUTH AFRICA.

The February production of the mines of the Rand district was 404,335 ounces, 410,145 ounces in January, 297,975 in February, '98, 211,00 in February, '97. For the first two months of this year the production was 814,480 ounces, against 611,801 in the like period of '98, 420,882 in '97 and 315,196 in '96.

South African *Mining Journal*: The City and Suburban has an extraction of 85.08%, or 12.26 dwts. per ton milled. During the past year 12,964 feet of development has been done and it is estimated 484,000 tons of ore are in sight.——Some changes are to be made at the New Primrose. The headgear is to be heightened 10 feet, room is to be made for a new sorting belt 50 feet long and new ore bins 200 tons capacity erected. When these changes have been made the output will be increased to 200 tons daily.——At the Geldenhuis Deep the engine at No. 2 shaft is being dismantled and a Whiting hoist being substituted.——The directors of the Geldenhuis Estate & G. M. Co. issued their report which covers a period of nine months, as it has been decided to close the financial year on December 31st. The profit and loss account shows that for nine months the company has been making an average profit of £25,018 19s 1d per month, or a total profit of £225,170 12s 1d. After the payment of 97½% in dividends, equal to £195,000, a balance of £125,270 16s 1d remains. Working costs stand at 18s 0.675d per ton, as against 19s 2.654d in the previous year. The yield works out at 46s 3.074d per ton, and the profit per ton is 28s 2.399d.

Mining Journal: The west shaft of the Knight Central, near Johannesburg, has reached the second of the low-grade reefs overlying the main reef at a depth of 1958 feet.——At the Glencairn, on the Rand, 300 native workers have been added to the force. A forty-drill compressor has been put in, and at the cyanide works electricity has given way to a rope drive from the mill countershaft.——The Nigel Deep, Witwatersrand, is a new producing property started in February.

Gold Fields News: Tenders have been given out for the erection of a new 80-stamp mill (1250-pound stamps) at the Sheba mine, for which the material is already being shipped.

THE KLONDIKE.

Following is a table of distances from Dawson City to the following points:

	Miles.
Fort Alliance	4½
Forty Mile	50
Fort Cudahy	50
Boundary Line	80
Eagle City	105
Seventy Mile	125
Circle City	320
Minook	650
St. Michaels	1,325

Personal.

H. A. LEE has been reappointed Colorado State Inspector of Mines.

J. W. NEILL has returned to Salt Lake City, Utah, from the East.

I. S. EDWARDS, late Supt. Chloride Point, Utah, M. Co., has resigned.

E. J. OLIVER is assayer at the Santiago mine, Fuerte, Sinaloa, Mexico.

W. F. C. HASSON, electrical engineer, is going from San Francisco to Honolulu.

JAS. HUTCHINSON is the Mgr. of the Con. Florida Mt. and Trade Dollar M. Co.'s, Idaho.

D. E. BIGELOW of the Union Iron Works of San Francisco has returned from Randsburg, Cal.

H. G. MURRY of Angels, Cal., has been appointed Supt. of the Lightner mine in that town.

LEWIS B. SKINNER, representing the Western Chemical Co., Denver, Colo., is visiting California.

FRED R. MELLIS of Baker City, Or., has been appointed Oregon's commissioner to the Paris Exposition.

F. F. OSBISTON, an old Comstock miner, has gone to New South Wales and is located at Campbelltown.

VICTOR M. CLEMENT AND R. T. GEMMELL have been making an examination of mines in southern California.

B B. THAYER is now permanently located at Pinos Altos, New Mexico, in the interest of the Hearst estate.

F. J. V. SKIFF is director of U. S. mining exhibits at the Paris Exposition, with present headquarters at Chicago.

J. P. HORGAN is the new Supt. Penna. M. & M. Co., Prescott, Arizona. E. E. Wann of Cripple Creek, Colo., is the Gen. Mgr.

H. MEADE, who for some time has been Supt. of the Little Butte mine at Randsburg, Cal., has taken charge of the Barstow, Cal., mill.

JNO. F. STEVENS has been appointed chief engineer Great Northern Ry., with headquarters at St. Paul, Minn., at an annual salary of $25,000.

LIEUT.-GOV. NEFF, Pres. California State Miners' Association, will not leave for the Hawaiian Islands, as contemplated, till next August.

MR. ROBT. S. MOORE AND MR. W. H. TAYLOR of the Risdon Iron Works, San Francisco, are expected to return from the Hawaiian islands next Saturday.

AT the annual meeting last Wednesday of the Manufacturers' & Producers' Association the following officers were chosen for the ensuing year: President, A. Sbarboro; first vice-president, J. W. Kerr; second vice-president, F. L. Brown; third vice-president, J. P. Currier; treasurer, A. Sbarboro; secretary, Lewis R. Mead.

H. WILSON, for several years chief engineer of the Broken Hill Proprietary Co.'s mines, N. S. W., has taken a similar position with the Austral Otis Engineering Co. of South Melbourne, Australia.

A. M. HUNT, electrical engineer, is on the Atlantic coast, looking at extensive electrical plants, in view of the requirements of the new Spreckels Independent Electric Co., recently organized in San Francisco.

J. W. NEILL, Gen. Mgr. of the United States M. Co., which recently bought the Niagara, Old Telegraph and other mines at Bingham, Utah, has returned to Bingham from the East to take charge of the property.

W. J. PETERS AND A. BROOKS, government geologists, will this season explore the sources of the Copper, Tanana and Habesna rivers, Alaska. F. C. Shrader and assistants will explore the headwaters of the Koyukuk in the Arctic circle. Both expeditions are sent out by Director Walcott of the U. S. Geological Survey.

Industrial Notes.

—The workable area of coal beds in Colorado is 18,100 square miles.

—Panama canal agents are at Jamaica to get 1000 additional workman.

—Denver's 150 miles of street railway are now operated by one consolidated company.

—The Southern Pacific Co. of California has ordered thirty-six new locomotives and 3000 additional freight cars.

—The prodigal sun in California valleys consumed considerable moisture this week, but all accounts point to big crops.

—Six months ago in the Argentine Republic a United States dollar was worth $3.60 in the legal currency of that country. It is now worth $2.

—During 1896-97 Mexico exported more tobacco to Cuba than to all the rest of the world. It reached the United States as "Havana" cigars.

—The subscription for the 6% first mortgage gold bonds of the Southern California Power Co. of Los Angeles, Cal., was closed in Boston last week. The bonds were largely oversubscribed.

—At San Francisco the business at the custom house has increased to such an extent that the Collector of the port has petitioned the Treasury Department for twenty additional inspectors.

—The Silverton, Gladstone & Northern Railway Co. has incorporated at Denver, Colo., capital stock $200,000, to build a railroad from Silverton, in San Juan county, to Lake City, in Hinsdale county—thirty miles.

—The El Paso & Northwestern is to be extended beyond White Oaks, N. M., and on the Kansas line. The road is now eighty miles in length and an eighty-mile extension to the coal fields is now being graded, over which trains will be running by August 1st.

—The Bank of London and Mexico in the City of Mexico will raise its capital $7,500,000, making it $17,500,000. A Mexican banker says: "If the United States annexes Cuba, our exports will have to encounter a formidable competition, and it will be necessary to furnish money at cheaper rates."

—William J. Ryan, a Denver, Colo., mining engineer, who recently made an extended trip through the States of northern Mexico, says that the people of that section of Mexico do not desire annexation. "Every Mexican above the peon class is making money. The mines are paying, agriculture is paying and the other industries are paying. They welcome Americans, especially those with capital, for what Mexico needs is brains, push and capital. Americans are afforded every facility for the development of business enterprises. Mexican mining laws are the best and most liberal in the world, and every protection is afforded to American investments. The mining laws are more liberal and better codified, as well as more uniform, than those in the United States or Canada, and there are no vexatious restrictions or taxes. The only tax to amount to anything is the 10% export tax on gold, which no one complains about."

—An unauthenticated statement is to the effect that by the recent acquisition of a small railway line from San Francisco to Santa Cruz, Cal., the Vanderbilts will, at the latter place, create a terminus for a transcontinental line of railway. The N. Y. Central from N. Y. City to Buffalo; the Lake Shore thence to Chicago; the Chicago & Northwestern R. R. to Omaha; the Union Pacific to Salt Lake City, Utah; the extension to Los Angeles are the links in the line that it is said the Vanderbilts contemplate in securing a through line from the Atlantic to the Pacific. The MINING AND SCIENTIFIC PRESS doubts the truth of the statement. The Vanderbilt policy has always been to get supreme railroad control east of Chicago and do nothing west of that city. The first Vanderbilt line was the N. Y. Central, 442 miles from New York City to Buffalo, N. Y. This absorbed the Lake Shore, 540 miles from Buffalo to Chicago. This nearly 1000 miles constitutes the main thoroughfare between the first and second cities of the country. It is possible that the great development of the West and the Pacific coast may occasion a desire on the part of the Vanderbilt interests to enter that field. The conditions are favorable. The Chicago & Northwestern runs direct from Chicago to Omaha, where the U. P. begins, the latter through its present building lines reaching for Pacific termini. But it is not likely that the statement now appearing is more than an outlined possibility.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 4, 1899.

622,322.—EMBALMING BOARD—Boettiger & Schlueter, Woodland, Cal.
622,200.—FIRE KINDLER—L. & A. W. Brandt, Stockton, Cal
622,416.—ADVERTISING DEVICE—E. Cherry, Santa Rosa, Cal.
622,452.—DYNAMO—F. H. Donaldson, Garvanza, Cal.
622,333.—SURGICAL APPLIANCE—G. E. Dudley, Oakland, Cal.
622,421.—HARVESTER REEL—E. L. Fissel, Davisville, Cal.
622,215.—PRUNE DIPPER—E. C. Frazee, Santa Rosa, Cal.
622,216.—FRUIT GATHERER—E. C. Frazee, Santa Rosa, Cal.
622,619.—WEIGHING SCOOP—Granat & Lamott, Stockton, Cal.
622,356.—CURTAIN STRETCHER—H. Hickman, S. F.
622 365.—EARTH AUGER—T. J. Hubbell, Santa Cruz, Cal.
622,487.—STREET SWEEPER—T. R. Jones, Sacramento, Cal.
622,491.—BUTTER WORKER—J. T. Killin, Greenville, Or.
622,371—LOCK—G. W. Kunze, Bryant, Wash.
622,382.—DUMPING CAR—M. J. McKinnon, Portland, Or.
622,248.—ICE CREAM FREEZER—E. D. Middlekauf, S. F.
622,251.—RIVET HOLDER—Z. S. Moore, Oakland, Cal.
622,530.—MITER—V. A. Pernot, Colegrove, Cal.
622,531.—CONDUIT THREADER—F. A. Pooler, Los Angeles, Cal.
622,532.—GOLD DREDGER—R. H. Postlethwaite, S. F.
622,317.—INVALID'S BED—L. Zucker, Oakland, Cal.
30,463.—DESIGN, HAT HOLDER—Sarah E. Griggs, Woodland, Cal.
30,501—DESIGN, BICYCLE PANTS GUARD—J. F. Wright, Stockton, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR HAT HOLDER.—Sarah E. Griggs, Woodland, Cal. No. 30,463. Dated April 4, 1899. This design comprises a rectangular fork formed of wires twisted together, the arms of the fork joining in the center, extending downwardly at right angles, and the twisted wires of which the stem is formed being coiled to form an inverted conical cut at the bottom of the stem. The two arms of the fork extend upwardly, approximately parallel at a distance apart, and at the top these arms are separated and bent to form rectangular heads which have their greatest length horizontally and are made concavo-convex. The outer edges of these bars may be serrated.

FRUIT GATHERER AND GRADER.—Edwin C. Frazee, Santa Rosa, Cal., assignor to Henry DeWitt Frazee, same place. No. 622,216. Dated April 4, 1899. The object of this invention is to provide a device for gathering and grading fruit, and it is especially adapted for gathering prunes, plums and other similar fruit which it is desirable to protect from being bruised, and also to separate into sizes as well as to clean them from leaves, sticks and dirt which may fall in with them. It consists essentially of a wheeled truck, the front of which is adapted to fit around the body of the tree. Upon this is a flexible, foldable and extensible hopper connecting with the truck sides, and a screen is fitted between the front extended ends of the truck which is adapted to receive and clean and grade the fruit which first falls upon the canvas or other flexible sides of the hopper and is directed down to the screen on these sides. The shaking device consisting of a reciprocating toothed bar and corresponding teeth upon the edge of the screen frame, and a pitman or crank connected therewith, serves to agitate the screen to separate the sticks and dirt from the fruit.

DEVICE FOR PENETRATING FROZEN EARTH OR GRAVEL.—T. J. Hubbell, Santa Cruz, Cal., assignor of one-half to Frank Fisher of San Francisco, Cal. No. 622,365. Dated April 4, 1899. The object of this invention is to provide a small, easily adjusted apparatus so constructed that it may be folded into a small compass for transportation, and which when set up is adapted to penetrate ground filled with small roots, gravel, or rock, or ground which is frozen hard, and which is in other ways difficult to penetrate. It is especially adapted for the drilling of prospect holes to ascertain whether the particular location contains gold or other valuable substance which it is desirable to obtain. It consists essentially of a perforating tool, a shank and means for connecting it therewith, a framework having upper and lower cross timbers and guides, through which guides the shank passes loosely, one being fixed and the other adjustable to bring them into vertical line; attachments for guy ropes by which the frame may be braced when set up, and adjustments for the length of the legs of the frame to suit it for uneven ground, and a turning handle by which the tool may be operated.

PRUNE DIPPER.—Edwin C. Frazee, Santa Rosa, Cal., assignor to Henry DeWitt Frazee of same place. No. 622,215. Dated April 4, 1899. This invention relates to a device for preparing prunes for drying. It consists essentially of a dipping tank, a basket having closed sides and a foraminous bottom and closed projecting ends adapted to rest upon the front and rear edges of the tank when the basket is submerged, one of said ends having upturned lips to form a discharge for the basket. Sockets are formed approximately central of the upper edges of the basket sides, and lever arms having bent portions which extend toward the sides of the basket with end journals upon which the sockets are suspended to swing. A shaft is journaled upon the front edge of the tank with which the arms are connected and a fulcrumed hand and foot lever and pitman connect the lever with the crank so that the basket may be raised from the tank. By means of a checking device the front of the basket is arrested after it has been raised from the tank, and this forms a fulcrum about which the rear portion of the basket is lifted and turned to discharge its contents.

CURTAIN STRETCHER.—Henry Hickman, San Francisco, Cal. No. 622,356. Dated April 4, 1899. This invention is designed for the stretching of lace curtains and the like so as to make them absolutely even in length and to cause the pattern and figure to exactly correspond, and the curtains to hang properly when in place. It consists essentially of a four-sided rigid frame having a brace bar connecting the side bars interior to one end with adjustable longitudinal and transverse bars connecting the end and side bars respectively, and means for detachably clamping the adjustable bars in place so that one end of each adjustable bar may be so swung inwardly to allow the edges of the curtain to be attached to pins which are fixed upon the bars, the edges of the bars being curved or beveled to form sustaining seats for the edges of the curtain.

EXTENSION REEL FOR HARVESTERS.—E. L. Fisel, Davisville, Cal. No. 622,421. Dated April 4, 1899. The object of this invention is to provide a reel such as is used for sweeping grass or grain toward the cutting sickle, and said reel is made adjustable to larger or smaller diameter to suit the condition of the grain which is to be acted upon. It comprises a central shaft with radial arms having guides supported upon them, supplemental arms slidable in the guides having reel bars fixed to the outer ends, rods divergent in planes which intersect the longitudinal axis of the shaft, and means for moving the rods in their supports longitudinally so that the radial arms carrying the bars upon the outer arms may be extended or shortened.

Commercial Paragraphs.

W. N. JEHU has moved his assay office from 536 Merchant St. to 606 Clay St., San Francisco—a larger and better location.

SMITH & THOMPSON, manufacturers of assay balances, Denver, Colo., have opened very neat salesrooms at 2205 Champa St., that city.

THE Denver Engineering Works Co. recently shipped a carload of electric hoists to Cripple Creek, a mine timber framing machine to Salt Lake City and one to Aspen, Colo.; also a 5-stamp sectional mill to Mexico. They have orders for a 150 H. P. electric hoist for Rossland, B. C., which, it is claimed, will be the largest electric hoist ever built in Colorado. They report the shipment of a carload of jigs and screens to Empire, Colo., and a 100 H. P. steam hoist to Prescott, Ariz.

THE Rix Engineering & Supply Co. have been awarded the contract for building a 4-stage air compressor to compress air to 2500 pounds to the square inch. This compressor is for driving compressed air auto-cabs and omnibuses in Chicago. The order comes from a Chicago firm, which lends interest to the matter, inasmuch as this is the first compressor ever built in California and shipped directly to the Eastern market. The cylinders are all arranged tandem to the steam cylinder, which drives them. The pressures in the cylinders will be respectively 45 pounds, 180 pounds, 700 pounds and 2500 pounds. These pressures divide up the heat and work evenly. The heat is taken out between the different stages of compression by passing the air through copper intercoolers located in the base of the compressor. This compressor will be tested about May 1 in San Francisco, and 2500 pounds to the inch will be pumped into a receiver. There is an opportunity at this test for anyone having any apparatus for liquefying air to make experiments. Mr. Rix, of the above firm, is now designing an apparatus for liquefying air and hopes to have it completed in time to use the above-described compressor to furnish the air for the experiment.

Catalogues.

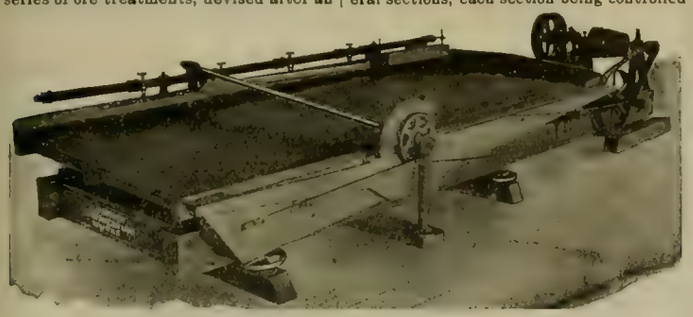
In last Saturday's issue considerable was said about machinery catalogues, their handsome appearance, progressiveness and technical value. These statements are emphasized by the receipt this week of three new catalogues—The Evans No. 5, Milling Machinery No. 12, and Gold Dredging No. 17—just issued by the Risdon Iron Works, Howard and Beale streets, San Francisco. Catalogue No. 5 is the third edition of that particular trade treatise on hydraulic mining machinery and the Evans hydraulic elevator in particular, the latter being especially of present prominence because of its use as the principal and necessary device in the work now going on of unwatering the old, deep, abandoned lower levels of the Comstock. The tables in this are of especial value to mining men. Catalogue No. 12 is the second edition of a treatise on milling machinery, illustrating and describing several forms of machinery and discussing different processes for working ore. Of considerable value also are the actual results, such as the Alaska-Treadwell Co.'s milling account for one year, the cost of one month's mining and milling in Amador county, Cal., "the history of the patio process," etc. Catalogue No. 17 is also in its third edition. It treats exclusively of gold dredging machinery, a branch of gold mining that seems destined to be as prominent in California as it has been proved in New Zealand. Of this pamphlet it may be said that no matter how much anyone knows about river dredging for gold he will very likely increase his knowledge by reading it. Catalogue No. 5 is sent postpaid from the Risdon Iron Works office to any address on receipt of 15 cents; catalogue No. 12, 50 cents, and catalogue No. 17, 15 cents.

The Cammett Concentrator.

Bulletin No. 1, issued by the Denver Engineering Works Co., is devoted to a discussion of concentration of ores and mainly a description of the Cammett concentrator, which they manufacture and supply. In the circular they say:

The development of milling processes for the concentration of metalliferous ores has presented many opportunities for some successful design of concentrating table, which will give accuracy and capacity by the employment of simple mechanical details and a system of ore treatment based on well established laws.

We maintain that no concentrator can be a complete system in itself, but simply one part of a series of ore treatments, devised after an intelligent study of the ore to be treated. The preparation of the ore, in the preliminary crushing by crushers, rolls or stamps, and subsequent classification, is just as important as the separation of the values from the gangue on the concentrating table itself. The experiments of Rittenger, and in later years those of Robert H. Richards, have shown that each size and quality of ore pulp requires a certain angle of inclination of the table surface, a proper supply of water, a correct speed of agitation, and a motion which best assists the laws of specific gravity. Hence it seems rational that a concentrating table, embodying as many suitable adjustments as possible, should best meet the wide field of variations required in the successful treatment of pulps.

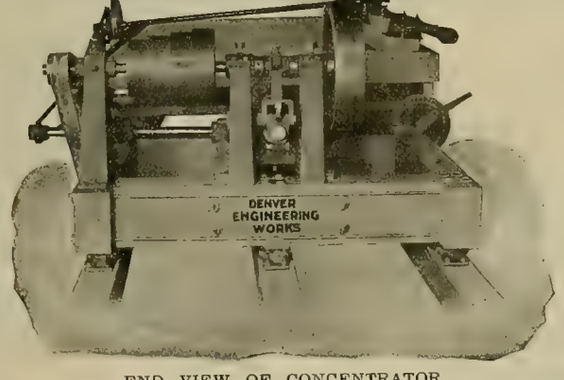


GENERAL VIEW OF CONCENTRATOR.

The Cammett concentrator is presented as a result of a thorough and systematic series of practical tests. All the details have been decided upon after actual practical tests, and the mechanical features of this concentrator are based on an accuracy of motion and a facility of adjustment which are ackowledged to be complete in every respect.

HEAD MOTION OF CONCENTRATOR

Description of Details.—The main frame of the table is made of best selected Oregon lumber, and framed to resist best the reciprocating movement of the table top proper. This frame, together with the upper working parts, is supported on three heavy hinges under the head end of the table, and by means of adjusting hand wheels and screws, the table may be given any necessary inclination lengthwise the table. The discharge end of the table may also be adjusted by means of these adjusting screws, so that one corner at the end may be raised higher than the other, depending on the requirement of the ore treatment. Hand adjusting screws, under the main frame about midway the length of the frame, serve to prevent any vibration whatsoever. The table top proper is supported on nine (9) cold drawn steel guides running on cast iron bearings, and lubricated by compression grease cups. These guides are supported on cross beams, which are also supported on one end by heavy hinges, and on the other by cams designed to give the requisite transverse inclination to the table top. This transverse inclination motion is controlled by a lever placed near the head of the table. The head motion is a simple mechanical device which is capable of producing a great variation in the revolutions, stroke, and character of the stroke. The revolutions may be changed, by a four-stepped cone, from 250 to 350 revolutions per minute; the stroke adjustment is from 0 to 1⅛ inches length; and the quality of the end reciprocation is such that pulp may be carried forward at any speed from 0 to maximum. The end reciprocation is not a sudden jerk, but a very smooth motion, and is a particular motion peculiarly adapted to proper stratification of the pulps. The pulp box is arranged with suitable partitions for delivering the pulp to the table in a manner well distributed. The water is delivered to the table by means of perforated pipes in several sections, each section being controlled by a separate valve. The perforations of the pipes are on the upper side of the pipe. Whenever a mill contains only one concentrating table, a return pump for the middlings is provided. This pump delivers the pulp, not into the main pulp box, but into a separate launder, which is arranged to deliver the middlings pulp along a considerable range up and down the table.



END VIEW OF CONCENTRATOR.

The table top is made of selected redwood, in two layers, with a canvas, painted with white lead, between the layers of redwood to prevent leakage. Each layer of redwood is grooved on the under side to prevent any warping, and the construction proves to be successful. The entire table top surface is covered with a special design of continuous riffles and grooves extending longitudinally from the head end to the discharge end of the table. The entire surface of the table is painted with paint specially prepared for this work.

The floor space occupied by this concentrator is 7 feet by 19 feet. With this table and included in the price are all attachments necessary for the complete operation of the table, and no expense is required to make table ready for running except that for labor of erecting.

To determine the power required to drive this table, a table was set up and run by an electric motor deriving its power from the electric plant at the works, and the power delivered to the motor was accurately measured by proper electrical instruments. It was found that with all adjustments of the table put at their maximum the power did not exceed 0.4 H. P. Under adjustments which would represent average working in practice the H. P. did not exceed 0.25.

Operation of the Table.—The pulp, after being properly sized in hydraulic classifiers, is delivered onto the table by the pulp box at one of the head end corners of the table. After giving a proper inclination, both transversely and longitudinally, to the table top and a supply of water through the various water pipes, the head motion may be adjusted to meet the requirements of a great variety of ore pulps. The end shake of the table produces a stratification of the pulp which settles the values to the bottom of the grooves, and carries the mass along until the height of the riffles between the grooves diminishes, and the transverse flow of water washes the light top layer of gangue across the table sidewise to the tailings launder. The heavier values proceed along the grooves without disturbance or change from a straight forward course, and are discharged from the entire width of the tail end of the table.

In plants where only one table is used the middlings pump returns the middlings back to a special launder on the upper side of the table. In plants where several tables are used we recommend the middlings from the several tables to be carried to a table which is especially adjusted for this class of pulps. In many cases these middlings would need to be recrushed for subsequent concentration.

While this concentrator will handle as coarse pulps as any of its class, we find it extremely accurate in the saving of fine pulps. The special form of grooves which we employ seems to produce very successful results in keeping the fines from discharging with the tailings.

So perfect is the classification or separation produced by this table that with a good class of ore adjacent grooves of the table will contain products differing from each other to such a degree as to be readily distinguished from each other by the eye.

This concentrator is manufactured under license from patent serial Nos. 614,322, 651,877, and 668,419; also other patents applied for.

The main office of the company is Thirtieth and Blake streets, Denver, Colorado.

How to Build a Rocker.

Written for the MINING AND SCIENTIFIC PRESS.

The accompanying drawings show the simplest form of construction in a rocker or cradle for separating gold from debris with the use of water. Miners are mostly familiar with the old rocker, but those who have newly engaged in the alluring pursuit of gold mining may find this sketch useful. Fig. 1 shows the rocker complete: *A* is a cleat tacked to each side of the interior to hold an apron (Fig. 3); *S* is the screen, riddle or hopper into which the gravel or other material to be tested is placed. It may be built of 1x4-inch board. The bottom is covered with a perforated sheet of iron or a coarse wire screen (½ inch). The hopper sets inside the upper portion of the body of the rocker, resting on cleats nailed to the side shown at *B* (Fig. 2).

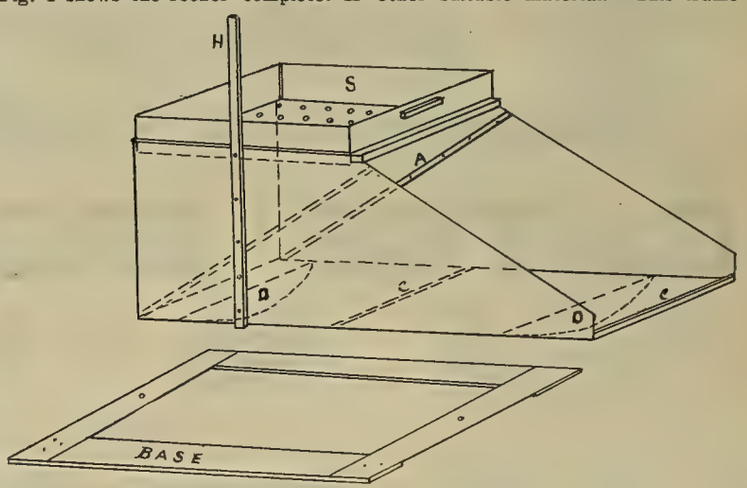


FIG. 1.—THE ROCKER AND BASE.

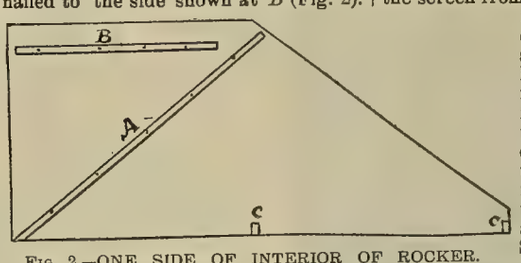

FIG. 2.—ONE SIDE OF INTERIOR OF ROCKER.

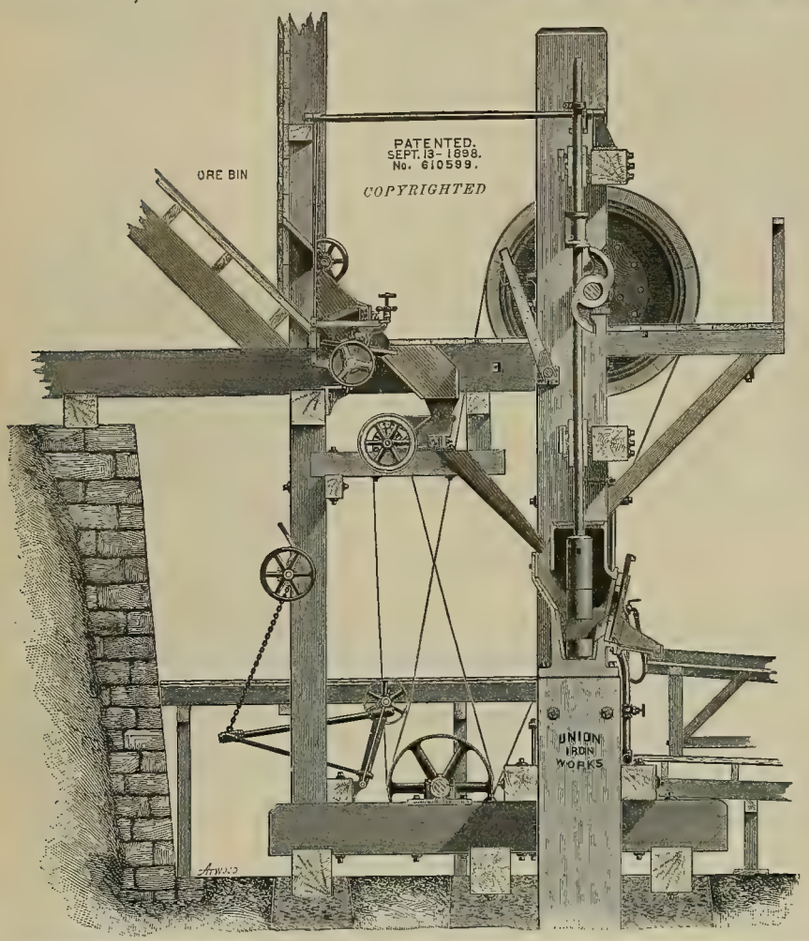
The apron is a frame of sticks ½x¾ inch firmly nailed at the corners and having "legs" at the lower end formed by the projection of the side pieces beyond the lower cross piece. Upon this frame a piece of canvas should be securely tacked, but it must "sag" at least an inch (more is better) at the lower end, indicated by the shaded portion Fig. 3, so that the earth falling through the screen upon this apron would be concentrated in the depression of the canvas, the lighter material passing over and the heavier (gold, iron, garnets, etc.) remaining upon the apron. This apron slides in from the top in front of and underneath the screen and may be quickly drawn upward and out and its contents dropped in a pan for further concentration. As an additional precaution riffles are placed in the bottom of the rocker, formed by nailing cleats across the bottom, as shown at *C C*, and are placed one midway and the other at the lower end.

FIG. 3.

Two segments of a circle are firmly nailed to the bottom of the cradle, underneath, forming "rockers," that the whole structure may be rocked backward and forward much like a child's cradle. These "rockers" should be provided with a piece of iron (a large nail will answer) fitted into the lower edge and projecting about an inch. The rocker is placed upon a frame made of four pieces of 2x4 or other suitable material. This frame should be bored with two holes at the proper distance to receive the lugs in the bottom of the rockers. This will keep the rocker from moving forward when in use, as the frame upon which it rests is stationary but is given more or less grade, to be determined by trial. The vibration or rocking motion is given by means of the handle *H*. Water is poured upon the material in the screen from a long-handled dipper in the hand of the operator. The rocking should be continuous as long as material remains upon the screen fine enough to pass through it. Stones and other objects remaining upon the screen may be removed by grasping the hopper in both hands and tossing them out. Several hoppers of gravel may be washed before cleaning up if desired. The operation of dipping water with one hand while vigorously shaking the rocker with the other is rather awkward to the beginner, but one soon becomes accustomed to it. Where the quantity of water is small a dam may be built which will provide enough for use, the water running back into the basin and being re-used until too "thick" with fine slimes.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

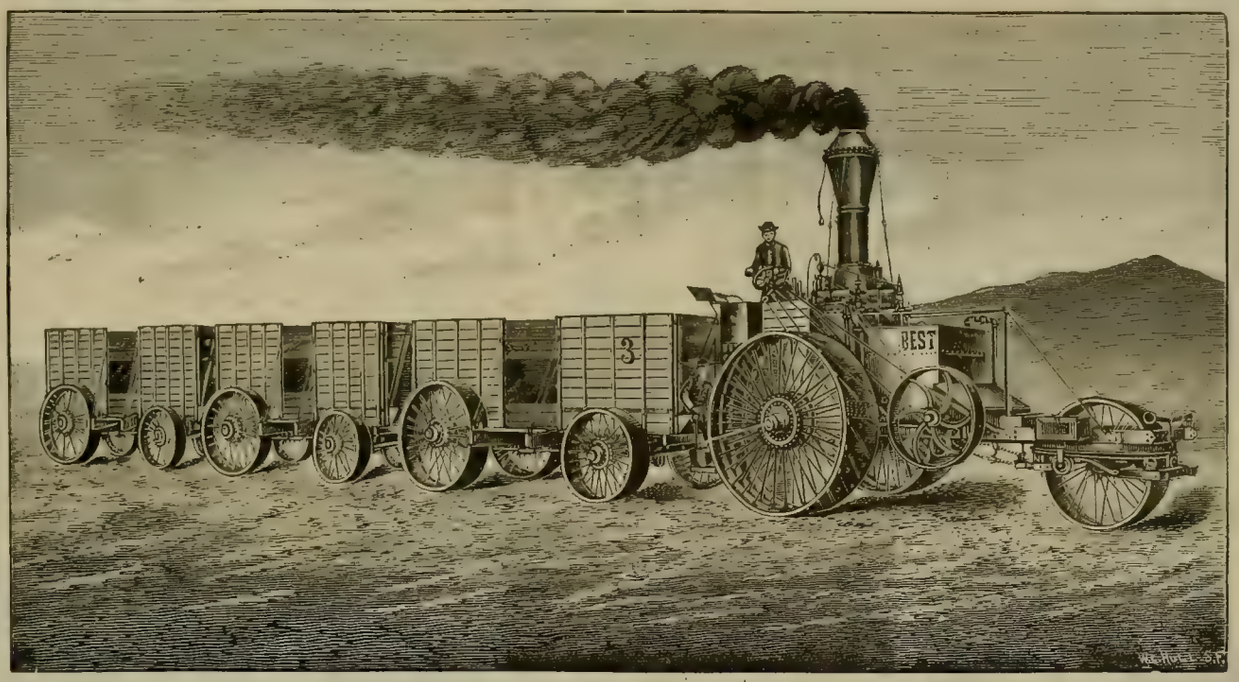
DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

A REVOLUTION IN FREIGHTING.



THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

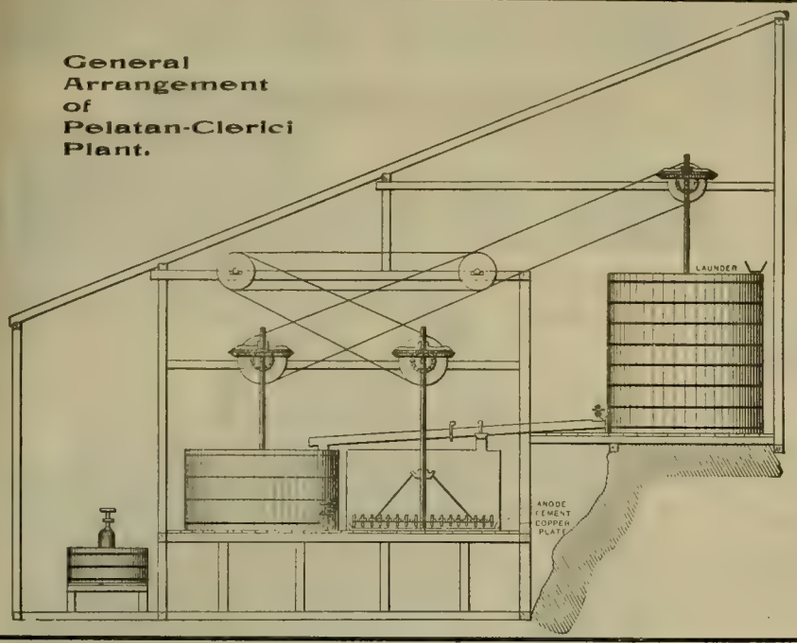
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

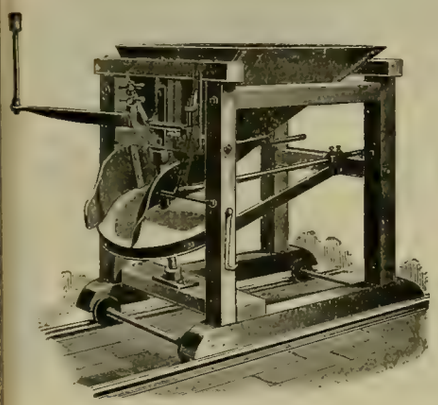
Saves more than 85 per cent by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge.

Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

THE RISDON IRON WORKS,
SAN FRANCISCO,
AGENTS.

HAVE YOU EVER INVESTIGATED THE ADVANTAGES OF



...BOLTHOFF'S...

Improved Challenge, Automatic Revolving Disc Ore Feeder?

It is operated by a friction band. THERE ARE NO GEARS OR CLUTCHES. Gives a POSITIVE FEED for WET or DRY ORES. Feeds FAST or SLOW. It is exceedingly popular with all mill men who have used it.

WRITE US FOR PRICES.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POST-PAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 180 pages, illustrated....$1

ASSAYING:—PARTS II & III—GOLD AND SILVER BULLION, LEAD, COPPER, TIN, ETC.
Latest edition; 161 pages, illustrated, cloth. Much of the original text replaced by new matter....$1 75

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus....$3

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast....$2

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions. Well illustrated. Cloth....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. & W. Lock. 472 pages, illustrated, flexible leather....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated....$5

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M....$1 50

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50c

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall....$2

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

COKE. — Foreign, $13; domestic, $12 per ton.

CHEMICALS. — Cyanide of potassium, jobbing, 32 @ 33c per lb.; carloads, 30c; in 10-lb. tins 37c; sulphuric acid, 2c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 4½c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9½@10c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 15c; chlorate of potash, 25c; caustic potash, 12c.

Consul Skinner writes from Marseilles: "There is a considerable advance in the market price of sulphate of copper, which is quoted in this city at 64 francs ($12.35) per 100 kilograms (220 pounds). The price named is about 5 francs (96 cents) above the ordinary price for the quantity named. Large quantities of sulphate of copper are used in the wine-growing districts to counteract the pernicious effects resulting from the various cryptogamic diseases to which the vines are subject. During the year '98 there was exported from the United States sulphate of copper to the extent of 14,529,466 pounds, valued at $466,244. On these terms it would seem as though a considerable business might be done in France, especially under existing market conditions."

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5¾c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¾c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

Books Received.

"*Hints on Amalgamation and the Care of Gold Mills.*" W. J. Adams, San Francisco; 111 pages, octavo, illustrated, neatly bound and full of concise but sufficiently comprehensive information for the mill man, whether experienced or not. A chapter is devoted to the characteristics of gold ores and methods of handling them. Then in turn are treated amalgamation, cleaning up, retorting and melting. The last chapters contain some practical suggestions on concentration of auriferous sulphides, particularly the fine high-grade varieties. The publishers are the Modern Machinery Co. of Chicago, Ills.; price $1.50.

Assessment Notices.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1899, an assessment (No. 9) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 1st day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California. Office hours from 1 to 3 P. M.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of March, 1899, an assessment (No. 18) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of April, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOYONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of April, 1899, an assessment (No. 24) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

HEAD CENTRE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tombstone Mining District, Cochise County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1899, an assessment (No. 7) of twenty (20) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of May, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of he corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard. We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogues Nos. 15 and 16.

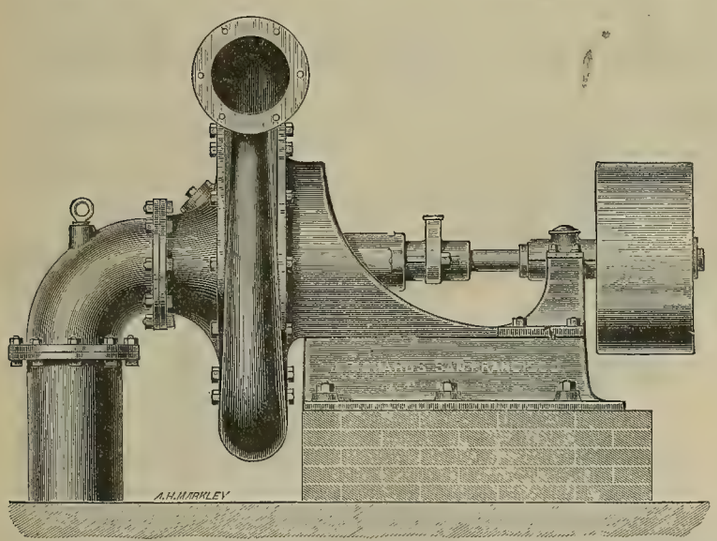
WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE MOST WATER FOR THE LEAST MONEY!



For low lifts and large volume of water a Centrifugal Pump cannot be excelled.

We make the RICHARDS PATENT CENTRIFUGAL PUMP. Single suction, consequently less tendency to churn. Perfectly balanced runner. Protected bearings. Removable side plates. Accessible runner. Runners made of diameter to suit the lift. Will not churn at high speed.

Our 1899 catalogue tells about over fifty different kinds of pumps. Free to those interested.

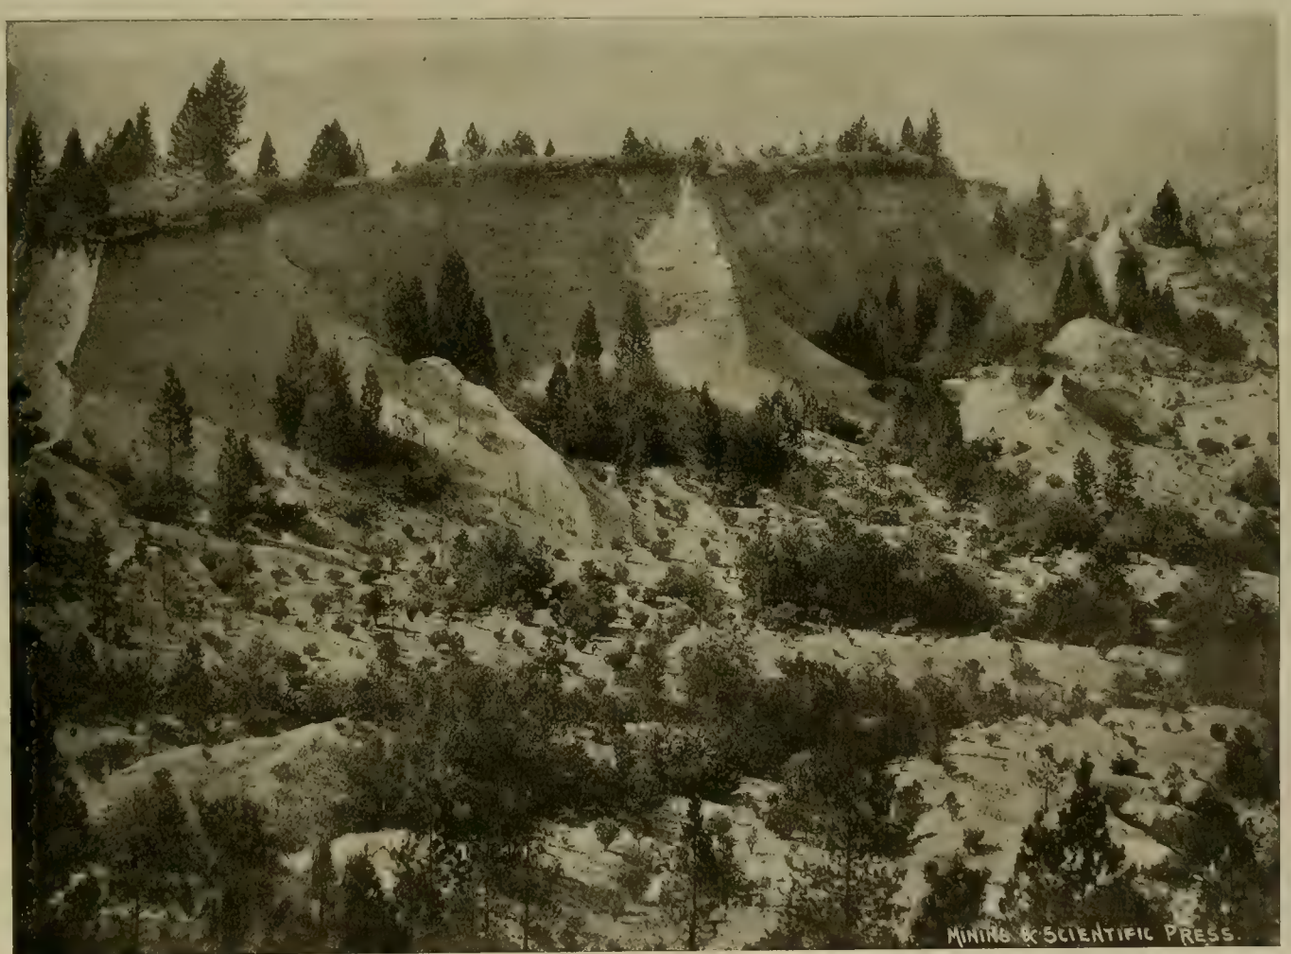
The Growth of Trees in Denuded Areas.

When mining operations first commenced in California practically nothing was known of the conditions under which the much-coveted gold existed. The beds of the recent gulches and streams were the first to receive attention, for in these nature had concentrated the golden lumps and grains. The harvest was plentiful indeed. These crude mining operations led the workers to two sources from which the gold was derived. The first and really the primary source was the quartz veins. The second was the gravel deposits of the ancient rivers, which were, in fact, placers of an earlier age, originating in a manner identical with the formation of the more recent gulch and river deposits. In the smooth, rounded slopes of the rolling foothills of the Sierra Nevadas these early miners did not recognize this detritus as lying on the beds of prehistoric streams. Indeed, how could they? What was there to suggest it? The drainage system was perfect; these pine-clad or brush-grown slopes looked much the same as pine-clad and brush-grown slopes elsewhere. But soon the long lines of ditches and flumes lined the hillsides and the huge monitors were directing great volumes of water under tremendous pressure against these mounds of gravel, and the hills disappeared as snow banks melt under the rays of the spring sun. Great crater-like gaps were made in the hillsides. The effect was beautifully picturesque, too. The dark green of the pines and the lower tone of the sombre, greenish-gray of the chaparral and manzanita-covered hills were brightened by dashes of vermillion, buff and white, the prevailing colors of the oxidized portions of the gravel channels. The brush and even the trees were torn from their foothold in the gravel hills by the irresistible force of the hydraulic giants. The pits extended in length until they became valleys, miles in length, bright in color and remarkable for many curious features, of which not the least interesting were the immense boulders, entirely foreign to any rock in the vicinity. These valleys, the handiwork of the California miner, were treeless and more barren than the burning sands of the desert, for on these arid wastes one finds numerous trees and shrubs, and also many beautiful flowers, apparently as fresh and vigorous as any carefully reared plant in the semi-tropical gardens of California.

The hydraulic pits were cut down to bedrock, which, with its inequalities and absolute destitution of soil, offered little hope of the renewed growth of vegetation. Boulders, great and small, were strewn along the entire length of the artificial valleys, only adding to the desolation as well as the picturesqueness of the scene. It afforded an interesting study for the geologist, but the student of botany would have found little of interest there, unless it were to observe how completely all trace of vegetation and the soil that sustained it had been swept away. To have predicted at that time that trees and brush and flowers would grow again on these denuded tracts would have seemed to have required a stretch of imagination, but the same forces which in ages result in the degradation of mountains and the filling of deep valleys with the detritus from them were at work immediately, even while the miner was still employed in his work of destruction in his quest for gold. He thought little and cared less about the future growth of a forest on the site of his mine.



THE TREE GROWTH OF LESS THAN FORTY YEARS IN THE PIT OF A HYDRAULIC MINE, NEVADA COUNTY, CAL.

This occurred nearly fifty years ago; but time has wrought a change, and to-day these valleys, which mark the channels of the ancient river courses, are again covered with a growth of pines and other trees, and patches of brush again dot the once verdureless slopes. In another century these valleys will have again become densely timbered and the sharp scarp of their upper edges will have been gently rounded by the hand of time. The illustration accompanying is a characteristic scene in an old hydraulic pit near North San Juan, Nevada county, Cal. It will be noticed that many of the pines have already attained a height of 40 to 50 feet, and the smaller growth gives promise of eventually becoming a forest. The MINING AND SCIENTIFIC PRESS acknowledges its obligation to Mr. Geo. W. Dornin, of San Francisco, who took the photograph from which the accompanying illustration was engraved.

Industrial Notes; Books Received; Trade Publications; Personal; Catalogues; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 438. Recently Declared Mining Dividends; California Mining Incorporations; Commercial Paragraphs, 450.

THE leaven is working. The Franklin Institute of Philadelphia, whose indorsement deservedly carries great weight, has passed a resolution favoring the creation of a Cabinet Department of Mines and urging Pennsylvania's U. S. Senators to support the measure.

THE eight-hour law in British Columbia continues to be a source of trouble. The miners of the Slocan profess to be satisfied with the formerly existing conditions, and the new law is, as yet, inoperative. But at Rossland and some other districts the miners say they will insist upon its enforcement. The Government has the matter under consideration.

AMONG other sensible laws passed by the late Colorado Legislature is one forbidding the use of an iron, steel or other metal tamping bar. It seems strange that such legislation is necessary, for miners fully understand the danger which lies in the use of a steel bar in tamping holes charged with powder. But there is almost daily evidence that miners, surrounded constantly by the dangers incident to their calling, as a class are most heedless to their own danger.

A TEST of the Marconi wireless telegraphy system was made last week at the Washington, D. C., government buildings. The distance traversed by the sound waves was more than a mile. Words were intelligibly flashed through that space without the use of wire. On page 429 is the latest announcement regarding these matters from M. Marconi himself. The subject is an interesting one, but from a commercial point of view it is manifest it will not compete with the present system.

THE question has arisen in the Arizona United States Land Office at Prescott as to the valuation of work performed on a mine in doing assessment work or when application for patent is made. The law states clearly that $100 worth of work or improvements must be put upon the claim annually and that $500 worth of work or improvements are necessary to secure patent, though this latter work may all be done at one time. As to the amount of work requisite to constitute $100 worth or $500 worth, it must necessarily vary with the varying conditions found in different places, and also depends somewhat on the wage rate of each district. The law is specific as to the value of the work, but does not attempt to define how much rock or earth shall be removed, nor say anything of the nature of other improvements to be made.

Light Railway in a Mining Region.

The value of cheap transportation in the development of a mining country's resources is too axiomatic to need discussion. Nothing will so grandly aid the development of mines as a broad gauge plan of narrow gauge railways. Colorado and Arizona well illustrate what railroads can do in bringing a mining region to the front. In the latter Territory the operations of the Arizona Southeastern R. R. is a good example. Long since the Bisbee copper mine owners saw that the day of the mule team and trail wagon had passed, and while the merits of a traction engine were fully recognized, yet, at that time the oil-burning road engine had not arrived at its present improved state, and it was determined to build a light railway. The history of the building of this road was given in these columns at the time, and needs no more than passing reference. The first piece of road—thirty-six miles from Fairbank to Bisbee—was built in '87, on a 2½% grade, 40-lb. rail. In '95 the road was extended nineteen miles to Benson on the S. P. line. Of the entire line, but seven miles are on the level. Following is a record for ten years' work :

	Mileage.		
Year ending June 30th,	*Loaded cars.*	*Empty cars.*	*Total tonnage.*
'89	34,547	24,634	17,018
'90	65,943	43,536	32,934
'91	68,924	40,088	31,389
'92	73,530	48,474	32,345
'93	76,703	50,022	32,470
'94	80,689	59,982	38,014
'95	138,164	108,110	48,425
'96	218 539	152,185	65,905
'97	245,116	188,733	83,659
'98	263,344	156,385	84.739
Total	1,265,499	872,129	466,848

The light rail, the comparative small cost of the road, the amount of business, and resultant profit are sufficiently manifest to make application unnecessary. In Colorado the roads are constantly reaching into apparently inaccessible districts, and their owners and agents are constantly advertising the existence of Colorado mines. In unpleasant contrast is the policy of the principal California railroads, which seem afraid that some one will find out there is a mine in the State, the idea apparently being to stifle and suppress what it cannot usurp or control.

What can be done by a properly conducted and well managed little railroad running into a mining district is well illustrated by the Nevada Co., Cal., narrow gauge road. Run without any mine ownership but as a public business proposition, this line from Colfax to Grass Valley and Nevada City, in the foothills of the Sierras, in '98 earned $116,415 and spent $86,591. During the year the road kept up its equipment, bought steel rails to the amount of $5758, paid $9416 for two locomotives and eight flat cars, paid 7% interest on its bonds and left a dividend surplus.

Some years ago this paper suggested these matters in a series of articles that were the inception of the Sierra Valley Railway, now completed from Oakdale, Cal., to Sonora—forty-six miles, and projected to Summersville, nine miles farther. This is a standard gauge. The result of the building of this road is just what was prophesied in these columns—opening of new mines, resuscitation of old properties, a general awakening to possibilities of profit rendered impossible by the former prevailing era of '49 prices, cessation of which state of affairs was of course strongly opposed by those who believed it would injure their business, but who now with enlarged horizon begin to see wider scope of operations.

ELSEWHERE appears an article entitled "Some Characteristic Features of Veins in Granite in California." A careful perusal of it shows that these veins have certain well-recognized features and that there is little to substantiate the unreasonable prejudice of many against veins in granite. Some of the greatest mines in the world occur in granite. A few years ago it was not at all uncommon to hear the names of various rocks coupled together, mere mention of which was looked upon as synonymous with value. Such terms as "slate and porphyry," or "greenstone and black slate," "limestone and porphyry," etc., were the most common. There is nothing to justify these prejudices. Millions of dollars have been taken from veins in California which occur at or near the contact of black slate and diabase, and probably an equal number of millions have been taken from veins in granite. If a certain contact were all that is wanting, there would be thousands of miles of continuous rich gold-bearing quartz veins in California alone. But the fact that the contact is not so continuously occupied is in itself sufficient evidence that some other condition must exist to insure a profitable mine. As the genesis of ore deposits is better understood, these prejudices disappear, and the miner begins to look for some other indication of value besides the simple contact of certain kinds of rock.

Questionable Mining Schemes.

It is evident from the tone of numerous letters received that the present activity in mining has resulted in the flotation of some mining schemes, the character of which should be investigated, at least, by intending purchasers of stock. It is not at all uncommon to receive inquiry concerning this, that, or the other concern, the whereabouts of whose property can only be ascertained, if at all, with the greatest difficulty, and yet the prospectus of these concerns are most elaborate. One common feature of these wildcats is the coupling of the name of the property they are trying to boost with that of well known producers, the language of the prospectus leading the would-be investor to believe that they either join or are in the immediate vicinity of valuable mines, when, in fact, they may be many miles distant. Old mines with unenviable records are promoted under new names; the names of successful and valuable mining properties are applied, with slight variation, to new ones having little or no merit, actual or prospective, for the purpose of leading the public to believe that when purchasing stock in these concerns they are buying into a rich and going property. These and many other forms of deception are practiced to catch the careless investor. The simple fact of being in the same county, the same neighborhood, or even immediately adjoining a rich mine, gives no actual value to any other mine unless such mine has a valuable deposit of ore within its own ground, except for purely speculative purposes, but the idea is general that the "chances for striking it" are better in the neighborhood of a rich mine, when really there is much doubt about it; but the unscrupulous promoter makes the most of it. When it can be reasonably shown that a known and valuable shoot of ore in a claim passes beyond its end line into the adjoining property, then such mine, owing to its fortunate position, undoubtedly has a certain value.

There are meritorious new concerns in the market where there is a good chance to win by the economical development and operation of a promising prospect, but there are many others which have nothing to recommend them, the market price of the stock of which would indicate an actual cash valuation of many thousands of dollars. The reaction which always follows the bursting of these gilded bubbles has a bad effect on the industry of legitimate mining. Men have the legal right to associate themselves privately, or as corporate bodies, for the purpose of equipping, developing and operating mines, but the law does not give any one the right to make the grossest misstatements concerning their property when the purpose of these misstatements is to deceive.

NO ORGANIZATION has as yet undertaken the formation of a gold mine trust. Here is a field offering the broadest possibilities with the promise of the most satisfactory results. Any association of individuals that could control the gold output of the world would certainly have a fine thing of it. There are greater inducements in this line than in the alluring copper combine now forming. In gold mining there is no competition, no cutting of rates, no likelihood of overproduction or want of consumption; the customer seeks the producer, instead of the reverse, as in every other case; there is a minimum of transportation charges and a maximum of values. It is surprising that ere this some enterprising organizer has not essayed the creation of a gold mine trust. Compared with the petty $100,000,000 and $500,000,000 combines now forming, the successful organizer of such suggested combine would be at the apex of financial greatness.

Concentrates.

SHELDON JACKSON'S Laplander reindeer scheme for carrying mails along the Yukon river is a total failure.

THE New York price of tin Oct. 1, '96, was 13 cents per pound. The New York price to-day is 25 cents.

A CUBIC FOOT of newly fallen snow weighs 5½ pounds and has twelve times the bulk of equal weight of water.

DENVER, Colorado's, Mining Stock Exchange is about to receive a badly needed shaking up and reorganization.

IN a 12-foot boat built with good lines, with a 12-inch propeller, a ⅛ H. P. engine should make six knots per hour.

THE New York City street railways in '98 earned $13 per capita population; those of San Francisco $13.90; in Chicago $9.95.

IT costs about $14,000 to patent an invention "all over the world." There are sixty-four countries in which a patent may be procured.

THE only effectual preventive of electrolysis of water pipes is to have the entire electric power circuit effectually insulated from the ground.

SULPHIDE ores contain a large percentage of pyrites or other sulphides; basic ores contain lime, manganese, baryta, or iron oxide; acid or siliceous ores, quartz, sand, or silica.

WOLFRAMITE is tungstate of iron, and is a black heavy mineral of iron color. Wulfenite is molybdate of lead and occurs in beautiful honey yellow to orange red tabular crystals.

THE exhaust of a gas engine can be muffled to make it nearly noiseless by connecting with an iron box or cylinder of say four gallons capacity, with several diaphragms of ⅛-inch mesh wire cloth.

A SINGLE BELT 1 inch wide traveling at a speed of 1000 feet per minute is capable of transmitting 1 H. P.; a double belt 1 inch wide traveling with a speed of 700 feet per minute has the same capacity.

SUCCESSFUL conversation has been carried on over telephone wires between Little Rock, Arkansas, and Boston, Mass., a circuit of 1900 miles; and between San Diego, Cal., and Boise, Idaho, a circuit of 2100 miles.

ACCORDING to *Comptes Rendus*, the latest determination of the speed of sound has been made by A. Leduc, who finds that the rapidity of propagation of sound waves through dry air at 0° C. (32° F.) is 1088.58 feet per second.

TIME was when a California State tax of 10 cents on transfer of mining stock certificates was a source of revenue to the California State Mining Bureau to the amount of $2500 per year, but the tariff was abolished some years ago.

PROBABLY the cause of the deterioration of aluminum mentioned by E. J. F. of Butte, Montana, is an impurity in its alloying. The presence of sodium even to the extent of only .3 of 1% will make aluminum susceptible of attack by water.

PRACTICAL electricians say that current from street railway wires should not be considered available for light or power purposes in any building. Insurance agents are shy of placing policies where such a dangerous practice is known to exist.

FORMULÆ for the preparation of flash-light powder for photographic purposes have been repeatedly published herein. The following, it is believed, has not been previously given: Magnesium, 40 parts; permanganate of potassium, 40 parts; peroxide of barium, 20 parts.

SINCE his return from the Transvaal, South Africa, Chas. Butters has put a great deal of personal effort into experimental cyanide work at Shasta, Cal., and Spencer, Utah, but says he is not yet ready to give out anything in the way of definite results. He is at present in London.

THE present effort of the California Anti-Debris Association in Nevada Co. is merely an effort to show cause for continuance of its attorney's salary. The California Debris Commission has sole and final federal authority, and was thus taken out of the local courts six years ago.

GRAPHITE, if very pure, is of commercial value as a lubricant for machinery, and of fine quality makes "lead pencils." It is nearly pure carbon. An interesting expert article on graphite written for this paper by the State Mineralogist of California, appeared in the issue of Feb. 4th, '99.

LIQUID AIR has been used for blasting purposes as an experiment by Linde of Munich, near Cologne, Germany, the trial being reported to be successful. Details are lacking, but Mr. Linde has gone to Switzerland, where the new method of blasting by liquid air is to be adopted in running the Simplon tunnel.

THE relation between one avoirdupois ton of 2000 pounds to one troy ounce is the same as that between one assay ton, 29.166 grams, and one milligram; so that if one assay ton of an ore sample is used in a gold assay the weight of the bead resulting therefrom in milligrams indicates the value in ounces per ton.

SOME Paris Exposition mining exhibit propositions take unique form, as, for instance, the Utah miners' scheme to furnish $345,000 gold for a life size statute of a favorite actress. The resultant advertisement to Utah and the actress would justify the fulfillment of the idea provided the gold could be definitely considered in the light of a loan.

ALL nitro-glycerine compounds freeze and become hard at about 42° F. A contrivance for thawing giant powder was described and illustrated in the issue of Dec. 24th, '98. An apparatus especially designed for such purpose is sold by dealers in mining machinery. Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., advertise such a device.

COLORADO advices are to the effect that above 8000 feet no snow has yet begun to melt. In some places over 40 feet of snow was reported. Traffic and general business has been resumed, and a big year is looked for. Throughout the California Sierras, generally, there was heavy snow. At the upper dam of the Tuolumne County Water Co. the depth was 12 feet, which, unless suddenly melted, should furnish abundance of water for the mines there long after the streams would have run dry. Like conditions are reported in Utah.

NOTICES are appearing in different California papers published in mining districts calling for miners' meetings to adopt the old mining district laws as to recording, etc., abrogated by the law of March 26th, '97, which was in turn repealed by the last California Legislature, thus permitting a reversion to the customs of the preceeding generation.

A NUMBER of grades recently made in hillsides on the sites of new mill or other mine buildings in California have been cut out by hydraulicking similar to the hydraulic mining method, the soil and loose debris being removed to bedrock. This has been done where the cost of preparation for the application of this method has not been too great.

IN a survey of mining claims upon which application for a United States patent is made, a surveyor may change his survey as marked on the land at any time before the return to the land office. But when an owner accepts a patent issued in conformity with the surveyor's return he waives all right to dispute the correctness of the boundaries as fixed by such return and the warrant.

TO FAIRLY and correctly state the relative advantages of roller mills and stamp mills would require an exhaustive treatise, and the conclusions would hardly be of general acceptance. The ore, its character, quality and amount; the locality and surrounding conditions go far toward determining which is best or more economical, and no general rule would apply to all local cases or requirements.

THE recent $5,000,000 organization of the North Star Mines Co. of Nevada Co., Cal., was, in connection with the North Star mine whose stock is to be listed in Boston, the same as Merced of Mariposa, Santa Ysabel of Tuolumne, and Pioneer of Placer, counties. Of the stock of the new New Jersey corporation $2,000,000 is to be exchanged for the North Star mine, and $500,000 offered to stockholders at $10 per share.

ELECTRIC currents have long been a disturbing element in observatories, it being found extremely difficult to separate in the record the variations produced by recorded changes in terrestrial magnetism from those caused by the trolley, and the former domain of the magnetic needle is seriously interfered with by the electric engineer. A correct and satisfactory solution of the problem presented has not as yet been reached.

CHLORINE and carbon dioxide have long since been liquefied—the former in its liquid form is used in the chlorination process in central California's leading gold producer, as narrated by that mine's superintendent in the issue of July 2nd, '98. All the elemental gases have been liquefied, even helium yielding to pressure, and the next advance in that direction may be the artificial production of solidified air, in blocks like any other inert mineral.

THE real economy of the electric motor does not lie in its ability to do any more work for each horse power than could be done by the steam engine, but in the fact that the power for many motors can be generated at one central station under conditions of much greater economy than can be secured in the locomotive or in small separate plants, and also in the greater efficiency, for special purposes, of a rotary motor over the reciprocating action of an ordinary steam engine.

A MINER was killed a few days since in the Norwegian mine in Tuolumne county, Cal., through the criminal practice of strapping timbers, lagging, etc., to the outside of the skip. The unfortunate man and a companion were near the bottom of the shaft when a plank which had been tied to the outside of a skip which was being lowered, becoming loosened, fell with the result stated. There is no excuse to justify this method of handling timbers or lumber in any mine.

ADMIRAL DEWEY'S "flag ship," the Olympia, is a "protected cruiser," 5800 tons, 340 feet long, 53 feet wide, with twin screws, each shaft driven by its own triple expansion engine. The normal coal supply is 400 tons. She was built by the Union Iron Works of San Francisco. The contract called for 13,500 H. P. On trial she developed 17,313. Her official trial speed is 21.68 knots. The total amount of power estimated as necessary for the Paris Exposition is 20,000 H. P., of which 15,000 is allotted for lighting and 5000 for motive power.

PRESIDENT MCKINLEY this week issued a proclamation setting apart 130,000 acres of land on the south side of Lake Tahoe, California, as a forestry reserve and public park. The proclamation defines the limits of Lake Tahoe forest reservation as follows: Townships 11, 12 and 13 north, range 16 east, Mount Diablo base and meridian, California; townships 11, 12 and 13 north, range 17 east, and south of township 11 north, range 18 east, as lies west of the Sierra Nevada range of mountains in El Dorado Co., Cal. Entries of lands already made are excepted from its reservation.

IN the case of Howeth vs. Sullinger, 45 Pacific Reporter, 840, the Supreme Court of California held that, "under the laws of the United States, Sec. 2324, which provides that the location of a mining claim must be distinctly marked on the ground, so that the boundaries can be easily traced, there is a sufficient identification of a lode claim where a stake or monument is placed at each corner, and at the center of each end, with one or more notices of location. It is immaterial that the lines and monuments of an official survey of a mining claim are not identical with those of the original location, the location being void only so far as it exceeds the statutory requirements."

A METHOD of depositing metals direct from the ore is reported from Germany, which is said to have proved so successful that a number of metallurgical works are to be equipped for this process of treating the ore. The process has been applied most for the refining of copper. The copper ore is first ground fine, then placed in a hot solution of copper chloride to dissolve the copper, silver, lead and nickel, and to change the solution to cuprous chloride. By the action of lime the arsenic, bismuth, antimony and iron are eliminated, and the solution, after being filtered, is passed into a receptacle divided by a diaphragm. Here electrolytic action occurs. The anode being carbon and the cathode copper, the copper of the solution is deposited in the cathode chamber, while the chlorine set free in the anode chamber combines with the solution to form cupric chloride, which serves to dissolve more of the copper ore. There is no loss of the solution, as the action is continuous. It is claimed for the process that the yield is far in excess of the usual methods, and that silver, lead and nickel are also obtained in a free state.

NO INFALLIBILITY is claimed for technical statements made herein, the idea being to attempt concise, correct answers to the great variety of questions asked. Where error is pointed out the mistake is cheerfully corrected, when manifest that a mistake was made. The exact technical nature of the information usually sought makes a high degree of exactness necessary for the answer to be of value, but at best and with the greatest care the result can only be approximately correct. Nor can answers be given immediately. It is always easier to ask questions than to answer them, and to properly answer an apparently easy question often takes considerable time.

NO PACIFIC COAST smelting company and no similar concern on the Atlantic coast is in the new smelter combine, which includes eighteen of the principal smelting companies in Illinois, Nebraska, Missouri, Texas, Colorado and Montana. It is understood that E. W. Nash is to be president, and S. B. Grant chief metallurgist, but this latter is not definite. It is stated that the policy of the combine will be to go slow as regarding the price paid miners for ores, looking rather to an advance price for the product. The total capacity of the combine is about 4500 tons daily. The main idea seems to be ability to fix the selling price of its product, and regulate the market itself, which is a comprehensive plan. The new arragements go into effect May 1.

MILL tailings at the Alaska-Treadwell mine average about 50 cents per ton. The concentrates are treated by the chlorination process, about 90% of the assay value being saved. Doubtless, as in other cases, a higher percentage might be saved, but where 90% is saved at a profit, it is more satisfactory from a commercial point of view than to lose money saving an extra 5%. There is no data to hand since the 520 new stamps began operations last month, but it is learned that during the preceeding ten years the mill crushed 2,536,013 tons ore, yielding $5,705,697.30 in free gold, and $2,183,170.64 in concentrates. During that time the average cost of mining and milling was $1.47 per ton, and, at times, the cost of milling was 30 cents per ton. During the ten years mentioned the aggregate profit was $4,167,154.99.

OF the 147,403 square feet of space allotted to the United States for display purposes at the Paris Exposition, 8000 square feet have been set apart for mines and mining, and 48,000 square feet to machinery and appliances allied to the mining industry. There are to be two distinct mining exhibits: one on the surface and one underground. The space above ground is for the display of mineral specimens and ore-separating machinery. Underneath the hill on which stands the Trocadero will be an exhibition of underground mining. What a revelation it would be to millions were such an exhibition of California hydraulic mining fitted up and shown as that which constituted so great an attraction at the Mechanics' Pavilion in San Francisco on the occasion of the Golden Jubilee and Mining Fair in February, '98!

POWDERED coal is utilized in the production of steam. Coal ground to pass through a 60-mesh screen is fed into a hopper in front of the furnace. At the bottom of this hopper is a grating which can be agitated 150 times a minute. The powdered coal drops through the grate into the bend of an air supply pipe which enters the furnace at the top of the furnace door. As it falls an induced draught carries it into the furnace which is lined with firebrick a length of 10 feet, and has two firebrick bridges. There is no grate and no fire doors, combustion being observed through two small apertures. Some Berlin experiments resulted as follows: The dry powdered coal evaporated from and at 212° 9.12 pounds of water per pound of dry coal as compared with 6.48 pounds solid coal fed by hand stoking. It is known as the Wegener system. It is figured that grinding the coal costs about 10% of its first value.

THE chief liability to explosion in a horizontal tubular boiler and any externally-fired shell boiler is from overheating of the shell, due to accumulation of mud, scale or grease on that portion of the shell lying directly over the fire, or a double thickness of iron with rivets, together with some scale, over the fire, or to low water uncovering and exposing an unriveted portion of the shell directly exposed to the hot gases. Vertical tubular boilers are, mostly, liable to explosion from deposit of mud, scale or grease upon the lower tube sheet, and from low water allowing the upper part of the tubes to get hot and cease to act as stays to the upper tube sheet. Locomotive boilers may explode from deposits on the crown sheet, from low water exposing the dry crown sheet to the hot gases, and from corrosion of the stay bolts. Double-cylinder boilers have exploded on account of the formation of a steam pocket on the upper portion of the lower drum, the steam being prevented from escaping from out of the rings of the drum by the lap-joint of the adjoining ring, thus making a layer of steam about one-fourth of an inch thick against the shell which was directly exposed to the hot gases. In the absence of details it is impossible to state the cause of the recent boiler explosion at Seattle, Wash.

HOW TO TEMPER and magnetize steel rods was the subject of a "Concentrate" in the issue of the 15th inst. Another method is to wind three or more layers of insulated copper wire around the full length of the steel to be magnetized, leaving two ends of the wire exposed, which are then connected with either two or more batteries or to a dynamo current. The latter is considered best, as it will magnetize in a shorter time. Care should be taken to have the steel thoroughly clean, free from rust, dirt and other substances which are liable to prevent the charge from entering the steel with its full capacity to obtain the very best results. The best results may be obtained by annealing and polishing a piece of cast steel before charging it. Certain specimens of magnetite surpass most kinds of steel in their capacity of retaining magnetism. Specimens of magnetite from Moravicza, in Siebenburgen, recently tested, have been shown to possess a greater degree of permanent magnetism than steel manufactured by the puddling, Bessemer or Siemens processes, but are surpassed in this respect by certain crucible steels and by tungsten steel, a Westphalian specimen of the latter showing a permanent magnetic moment of 62 units, as against 37 for "diamond steel," 34 for Reschicza crucible steel, 29 for Martin steel, 15 for puddling steel and only 3 for Bessemer steel. In 122 days a rod of magnetite only lost 1.5% of its permanent magnetism.

Some Characteristic Features of Veins in Granite in California.

Written for the MINING AND SCIENTIFIC PRESS.

Skirting the foothills of the Sierra Nevada mountains in California are three well recognized and distinct mineral zones or belts. These are known as the west or copper belt, the mother lode and the east lode. They are approximately ten to twelve miles apart, converging somewhat northward. The copper belt also contains gold mines, but the central and east lodes are chiefly gold-bearing, though copper ores also occur in a few places. The veins of the east lode traverse slates, mica schist, quartzite, limestone and other metamorphic rocks, and also occur in diorite and granite or, more properly, in grano-diorite, and it is more particularly to the latter occurrence that attention will be directed. Granite areas in which gold-bearing veins occur are found in Riverside county west of Perris, in Madera county near O'Neills, in Mariposa county near Hite's Cove, in Tuolumne county near Groveland, and at Summersville and vicinity, in Calaveras county at West Point and vicinity, in Amador county at Pioneer, in El Dorado county at several localities, and in Nevada county at and near Grass Valley and Nevada City.

In the several granitic areas referred to occur a large number of veins, some of which appear entirely independent of all others, and in other instances are found systems of connected fissures which were evidently produced by a common cause. These veins have definite characteristics, and the ores are noticeably similar throughout the entire granitic region referred to. They are usually easily distinguishable by their physical appearance from the ores occurring in other formations, whether in the same vicinity or from some distant point.

The strike and dip of these veins in granite are not at all uniform, in this respect differing greatly from the veins of the central belt which almost universally strike west of north and dip easterly. In the granite areas the veins have no uniform strike, but are found from true east and west courses around to north and at all angles between them. The dip is no more uniform than the strike. Whatever the direction of dip of a vein it is usually not persistent at or near any particular angle, but varies from a low angle to nearly or quite perpendicular. Not infrequently, in depth a vein will dip in an opposite direction from that at and near the surface.

The veins occur along lines of fissuring. These fissures are found singly, in pairs and in many places as zones of fracture of varying width, comprising several fissures having an approximate parallelism. These fissures, singly and in groups, are often planes of movement, as evidenced by slickensides, clay and gouge seams. In many cases these zones of fracture are found to consist of crushed granitic material, greatly altered, and in some instances containing vein quartz in a granulated condition, indicating that a movement of the rock masses has taken place subsequent to the deposition of the quartz. In certain more rare cases this brecciated or granulated quartz has been cemented by a still more recent infiltration of silica. In these crushed zones the feldspars are thoroughly kaolinized; the bi-silicates are altered to chloritic mineral and the whole mass is soft and, when wet, sometimes mushy, forming dangerous ground to mine. Often it is gold-bearing, too, though seldom rich.

In the same fissure plane or zone are found the concentrated mineral deposits forming the ore bodies proper of the mines. In some cases they lie at the side of these crushed, partially silicified zones, either in direct contact with them or separated by a rib or wedge of hard granite, but little altered. In other instances they are found as separate ore shoots, connected with the previously described crushed zones only by a clay seam. Other masses of quartz occur in these fissures which contain very little of either gold or sulphide mineral.

The veins are undoubtedly the result of substitution of silica, calcite and other minerals for the original soluble constituents of the granite, having been conveyed to the point of deposition by mineral solutions, probably derived from a deep-seated source. The most complete replacement has evidently occurred where the fissuring and crushing has been greatest. The vein quartz is found exhibiting every phase of condition from a partial alteration of the granitic mass, almost a normal granite (though the feldspars are always carious, and a small percentage of finely divided iron sulphide may usually be observed) through the various stages of transition, finally reaching the most complete alteration to crystalline quartz, sometimes heavily impregnated with the sulphides of iron, lead, copper, zinc and silver, with gold and other minerals more rare. Calcite is a frequent accompaniment, both in the quartz and in the crushed zones of granite. The vein quartz occurs in a variety of conditions—as a vitreous, colorless, granular rock; a milk-white, semi-greasy kind; a bluish-black variety, usually vitreous; also in alternating bands of bluish and white rock, and as granulated quartz. All of these varieties are gold-bearing and again all kinds are barren. All are associated with sulphide minerals and all again occur with scarcely a trace of them. The banded varieties are usually of fair grade in gold, and the appearance of galena is often an index of value. Some of the zinc ores are also high grade. The sulphide minerals contain from $50 to over $1000 per ton in gold and some are also correspondingly rich in silver, though the silver contents are usually relatively small. The sulphides are pyrite, marcasite, chalcopyrite, galena, blende and pyrrhotite. The latter is peculiarly characteristic of granite formations throughout California, particularly in the ore bodies of larger size. Tellurides of gold occur sparingly in several localities.

The ore shoots vary greatly in width and length and occur as lens-shaped masses, often of irregular form. Some of the shoots are several hundred feet in length and have a width of 30 feet or more, as in the Black Oak mine in Tuolumne county. Ordinarily, however, the shoots are less than 100 feet in length and average between 6 inches and 2 feet in width. Often the lenses have an average length of 20 feet, but succeed each other immediately, the ends often overlapping, thus forming practically a continuous shoot of considerable length.

Occasionally are found two veins approximately parallel and separated by 1 to 4 feet of granite in a more or less advanced condition of alteration, as is the case in the Good Hope mine, near Perris, in Riverside county. The branching tendency of the fissures is a pronounced characteristic. Usually one wall at least is well defined—generally the foot—the zone of fracture and crushing extending to various distances into the hanging wall. Now and then a perfectly defined hanging wall will be found, but progressing along this wall it is seen to diverge gradually from the plane of the foot and its influence as a bounding plane is lost, another slip or wall taking its place. This continues indefinitely until the identity of the entire vein is lost in the numerous branching cracks which extend into the granite. Often a well-defined vein several feet in width will thus pinch out to the merest crack in which is found no sign of clay or of movement, and it requires the most careful observation to follow it at all; but usually by persisting in the general direction of the course of the vein, it may be found to reopen and new shoots of ore found. Sometimes, however, after drifting fruitlessly some distance, a crosscut is advisable. In some instances these pinches are more than 100 feet long and the ground very hard.

The formation of many short shoots of rich ore in portions of the fissure where the walls are several feet apart is an interesting feature. It is not uncommon to find a wedge of quartz forming on the footwall, which gradually widens to 1 or 2 feet, when it leaves the footwall, crosses the fissured zone at a low angle and joins the hanging wall, where it thins out and is lost. Between the short shoot of ore thus formed and its parting from the footwall there may be found several stringers of quartz parallel with the foot, or the entire space may consist of a reticulated group of small veins and seams, while along the footwall a second wedge-shaped vein of quartz will appear which will repeat the peculiarities of the shoot adjoining, as described. The granite adjacent to the vein, and occurring as horses within it, is frequently gold-bearing to a considerable extent, sometimes in sufficient quantity to be visible to the eye.

It is the custom to sort out the granite as waste, but it should be done with caution, for it not infrequently pays to send the entire contents of the vein to mill, when in the pay shoot.

The fact that several old dumps have been worked at a profit is evidence that early methods were careless in this regard. In some respects these mines are worked at a disadvantage, for it is easy to lose the vein where a pinch occurs, and it has led in numerous cases to the closing of what are probably good mines. What has been described as occurring along the vein horizontally is equally applicable to the fissure in depth, and a pinch in the shaft does not signify that the limit of the vein has been reached any more than it does when occurring in the face of a drift.

These disadvantages are generally offset, however, by the high grade of ore, which is uniformly much higher grade than that in larger veins in other formations. Often the ores from the veins in granite may be shipped to distant smelters with profit after rough sorting.

Dykes are of frequent occurrence throughout the granite area in the neighborhood of the mineral belt. They are of various types, but the most common are granitic dykes of coarse crystallization and dark green diorites of fine grain, extremely tough and hard. The former are characterized by the occurrence of masses and crystals of albite, tourmaline and biotite. The peculiar interwoven, grate-like structure of quartz and feldspar, known as graphic granite, is of frequent occurrence. These granitic intrusions are usually older than the veins, though there are exceptions. The diorite dykes, however, are generally younger and cut the veins. The dykes, as a rule, cross the line of strike of the veins, though not always. Whether or not these dykes have any important influence on ore deposition is a question.

In some instances ore shoots are found lying with the granitic dykes, the downward pitch of the ore body being coincident with the dip of the dyke. The influx of large quantities of water is a usual accompaniment of the development of these veins. It often comes with a rush at unexpected times. A mine may be developed to considerable depth and have encountered but little water, when without warning a blast will break into what is called by the miners a reservoir or pocket, though usually, in fact, a system of fissures filled with water derived from the surface. The deeper the point in the mine at which these water crevices are struck the greater the force of the water. Often the lower levels are completely flooded, and weeks are required to pump out the water, but in time the reservoir is exhausted and things resume their usual condition. Another water rush may not occur in many months, and again in some cases they have been found in quick succession. In one instance a water crevice was broken into in the Black Oak mine in Tuolumne county at a depth of 600 feet. With considerable difficulty a bulkhead was constructed and the pressure gauge indicated at one time a standing pressure of 180 pounds to the square inch, indicating that the height of this reservoir was not less than 400 feet. The flow being controlled by means of a valve, the pumps in time removed the water and a normal condition was again reached. After several months the bulkhead was torn out and a round of holes was drilled in the face and discharged, upon which the water again rushed into the mine workings in as great volume as before.

The probability is that in some manner the vent to the reservoir had become clogged and the flow of water stopped. The force of the blast removed the obstruction and the water again poured into the mine workings, but it finally was drained to a considerable extent. This shows the necessity for an abundant capacity to handle water. Some claim that large flows of water are an indication of valuable ore deposits, but there is really no apparent relation between ore deposits and large flows of water. The ore was deposited by ascending currents and the water found in mines is always found coming down from the direction of the surface. Sometimes water may be seen bubbling up from the lowest levels of a mine as though from an ascending current, but a case of this kind is due to hydrostatic pressure, the water flowing in coming from some point higher, through a series of connected cracks or fissures.

A peculiarity of these veins in granite near the surface may often be observed in the occurrence of open cracks, traversing the vein in a horizontal direction, reaching from wall to wall, and dividing the vein into blocks by a series of floors, as it were, at quite regular intervals of a foot or thereabouts, depending somewhat upon the width of the vein. The blocks are separated by 1 to 4 inches of space, in which have accumulated clay and grit, quartz crystals, iron oxide and other secondary products and gold. The amount of gold is often largely in excess of the amount found in an equal weight of quartz of the vein itself. This peculiar occurrence is undoubtedly due to a sort of molecular expansion of the granitic mass, chiefly due to the alteration of the feldspars, and in a less degree possibly to the change which has taken place in the other constituents of the granite caused by surface decay and meteoric agencies generally. It is an interesting fact, and affords food for study and investigation.

The occurrence of gold in the silt-like material lying on these floors may be due partly to the quartz itself, but more probably comes from the oxidized sulphides and also in part perhaps by infiltration from the selvages of the vein, if not from the granite itself, which may have become gold-bearing by impregnation from the fissure. Attrition, due to movement, may also have been partly responsible for the occurrence of this gold. When the oxidized zone is passed and the granite becomes normal these floors no longer appear.

In many places the quartz is perfectly free from both walls, and again but one wall is free, the opposite side being frozen. In an equal number of cases the vein is frozen on both walls. These variations are not constant, for a vein may be free at one place and frozen in another. These changing conditions may be considered as indicating something of the relation of the original fissure to the ore deposit. Where both walls are free, it is not unlikely that the ore is filling the space bounded between two fissures. Where one wall is free the mineralization has progressed along one side of a fissure plane only; and where both walls are frozen, it would seem to indicate that ore deposition progressed outward from a single crack, or possibly, in the case of a large ore body, the mineralization has impregnated the walls beyond the limiting planes of the fissured zone, to an extent sufficient to constitute ore and has stopped only when the mineral solutions were unable to penetrate farther from the fissure plane itself.

W. H. S.

EVERY commercial and manufacturing industry is either directly or indirectly dependent upon mining in some form or other. Even those which seemingly are the farthest removed will, at a moment's thought, be seen to depend upon the mines for existence, whether it be for coal, iron or some of the base metals, or for gold or silver.

Some Experiences of a Working Miner.

NUMBER X.

Written for the MINING AND SCIENTIFIC PRESS.

Some men have queer ideas of the eternal fitness of things. Now, there was S—— up at A——. He owned several mining claims, and had a little money. He also had friends, and he organized a corporation to equip and develop his mines near A——. There were several veins on the various claims, but they were not all alike. Some were free milling and some not. Of course the proper thing to do was to first develop the mines, and this was done to a considerable extent. Shafts were sunk on several veins and numerous tunnels run. The workings demonstrated that they were good, strong veins and that these veins carried gold. The free gold vein was the one to which attention was first directed, but this seemed too easy, too much like following a deep rut in the road. So it was determined to make an effort to treat the base ore, which was higher grade. The first attempt failed, but S——, being full of determination and confident in his own ability to successfully treat this stubborn ore, stuck to the proposition. He rebuilt his mill several times, substituting various new devices for those previously tried, but always with the same discouraging result, until at length the resources of the company were exhausted and they either could not or would not put up another dollar. At this late hour S—— turned to the free milling vein again and tried to convince his company that he could soon recover his losses if they would allow him to try that proposition, but they decided unanimously that S—— and his mines were frauds, and left him to struggle alone. He is there yet and so are the mines. Here and there, lying about, are old, rusty iron castings of odd shapes, the original use of which it would be hard to guess, but no one goes near the mines—they have been effectually queered by a man who lacked the first requisite in mining success—common sense.

Miners do not always recognize a good thing when they see one. Some years ago two energetic prospectors located a claim and drove a tunnel into the hill on a small vein. The vein carried a nice prospect in free gold but it was far from being rich, considering its size; still they stuck to it and worked every day. After a while they struck water, and as the face of the tunnel advanced the flow of water increased until they had quite a stream flowing out of the tunnel. One day they struck a crevice in the rocks and the water more than doubled in volume. As this was not a dry country by any means, and as water flowed down the gulch in front of their cabin they did not need nor want this water, so when the superintendent of a large mine several miles away came riding by, they engaged him in conversation and showed him some "average" prospects carefully saved during the course of development. The manager of the great corporation appeared much interested in this little mine, but hesitated about going into the tunnel on account of the water, as he didn't like to get his feet wet; but they quickly provided a pair of rubber boots and he made an examination lasting nearly half an hour. He took a few samples from the dump and told the boys to come down to the H—— mine almost any day, and he would decide what to do after thoroughly testing the ore. They went down the following day, and the assays not having been finished they were obliged to wait until the following day, when, after considerable bargaining, the price was agreed upon, and the transfer was made. The miners were jubilant, and proceeded to celebrate the event in proper mining-camp style, and incidentally let it drop that the manager of the big mine was pretty easy game. After they had celebrated to a satisfactory extent they returned to their camp, but imagine their surprise to see a number of men working on a new flume which led them up the gulch toward their camp and finally stopped at their tunnel, across the mouth of which a strong bulkhead had been constructed. Then for the first time they realized that they had underestimated the caliber of the manager—it was water for the big mines he wanted and not the little vein at all. Had they realized its value they could have easily gotten ten times the amount which they had received. They thought it would be a good scheme to repeat the experiment and accordingly drove another tunnel, in which they got neither gold nor water.

One of the biggest humbugs in mining camps is the wet process and blowpipe assayer. The volumetric assay of many ores is a splendid process and is absolutely dependable when properly made, and the blowpipe in proper hands is also worthy of every consideration and is reliable in its results, but it is not to this class of chemists I refer, but to another class of men entirely. To illustrate, I knew one of these impostors at D——, his name was B——. A prospector would bring in a piece of rock and B—— would proceed to examine it critically under a magnifying glass. Then, after a few appropriate remarks, such as "This is from the Archo-cretaceous," or from the "Cambreo-tertiary," he would go on and at length explain to the astonished prospector the genesis of this particular rock and finally tell him it was gold or silver ore, or some other ore, and he would assay it for $1. This was quite an inducement, as the regular price for assaying by competent assayers was $3 50. B—— would pulverize the ore, boil it with nitric acid, add salt, and borax, and then bi-carbonate of soda. A brisk effervescence followed, after which the solution was decanted, the pulp washed and dried and treated with the blowpipe. The next process was washing (vanning) down in a little porcelain saucer until the specks remaining were so small no one could tell what they were without the aid of a microscope. This old fraud would then dry and pretend to weigh the "buttons," and would gravely announce the value of the ore to be $187.42 gold, 317.76 ounces silver and anything else he happened to think of, and would hand his dupe a printed slip purporting to be a certificate of assay. He took in hundreds of dollars in this way from unsophisticated prospectors. On one occasion I took him a piece of white friable quartzite in which could be seen a multitude of dark colored specks. These were chloride of silver. A similar sample of ore assayed 1800 ounces silver. B—— examined it in the usual way and said in such a patronizing way, "My friend—common sandstone, a waste of money to assay it." "What are those black specks?" I inquired. "They," said B——, seriously and as I thought, pityingly, "are fly specks, my friend." I could do no less than thank him, and, putting my $1800 fly specks in my pocket, walked out. I have known of other pretenders no more reliable than B——, who had a pretty good outfit of furnaces, scales, etc., but knew practically nothing of their use.

I walked up to a prospect shaft on the P—— Q—— mine one day. It was about 80 feet deep. Two men were windlassing. As the bucket approached the surface I watched them land it on the platform. I have seen many devices for attaching a rope to a bucket about mines—plain hooks, safety hooks and other hooks, including the outrageous "pig-tail" variety—but these fellows had the latest scheme. They had made a loop about a foot long at the end of the rope. This loop they passed through the ring in the bail, then turning the end upward the upper portion of the loop was drawn through the lower portion and a piece of stick 8 inches long and 1½ inches thick thrust through to hold it. To me it seemed a very dangerous thing to work under, and I promptly declined an invitation to go down the shaft. I told them I considered their device dangerous but they assured me of its perfect safety and also enlarged upon its convenience. One of them called down the shaft to "Scotty," who was at work in the bottom, that a stranger was afraid to come down on account of the loop. This amused Scotty greatly. Within two weeks this same bucket fell from a point near the surface and Scotty's mining days were over. The poor fellow was killed instantly. How it happened no one seemed to know, but I am satisfied as to how it occurred. MINER.

Marconi's Wireless Telegraphy System.

In the issue of Jan. 8th, '98, the latest in "wireless telegraphy" was given. Since then there has been further advance, some of which is embodied in a recent address by M. Marconi, from which it appears that the best results are secured when the signaling circuits at the terminal stations are connected to vertical conductors, the lower ends of these being earthed. The addition of a capacity, such as a hollow metallic box or sphere, at the tops of the vertical circuits assists the working of the apparatus. Regarding the height of the poles on which these vertical circuits are mounted, it has been found that

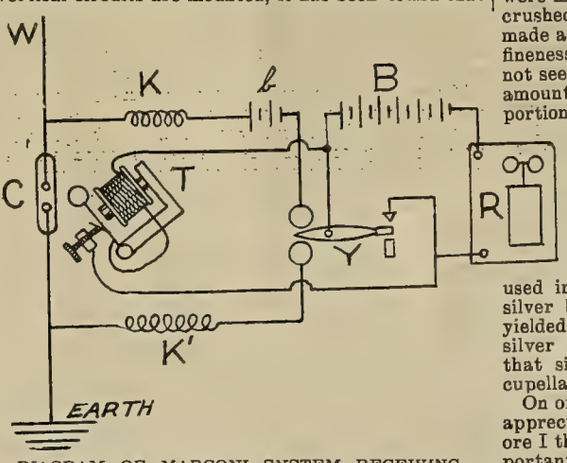

DIAGRAM OF MARCONI SYSTEM RECEIVING STATION.

with poles 20 feet high messages may be successfully transmitted to a distance of one mile. Poles 40 feet high are sufficient for four-mile transmissions, and in general the distance to which a message may be sent varies as the square of the vertical height of the terminal circuits. Over land the distances practicable are not so great as when signals are sent over a water surface, though the effect of intervening hills, trees, houses, etc., is lessened when high poles carrying the sending and receiving circuits are employed. As to the arrangement of the apparatus, M. Marconi found that, for a sending station, a coil giving about a 10-inch spark is best, the discharge taking place between brass balls 1 inch in diameter. This arrangement, when the balls are only about ⅝-inch apart, gives better results than the Righi oscillator formerly used. It is said to work better when the balls are dull than when they are polished. The object of using so large a coil for this short-spark distance is to insure a regular and steady stream of sparks.

The arrangement of a receiving station is shown in the accompanying diagram. The coherer *C* is connected with the vertical wire *W* and also to a small battery *b*. Included in the circuit with this battery and the coherer are small working coils *K* and K^1, which compel the rapidly oscillating currents set up in the vertical wire to travel through the coherer rather than through the alternative path presented by the battery circuit and sensitive relay *Y*. The signals actuate the relay, which closes the large battery *B*, through a Morse recorder *R* and a tapper *T*, similar to an ordinary electric bell. This rapidly taps the coherer tube, loosening the filings contained in it, but this action is so rapid that the tongue of the relay does not have time to move, and hence the recorder makes a continuous mark while the wave signals are coming in. To avoid the disturbances that would be set up in the coherer by sparks at the tapper contact and elsewhere through the instruments, high-resistance, non-conductive shunts (not shown in the cut) are bridged around each gap.

The latest feat is the successful interchange of messages between Dover, England, and Boulogne, France, a distance of thirty-two miles, on the 28th ult.; the rate of transmission was about fifteen words per minute. It has been urged that Marconi can do nothing commercially with the system, because the transmission of messages is too slow for public requirements, and also because it is impossible to maintain absolute secrecy. Any one possessing an apparatus can receive the message destined for another person.

Loss of Gold by Absorption in Cupellation.

TO THE EDITOR:—I have recently been making some tests to determine the loss of gold by absorption into cupels during cupellation. Thinking that the fact of there being such a loss might be new and interesting to some of the readers of the MINING AND SCIENTIFIC PRESS, I send you the following results of my experiments:

I frequently have assays to make of chips from gold bars, and having no bullion rolls I beat my cornets out on a small steel anvil with a light hammer. This almost invariably leaves a slight discoloration of iron on the cornets, which is not removed by the subsequent boiling in acid during parting.

Thinking that this might be removed by cupellation, I rolled some of my weighed cornets in sheet lead and recupelled them. On weighing the purified beads, I found that they had lost about three-thousandths in the operation of cupelling. As this loss seemed excessive, I recupelled some of the beads several times and found that there was a constant loss of weight with each repetition of the process. I then pulverized and assayed some of the cupels, and found that I could recover about 98½% of the lost gold.

Concluding that the bone-ash of which the cupels were made was of too coarse and porous a texture, I crushed some of it to pass a No. 120 mesh sieve and made a few cupels for experimental purposes. The fineness of the bone-ash or texture of the cupels does not seem to make any particular difference in the amount of gold absorbed, which seems to be in proportion to the quantity of lead and richness of the alloy. Thus 500 milligrams fine gold cupelled with 20 grams lead lost 1.15 milligrams gold; 1000 milligrams fine gold cupelled at the same time with an equal quantity of lead lost 2.3 milligrams gold, while a third test of 500 milligrams of gold with 5 grams of lead only lost .54 milligram in weight.

An assay made of a cupel that had been used in refining a few pennyweights of gold and silver bullion of about 700 points fineness in gold yielded by crucible assay at the rate of 22 4 ounces silver and 6 6 ounces gold per ton, thus showing that silver is absorbed far in excess of gold during cupellation.

On ordinary low-grade ore assays the loss is not appreciable, but on large shipments of high-grade ore I think an assay of the cupels would be very important.

The absorption of gold in my cupels may be due to some chemical defect in the bone-ash.

If any of your readers have ever experienced a similar difficulty and can suggest a remedy, I will be glad to hear from them.

W. E. DARROW, M. E.

Sonora, Cal., April 7th, '99.

Electric Street Lighting.*

By ALBERT SHEIBLE.

Street lighting, as a whole, had become quite common for large cities before the event of electric lighting practice; indeed, Pompeii had its street lamps, and even the use of gas for street lights dates back almost to the time when Davy discovered the electric arc. Paris was lighted with gas as early as 1817, while Berlin and Dresden followed nine and ten years later, so that the extended street lighting of large cities from a central point had passed the experimental period more than half a century before the days of electric lighting. What is more, our larger cities twenty years ago seemed to be well aware of the two prime objects of street lighting, namely: path finding and crime preventing.

But it was the arc lamp that came first here and the Jablochkoff candle in Europe. Both of these were lamps of high candle power, and in admiring their great brilliancy most people forgot the formerly well-known objects of street lighting. Wherever the arc lamp or the Jablochkoff candle was shown the high candle power made the old gas or naphtha lamps seem very dim and ineffective; hence the cry went up immediately for electric street lamps—powerful street lamps, dazzling street lamps. Mr. Brush himself likes to tell of the first electric street lighting in this country, when a dozen tower lamps were placed on the public square at Cleveland, and when many in the crowds that gathered brought dark spectacles with them. It was not so much the illumination that they were watching for, but rather the dazzle and the glare; and once having seen these dazzling lights and noted the intense illumination near them the people were not satisfied with anything less brilliant, so that high candle power of lighting units became a requisite of lamps for street lighting.

As for the lamps themselves, electric street lighting has, for the most part, been done with just the same types of arc lamps that have been used indoors, the works of the arc lamp being somewhat protected from the weather by means of a sheet iron hood over it. Only within the last half dozen years have there been lamps with a proper weatherproof casing so as not to need this hood. The so-called 2000 candle power (460-watt) and 1200 candle power (300-watt) arc lamps are used almost entirely, though here and there we find some smaller sizes, which I believe will be used more largely in the future. The term "2000 candle power" in itself impressed the people in the towns lighted as something worth having, and if they happened to find out that the lamps really gave only about a quarter of this candle power the electric light men had no difficulty in convincing them that "the 2000 candle power lamp is one which sends 500 candle power in each of four directions from its place over the street crossing." Incandescent lamps have been most commonly used in the 25, 30 and 32 candle power sizes, with a few of 50 or 75 candle power, and some of only 16 or 20 candles. However, the distribution of the light from these lamps has almost always been aided by the reflector over them, which is not the case with the arc lamps.

As a distribution system, the series circuit still holds almost a monopoly for street lighting. It lends itself so readily to the connecting of lamps scattered over a large territory that it was used with the Brush arc lamps just as soon as the differential winding made the operation of arcs in series a possibility. The number of lamps on a circuit and consequent voltage was limited only by the ability of the dynamo builders to properly insulate the parts of their machine. Eighteen years ago a circuit of 16 or 18 arcs was a high voltage circuit, although the lamps then used were the so-called short arcs, requiring only 25 to 30 volts each. Bare copper wire was used at that time, but sad experience with it led to the "underwriters" and later to the so-called "weatherpoof" wire, which is still used almost exclusively except for wires leading into the casing of weatherproof arc lamps, for which purpose rubber-covered wires are now preferred.

The size of the dynamos was at first larger in Europe than in America, as the forty-eight Jablochkoff candles installed twenty-one years ago in the Place de l'Opera at Paris were run on multiple circuits from three alternators (each with its own exciter), driven by three 20 H. P. engines. This meant sixteen lamps per generator, while the earliest Brush arc dynamos built at about the same time were made for a single arc lamp, and the two-light and four-light machines which followed them had the lamps in multiple. Then when the series lamp was perfected, circuits of twelve to eighteen lamps became common, and dynamos increased in size up to the so-called 60-light or 50-kilowatt type, which for years has been the accepted unit. However, the development of much larger constant-potential generators and the evident increase in efficiency with the larger sizes stimulated the builders until now we have arc machines supplying as many as 150 of the 2000 candle power lamps or 200 of the 1200 candle power. Some of these are so arranged that the lamps, while all in series, are distributed over three circuits, so that the voltage on any one circuit is only about a third of the total. Meanwhile there have been great improvements in the alternating current arc lamps, and the perfection of such lamps for use on series circuits seems close at hand. When it comes we shall be able to run both our arcs and incandescents from the same machine, so as to use the 200 or even 500-kilowatt generators (which already have reached such high efficiency) without needing the rectifiers now used to some extent in England for supplying current from alternators to arc lamps in series.

Incandescents for street lighting are usually connected in series across the primaries on the alternating generator, each lamp being provided with a suitable cutout device to automatically close the circuit when the filament gives out. An exception to this is the Westinghouse plan of having an inductive or so-called "kicking" coil in shunt with the lamp, the coil being of too high resistance to consume much current ordinarily, but which will offer an inductive counter electro-motive force equal to the voltage of the lamp when the latter gives out.

The method of supporting the lamps varies from place to place, and, as a rule, has not had the proper amount of thoughtful attention paid to it. In the early days, when the number of arc lamps used was very small, these were put up on tall masts or towers, and were supposed to light a wide area. Such towers are still in use altogether at a number of places, and have also been retained in parts of other towns. They have the great advantage that they hold the lamp high enough not to glare into your eyes when walking toward them, but tall trees or buildings of any considerable height usually interfere with the distribution of light from them. Such towers generally had from two to six arc lamps each, and the next step was the placing of each of these lamps over a tall pole, so that the lamps could be distributed over the area to be lighted. The poles, being set inside the curbing, brought the lamp so close to the line of the shade trees as to cut off most of the light from the walk on the nearer side. To overcome this, lamps were hung out at the end of iron mast-arms, these being 10, 12, 15, or even 20 feet long, and, as a cheaper substitute, the cross-suspension wire method was then introduced, though mast-arms can now be put up as cheaply as the cross-suspension. Each of these methods has given good average results.

For a wide distribution of light from a lamp the latter ought not to be less than 30 feet above the street, hence the mast-arms or cross-suspensions were at first made to support the lamp over the center of the street and some 30 or 35 feet high. This brought the lamp above the foliage which shaded and darkened the walks; so that the lamps were lowered to the common height of only 18 or 20 feet, bringing them so nearly on a level with the eyes of the teamsters as to seriously dazzle them when driving toward the lamp. Reducing the candle power of the lamp reduces the intensity of this glare, so that a 340-watt or 240-watt is less offensive than the 460-watt arc, and a 105-watt incandescent lamp still less so. (The energy required for the 460-watt arc will supply four or five incandescents scattered like our gas lamps, to give a more even distribution for lighting units.) Happily, the enclosing globes used on long-burning arcs are reducing the glare, and the same is true when ground, opal or fluted globes are used.

To sum up the changes in street lighting practice: Yesterday the cry was for large lamps and intensely bright illumination of some picked spots, regardless of the equally intense shadows intervening. To-day there is the tendency to have the rays of light overlap and to use lower candle-power lamps in the alleyways and other dark nooks and on the streets of the outlying districts. To-morrow we may look for smaller units and a great many more of them.

Yesterday the type of lamp and method of support, picked for the business district, was used throughout. To-day many towns use the bright display lighting only in the business section and a milder one for the residence portion. To-morrow we may look for a mild but uniform illumination, both for the residence district and for the business portion after midnight.

Yesterday the lower efficiency of the incandescent lamp kept it back. To-day our ability to distribute light more uniformly with the incandescents has caused them to be used in many places, and to-morrow we may look for small arcs or incandescents of higher temperature and, therefore, higher efficiency to bridge the gap.

Yesterday the naked arc, being all the more dazzling, was welcome. To-day enclosing globes are mellowing the effect on the eye. To-morrow the use of naked arcs out of doors and less than say 30 feet above the ground ought to be prohibited by law.

Yesterday only large cities felt the need of street lighting. To-day even towns with a population of less than 1000 have their streets electrically lighted.

Yesterday a thousand towns secured the advantages of electric light and power by giving lighting contracts at a fair profit to proposed plants. To-day the same towns begrudge the help they have given toward modernizing their city, hesitate to pay even the actual cost for lighting by contract, and make the central stations look to the sale of exhaust steam and like sources of extra revenue.

Yesterday towns were lighted either with arcs or incandescents. To-day both are used in the same city, each in its proper place. To-morrow we may have some lamps of intermediate candle power to supplement the arcs and incandescents.

Yesterday every circuit of one dozen or two dozen arc lamps required its own generator. To-day we have from 100 to 200 run from a single generator, and to-morrow we may have 400 or 500 arcs, all run from the same alternator.

Yesterday a circuit of 1000 volts was hard to insulate, and might have to be shut down during rainstorms. To-day we have circuits of 7000 to 8000 volts giving uninterrupted service, in spite of wind and weather.

Yesterday little attention was paid to the fittings as long as the lamps, dynamos and circuits were all right. To-day they must be firm and durable. To-morrow the lamps, supporting fixtures and all parts of the circuit will need to be good-looking.

Last, but not least, electric street lighting has become an object of careful study and is receiving skilled attention. Yesterday the size and distribution of lamps and the methods of supporting them were decided chiefly by the salesmen of the firms supplying the material. To-day such organizations as the American Society for Municipal Improvements and the National Association of Municipal Electricians are making a serious study of street lighting in its general bearings and are getting back to due consideration of the prime objects of all street lighting—path finding and crime preventing. What is more, while some manufacturers and consulting engineers have made a specialty of long-distance power transmission, others of the lighting system for modern buildings, and still others of the applications of electric motors to special classes of machinery, we also have some who have been studying the problems of electric street lighting. It is only by such special study, both on the part of the engineers in charge of the work and of the makers of the needed devices, that we can expect to raise the present standard of effectiveness of our street lighting. And I think it is high time that both the general public and our electrical fraternity were made aware of the importance of these problems, so as to help us all in having electricity become by far the best means for properly lighting our outdoor pathways.

*Condensed from a paper read before the Chicago Electrical Association, March 10th, '99.

A Necessity to the Mining World.

The San Francisco MINING AND SCIENTIFIC PRESS is without a peer among journals of its class. * * * People who desire to keep in touch with all that is latest and up-to-date in mining and milling cannot afford to be without the MINING AND SCIENTIFIC PRESS.—Telluride, Colo., Journal, April 15th, '99.

A SOMEWHAT curious action was recently decided in the law courts. The plaintiffs agreed to give the defendants the benefit of what they claimed to be a "secret process" for casting copper, and brought an action against them for payments in connection therewith. The defense was that the plaintiffs had no "secret process" at all; and on their combating this allegation they were challenged to produce the "secret process" in open court. The argument of the defense, which was to the effect that the "secret process" if once disclosed would be secret no longer, appears a legitimate one. But, nevertheless, they were called on to disclose it, and, on their refusal, the case was adjudged against them.—Industries and Iron.

ACCORDING to the census of 1890 the entire capital then employed in the manufacturing and mechanical industries in the United States was $6,525,000,000. According to the New York *Journal of Commerce*, which has been at pains to bring together and add up the capitalization of the trusts and combinations now in the field, there has been created a stock and bonded indebtedness on their account of $5,832,882,842.

ELECTRO MAGNETS are to be used for recovering a large load of steel rails which was sunk in the Ohio river some time since. A crane boat will be equipped by a Pittsburg company with the necessary magnets and other machinery capable of lifting 4000 pounds each. The work will be done by a Pittsburg company.

THE battleship Iowa will leave San Francisco for Port Orchard, Wash., next month. It is interesting to note that the Iowa is to be repaired by the builders of the Oregon. The Oregon's great trip to Cuba and her present trip to Manila, in face of the failure of the Iowa to accompany her, is also interesting.

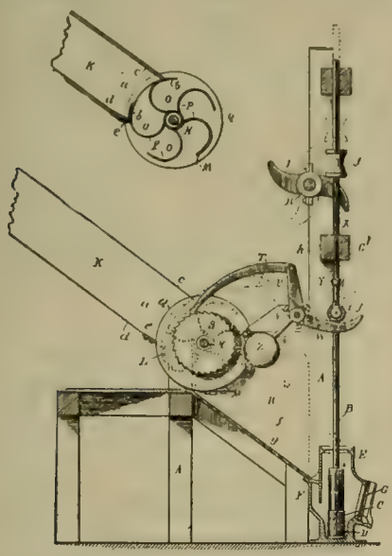
THE Supreme Court of California has rendered a decision upholding the right of labor organizations to boycott obnoxious employers, and denying an injunction except upon a showing of specific acts of a criminal nature.

Latest Mining and Metallurgical Patents.

Patents Issued April 4, 1899.

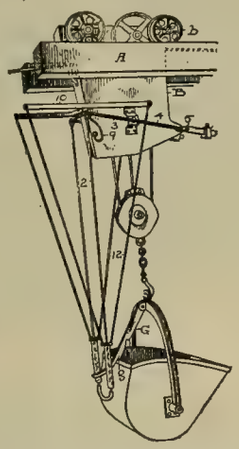
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE FEEDER FOR STAMP BATTERIES.—No. 622,763; C. M. Dobson and T. S. Alexander, New York, N. Y.



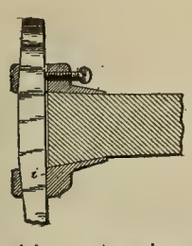
A revolving ore feeder, in combination with a bumper rod adapted to be operated by an ore stamp, a lever operated by rod connection between lever and feeder for operating the latter from the lever and means for restoring the lever and bumper rod, lever and rod having the one a cam face and the other a reciprocal face engaging and traveling on cam face, for graduating the speed of movement of the lever relatively to the speed of movement of the rod. A drum, in combination with a shaft *V* having arms *U* and *W*, a cam face *j* on arm *W*, a ratchet *S* on drum, a pawl *T* connected to arm *U* for operating ratchet, a bumper rod *X* adapted to be operated by an ore stamp, and in operative engagement with the cam face on arm *W*, and an adjustable stop *Y* for rod.

MEANS FOR TRIPPING BUCKETS.—No. 622,840; L. A. Cook, Conneaut, Ohio.



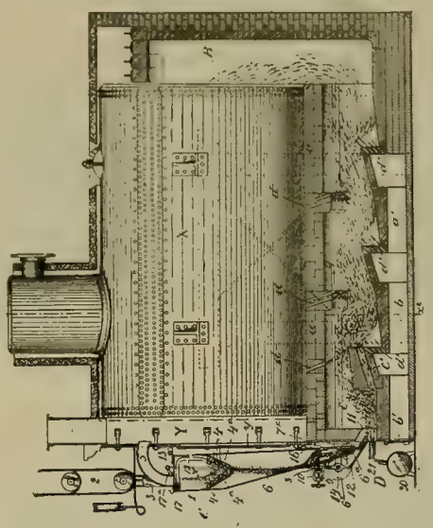
In a hoisting and conveying machine, a carrier and a bucket operated and suspended through carrier, a latch for bucket, in combination with a balancing bar pivoted to carrier and having a suspending member to engage latch, a counterweight to balance bar and member to prevent a premature tripping of the latch when the bucket is traveling or first lowered, and means to limit the free movement of bar and member to finally trip the latch.

MINER'S PICK.—No. 623,025; J. B. Lucas, Valley Springs, Cal.



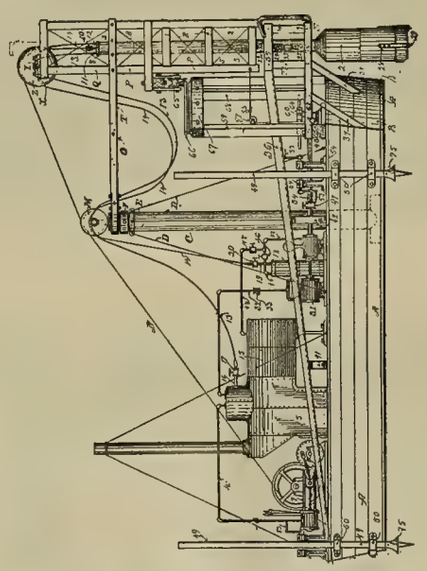
A pick, comprising a tapering eliptical socket provided with straps or loops projecting outwardly beyond the mouth thereof, each strap having a flaring passage formed by beveling the inner face of its outer wall, one of the straps having its inner wall extended to form a seat or projection which contracts its passage with respect to the passage of the other strap, a pick blade adapted to be inserted and withdrawn through the larger passage of the latter strap and provided with shoulders to abut against the beveled outer walls of the straps, a set-screw working in a threaded opening in the inner wall of the larger strap and impinging against the blade to force the same against the beveled outer wall of the strap, and a handle having a wedge-shaped butt inclosed in the socket and terminating in rear of the blade.

MEANS FOR FEEDING AND BURNING PULVERIZED FUEL.—No. 622,935; W. Westlake, New York, N. Y.



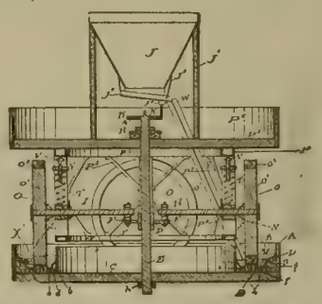
The combination with fuel receiver and chute or trunk 6 extending down therefrom, of a feed regulator consisting of a scolloped plate 7, in the chute or trunk, and movable plate 8, which may be shifted in or out over the plate 7, to regulate the size of the opening through which the fuel must pass in its descent to the furnace mouth. A fuel feeding and drying device, comprising a receiver 1, a V-shaped drier therein consisting of the steam pipes 4, and the plates 4^a situated beneath and near to said pipes, the agitator in said receiver above the drier, and chute 6 adapted to lead the powdered fuel by gravity down to the furnace mouth, and the feed regulator in chute.

DREDGE.—No. 623,111; A. J. Severance, Denver, Colo.



The combination in a dredge of a vacuum suction lift tube consisting of a tube containing a long body portion containing an enlarged suction or mouth portion, water and steam flexible supply pipes, steam and compressed water supplies, air inlet, a door hinged to mouth to swing both in and out and arranged to fold upon itself in either direction at substantially its width, and one or more self-closing valves adjacent to the mouth end of tube, spring keepers arranged to support door across the mouth of the tube positioned on opposite sides of tube to engage the parts of door at their pivotal hinge, an inverted lip or toe on keeper arranged to support the free end of door across the mouth of tube, being, altogether a dredge for raising gold-bearing gravel from the bottoms of rivers, comprising a vacuum suction lifting tube, having a door at its suction mouth and adapted to swing both inward and outward, means for locking door across mouth, tube having its upper end closed, a supply of steam arranged to be fed at will into the top portion of tube, a perforated diaphragm in the top portion of tube, a supply of water under pressure arranged to be delivered to the top of tube above diaphragm, an air inlet valve on tube, one or more self-opening and self-closing valves near the lower end of tube, and suitable means, including a supporting boat, steam generating, hoisting and pumping machinery, and supporting and operating mechanism for operating vacuum suction lifting tube.

ORE-CRUSHING MACHINE.—No. 623,088; C. C. Lane, Los Angeles, Cal.



A combination of the circular pan *A*; dies *B* resting on the bottom of pan *A*; the central vertical shaft *E*; the removable circular plate *F* formed with slots *F'* movably mounted on the shaft *E*; ring *P'*; standards P^4 mounted on ring *P'*; actuating drum P^6; swiveled journal boxes *N* movably mounted in standards P^4; spring *T* mounted between standards P^4 over journal boxes *N*; screws *V* with threaded screw-followers *V'*, the followers slidably mounted in standards P^4 over springs *T*; shafts *I* mounted in journal boxes *N* and having the bearings for their inner ends laterally adjustable in the slots *F'* and the edge-runners or crushing rolls *O* mounted upon shaft *I*.

BLASTING POWDER.—No. 622,990; H. Boyd, Tamworth, England.

A fumeless explosive, consisting of a mixture of nitrate of soda, sulphur, picrate of ammonia, bichromate of potash, peat dust, lime, and cotton-seed oil.

A New Smokeless Powder.

Ansil Moffatt of Indianapolis, Ind., is said to have perfected a new smokeless powder, the secret of which he and his friend J. R. Francis have kept quiet for a long time. For nearly four years Mr. Moffatt has worked at his laboratory and in the field with his new explosive, and as a result of the outcome as well as the tests made according to the government regulations, a company was incorporated with a capital stock of $150,000 to engage in the manufacture. Ansil Moffatt, inventor of the new explosive, says: "I have confidence in its immediate success. Its chief characteristics are safety of manufacture and use. All the extreme dangers of powder are eliminated by this process, and explosions of powder will be a thing of the past. It is a wet process, and the finished powder may be stored in water indefinitely without deterioration. It has stood all of the usual government tests. It makes the least smoke of all the smokeless powders. By comparative tests it shows wonderful projectile power, yet, owing to its peculiar nature, it may be used in a shotgun with the same safety as black powder. Less than one-half the quantity in weight is necessary for a load. One feature is that it can be used in all the old style gun shells. Our explosive will start a new era in mining. When exploded in a mine it leaves so little smoke, and absolutely no poisonous fumes, that the miner is enabled to immediately resume work. Thus from 15% to 25% of mining time will be saved. 'Azo' contains no nitro-glycerine, as dynamite does. In using dynamite the greatest number of accidents occur warming or thawing it out. 'Azo' explodes frozen as well as warm. Although 'Azo' contains no nitro-glycerine, if, for any purpose, an explosive of extreme violence is necessary, we can run it up to a power 25% greater than that of a pure nitro-glycerine. The mining interests of the West will be supplied from local factories located at convenient places. For mining purposes we can compete with the cheapest grades of explosives. For projectile purposes we will enter the market with a better smokeless powder than any now sold, and at a price of ordinary black powder. The first western plant will be located at or near Bozeman, Montana."

CONSUL SCHUMANN writes from Mainz, Germany: "The telephone service of this country is a public institution, controlled and managed by the Department for Posts and Telegraphs. The rates are certainly very low, the charge for a local telephone being $38 55 per annum, including the rental of the instrument. The service, however, is lacking in enterprise. I applied on February 20 to have a telephone placed in my residence, and was told that the connection could not possibly be made before May or June, as they did not string wires in winter."

The Genesis of Petroleum and Asphaltum in California.

NUMBER XII.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

What evidence is there that water circulates and circulated through these formations? The presence of calcareous tufa at the outcrops of the strata; the presence of bitumen in the cracks and seams of the shales and in the interspaces of the sands floated up by associated waters—if the bitumen was forced up exclusively by gas it would not have been so evenly and generally disseminated throughout the shales and sands; springs of water accompanied by natural gas and oil issuing from the outcrop of strata which dip towards the source of the water, and the absence of these springs from the outcrop of strata which dip away from the source of water; the seams of hard shale, called "shells," silicated by infiltrating silicious waters; nothing but molds and casts of fossil shells, the carbonate of lime having been removed in solution in water. Near the outcrops of these strata in the creek and river beds the sands and gravels are cemented together with carbonate of lime, forming conglomerates.

What is the effect on deposits and accumulations of bitumen by circulating waters, fresh and mineral? Petroleum oil when exposed for a long time to water containing sulphuretted hydrogen is resinified by being sulphurized; especially is this true where the sulphur is liberated by decrease of pressure or by the oxidation of the hydrogen. The sulphurizing of petroleum oils by sulphuretted hydrogen is a chemical combination, but if only a mechanical combination it is so intimate as to resemble a chemical combination.

Petroleum oil will be oxidized when exposed for a long time to water containing oxygen, or atmospheric air. Oxidation converts the oil into petrolene and greatly increases its gravity. As slight quantities of petroleum oil are dissolved in fresh water, the lighter parts are dissolved, consequently the effect of circulating fresh water is to carry away the lighter parts of the oil, leaving the heavier parts behind. Water saturated with salts has but little effect on petroleum oil. Sometimes the salts, through the agency of water, are mechanically and intimately mixed with the bitumen so as to render their separation difficult.

Besides these chemical effects of water on the bitumen, water exerts the following described hydrostatic and hydraulic effects: In cases where strata are rendered leaky by denudation, and water in ascending to the surface through the same, the petroleum oil is floated out on the surface of the water and lost. Meteoric water, which falls on higher ground, penetrates the earth, sometimes to great depths, through inclined and porous strata or through fissures, cracks, seams and joints of rocks; and, after flowing a distance, sometimes the distance being very great, it must ascend through permeable strata to the surface, or, hidden, find its subterraneous way to the sea. The course of water flowing underground is not strictly analogous to that of a river on the surface, there being in one case a constant descent from a higher to a lower level, from the source of the stream to the sea, whereas in the other the water may at one time sink below the level of the ocean and afterwards rise high above it by hydrostatic pressure, due to the superior level at which the rain water was received and the encasement of permeable strata by impervious strata.

It must be borne in mind that the circulation of water through the rocks can be extremely slow. On account of the broken condition of the rock on the anticlines, caused by the acute curvature of the anticlinal arch and its greater exposure to denuding agents, far greater quantities of rock have yielded to erosion than in the syncline where the rocks have been hardened by lateral pressure and cementing by the infiltration of mineral waters. This broken condition of the backs of the anticlines permits water to enter them more freely than the synclines or the slopes of the anticlines, and also permits more readily the escape of petroleum, oil and natural gas. The accumulation of petroleum oil must have commenced when these rocks but slightly underlated. The former and ancient features and state of a formation should be taken into consideration, as well as those existing at the present time, in the examination of an oil field. If there is no opposing force or intervening obstacle, gas, petroleum, oil and water distribute themselves in porous or seamed strata in accordance with the difference of their gravity. The gas lies above the petroleum oil, and the oil floats upon the water. It must be remembered that under ordinary pressure oil and water do not mix, and that the gravity of the petroleum oil is less than that of water, but for which little would have been seen on the face of the earth. If petroleum oil is introduced into the bottom of a vessel filled with water it will rise to the top of the water, and if water is placed on the surface of oil it will sink to the bottom of the oil.

The pressure of water is exerted below the petroleum oil, and the pressure of natural gas above. Porous strata encased in nearly impervious strata must be considered as conduits for the fluids, petroleum, oil and water. When petroleum, oil and water flow in the same direction, the porous and seamed strata are liable to be barren of oil. Where the oil and water flow in opposite directions, the porous or seamed strata are liable to be fruitful with oil.

Many years ago, before the denudation occurred, these strata were encased in an impervious cover; the righthand dip of the anticline was towards the mountains; meteoric water falling on the mountains entered the porous strata at *A* and finally flowed up the righthand dip of the anticline *B* as shown by the arrows, being impelled forward by hydrostatic pressure in the higher levels of the mountains, and the associated oil which entered these strata by its inferior gravity when compared with water, flowed in the same direction as the water, therefore this dip of the anticline is barren of bitumen. In the lefthand dip of the anticline *B* the water flowed downward, impelled by gravity and probably hydrostatic pressure, seeking an exit as springs in the valleys, or, unseen, found its way to the sea; the oil, by its inferior gravity, was buoyed up by the water or ascended in a contrary way to the flow of the water—consequently the pores and seams in this dip are filled with bitumen. These same conditions exist in the Zaca anticline, Las Pozitas anticline lying west of Santa Barbara, and at Summerland and many other places.

The following is an exception to the accumulation of oil in the dip, remote from the source of circulating water. Petroleum oil is nearly always accompanied by natural gas. If the porous or seamed strata, serving for conduits for water or oil, have vertical curves or summits, and such summits are sufficiently tight as to hold the gas, in time the gas will accumulate in such summits and occupy a considerable part of the sectional area, and it will continue to accumulate until the velocity of the water or oil is sufficient to carry the gas forward, and down the incline. If the pressure never reaches such a point as to effect the removal of the gas, the flow of the water and oil will be more or less obstructed; and finally, if the gas is not removed or escapes, causes the flow of water or oil to cease. In this case oil will be found in the dip of the anticline, which is towards the head, from which the water emanates.

Geological Note on the Rand, South Africa.

One of the most interesting features to be met with in the mineral geology of the Rand, says the *South African Mining Journal*, is graphically set forth in the mine plans of the Rose Deep, where a hillock or "roll" occurs in the plane of the Main Reef series in the upper levels of that mine. The only other somewhat similar occurrence, on a scale large enough to afford a useful object lesson, is a flat (or slightly depressed saucer-shaped) area of reef in the Simmer and Jack mine. This "roll" in the plane of the reef apparently enters the northern boundary of the Rose Deep about midway between the two present shafts, just about where the main incline shaft of the New Primrose mine will reach its lowest level. Thence its strike is roughly northeast by east as regards the Rose Deep mine, and presumably southwest by west in the outcrop mine. This peculiarity comes into the workings of four levels between the two present shafts. Mr. Cazlet has made a glass model illustrating this latter occurrence, and it is recognized as being a most valuable help to the clearer understanding of several points in Rand mining geology. This peculiarity of the reef at the Rose Deep is another instance in which a clear understanding of the occurrence would be wonderfully helped by this sort of graphic representation. The best way of imagining what exists is to fancy the hanging wall of the reef series removed and to picture the whole of the workings as open-cast, thus making the reef in its dip practically a hillside. As far as present indications go, the little valley that separates the spur from the main hillside contains a very appreciable thickening of ore deposit. Should this feature be confirmed by subsequent developments, it may speciously be argued that the thickening of reef in this gutter or valley is proof, probably corroborative of Mr. Bleloch's theory, of the conglomerate beds being formed on a more or less gently sloping beach line.

Economy in the Use of Water.

Written for the MINING AND SCIENTIFIC PRESS.

There are many places where the cost of water makes it a very important item of expense, and not only in California, but elsewhere, there are numerous places where it is a matter of economy to run the tailings of quartz mills into reservoirs, and from the overflow to pump back the water for re-use in the mill. Where the tailings contain sufficient value to make their later treatment desirable by cyanide or otherwise, dams may be built across gulches or other depressions and the water returned by pumping, and when the reservoir has been completely filled another may be prepared and this filled in its turn. Where, however, the tailings are practically valueless and may be allowed to escape without material loss, a succession of dams may be constructed, so arranged that the tailings can be settled in the upper basin, the overflow passing to the second, from which the water is pumped back. When the upper basin is full it may be sluiced out, and allowed to refill as before. An arrangement of this kind was made years ago at the Homestake mine in South Dakota. The mill tailings were allowed to flow down the gulch — Gold Run, which below the mine becomes a narrow gorge. Across this two dams were built of cribbed timbers filled with rock, and sheeted on the inner side with boards to make it tight. In the center of these dams were constructed boxes about 3 feet square reaching from top to bottom of the dam. These boxes or shafts, as they might be termed, were closed permanently on three sides, the fourth side being provided with plank sections lying horizontally. The shaft of the upper dam connected at the bottom with a culvert constructed of plank and about 3 feet square. This extended under the upper dam, entirely through the lower basin and underneath the lower dam. The shaft at the lower dam was also connected with the culvert. When it was desired to fill the upper dam, the horizontal sections of the upper shaft were placed in position, and the sand-burdened water gradually filled the reservoir, overflowing at a weir into the lower basin, which had been prepared to receive it. The sectional-closing arrangement of the shaft has no important bearing on the filling of the reservoirs, but is designed to discharge the tailings gradually when the basin is emptied, so as not to choke up the culvert. It required six hours to fill the reservoir with water, all the coarse sand remaining in the upper basin, the slimes passing over into the lower one. Every day the upper reservoir was sluiced out by removing the planks one at a time, the water carrying off the sand which passes through the culvert discharging into the canyon below. It took about four hours to accomplish this. The lower dam was cleaned whenever it was necessary, perhaps every sixty days. An arrangement such as above described can be built at moderate cost, and will be found to operate satisfactorily. When it is desired to save the tailings, they may be impounded below these dams.

Wyoming Irrigation Reservoirs.

Water storage is the key to water use. To regulate the flow in time and in volume is the secret of highest value and effectiveness in any broad system of irrigation. Consequently any proposition to the fullest utilization of flowing water extends upward to its source and to the manner of its release. Reforestation of mountain sides to prevent useless or ruinous flood, restraining dams in the outlets of lakes, dams to backwater over waste flats or in wild gorges, are all phases of water storage which are involved in any broad view of irrigation possibilities, and are interesting in varying degrees to all students of irrigation affairs. The progress made in reservoir surveys in Wyoming is of interest to this entire west half of America, and that if the United States Government can be shown the desirability of proceeding in that State for the reclamation of the desert lands, it is only a question of time when similar work will be undertaken elsewhere. State Irrigation Engineer Elwood Mead has prepared Senate Document No. 124 which is a strong argument for reservoirs on the basis of their essential character as the foundation of timely and effective water distribution. The entering claim is that it is the weakest link which measures the strength of a chain; so in the use of rivers in irrigation, it is not their flood volume, but the discharge at time of greatest need which measures their usefulness and value to farmers along their banks. A river which carries a torrent in December but is a bed of dry sand in July is of little value to irrigation if left as Nature made it. There are hundreds of such streams in the West. They wind their lonesome courses through lands of unsurpassed fertility, where the climate is salubrious and healthful, and where only a perennial supply of moisture is needed to secure the growth of products of great diversity and value. On some the flood period comes too soon; on others months too late. The first objection applies to nearly all the rivers in the northern half of the irrigated region; the second to those in the southern half. The important function of reservoirs is to bring the total supply into agreement with farmers' needs, in order that the water may be more completely utilized. The further the natural flow falls short of accomplishing this the more important are reservoirs and the greater the necessity for their construction.

Prof. Mead writes forcibly also of reservoirs as an aid in distributing water to crops and gives excellent data derived from his long experience as State Engineer of Wyoming. He gives other States credit also for the results of some private irrigation enterprises and shows that in no part of the United States has irrigation wrought a greater transformation or created greater increase in values than in southern California. In much of this region reservoirs are not merely an instrument for the extension of the reclaimed area—they are an absolute necessity. The streams are intermittent in character; instead of having a perennial flow they are torrential in winter, but in summer and fall, when most needed for irrigation, are almost dry. The Sweetwater river, the site of the famous Sweetwater dam, is a typical stream. The winter storms would bring its volume up to from 500 to 1000 cubic feet per second, to recede again in a short time to 10 or 20 cubic feet per second. After the close of the rainy season in March it would shrink to 1 or 2 cubic feet per second, which sometimes ran through the year, but not always. A water supply of this character is of no use to irrigators. Without this reservoir the lands which this river has been made to reclaim would have remained practically worthless.

Prof. Mead also urges reservoirs as a promoter of better methods of irrigation, by doing away with much wasteful and injurious practice and he alludes also to reservoirs as equalizers of stream flow, etc. Herewith is presented some views of proposed Wyoming irrigation reservoirs which combine the useful and the ornamental in an eminent degree, serving good purpose as attractive mountain lakes and suppliers of needed water to fertile fields below.

Saving Fine Gold in Sluices.

To the Editor:—I was interested in reading in a recent edition an account of saving fine gold in sluices, and will contribute my experience.

I have experimented in fine-gold diggings in Douglas county, Oregon, where the gold is very fine and very light, another disadvantage being the quantity of heavy black sand. The ground from the grass roots down shows from 20 to 300 colors to the pan. While experimenting, I tried several different ways, of which the following was the most satisfactory: I used fifteen 12-foot sluice boxes, 12 inches wide and 10 inches deep. In the first box the ordinary Hungarian riffles, the next two empty; in the fourth a ½-inch undercurrent; in the fifth a $\frac{3}{16}$-inch undercurrent out of the ½-inch undercurrent. Thus I have three divisions in the box, the remainder of the boxes being the same as No. 5; first division for the small rock, the second for ½-inch gravel and the third for sand and very small gravel. I cover the bottoms of the undercurrents first with a layer of flour sacks, commencing at the lower end and allowing each to overlap the other. In the same manner, on the top of these, I lay strips of blankets, burlaps and carpets, and secure them with strips of wood nailed to the sides of the undercurrent, and every 2 feet nail laths crosswise on top of the burlaps, which keeps them in place and prevents sand from working underneath. This worked very well for some time, but after four days' run without cleaning up a portion of the gold was lost, and, as it was tedious to clean up, I made an improvement by cutting a slot out of the bottom of the $\frac{3}{16}$-inch undercurrent, 15 feet from the end of the sluice boxes, allowing the contents of the undercurrent to flow through this opening; 18 inches under this I placed a box 5x14x15 inches deep, containing from fifteen to twenty pounds of quicksilver. The stream of the undercurrent falling into the box drives the gold and sand into contact with the quicksilver, where the former amalgamates and remains in the box; the sand is boiled out by the force of the water. This worked well, and the loss from the undercurrent was saved in the quicksilver box. It is unnecessary to clean up oftener than every three or four weeks. When I take the sacks out I roll them up and burn them in an iron pot; the ashes are panned with quicksilver. The other riffles I clean up in the ordinary way. The flour sacks are for the purpose of catching the gold that works through the burlaps. I use a good head of water with the undercurrents set on a grade of 1 foot in 12 feet. Whenever considered necessary, the quicksilver box can be detached and the contents strained. E. Peiel.

Iron Mountain, Cal., April 3rd, '99.

Continuous Bucket Dredges.

To the Editor:—I see an article under the head of "Dredge Mining in California" in your valued issue of April 1st, on which I should like to be allowed to make a few remarks. I notice that the information is evidently derived from the owner of one of the shovel dredges, and is doubtless correct for that style of dredge, but is quite unreliable when applied to one of the continuous bucket dredges. To anyone interested in this work I shall have much pleasure in showing books of account which will conclusively prove that the daily cost of running a continuous bucket dredge as built by the Risdon Iron Works does not exceed $55, allowing for very heavy interest and depreciation; the actual wages sheet and firewood account does not exceed $30 per day. The number of yards which your correspondent states is being lifted per day is much understated in regard to the continuous bucket dredge, which has a theoretical capacity of 2500 cubic yards per day. The actual amount lifted depends largely upon the

skill of the winchman, but, taking it at 1000 cubic yards, an amount which can easily be increased, and generally is, some 50%, or 1500 cubic yards per day, the balance sheet, taking your correspondent's basis of value as 20 cents per yard, comes out very differently, and stands somewhat as follows:

1000 yards at 20 cents	$200
Cost of handling	50
Balance profit per day	$150

One of the best proofs that the balance sheet as shown by your correspondent is not correct, at any rate for a continuous bucket dredge, is the fact that new ones are constantly being built.

R. H. POSTLETHAITE, M. I. E. E.

San Francisco, April 12th, '99.

Shaft Sinking Under Water.*

By J. BURLEY SMITH, C. and M. E.

The Sultana lode is situated on the eastern shore of Bald Indian bay, Lake of the Woods, and about seven miles south of the town of Rat Portage. The mine has large croppings extending thousands of feet, and in a southwest direction passes beneath the waters of Bald Indian bay. Some portions of the vein carry only the merest trace of gold, but several diamond drill holes made on these large lenses of quartz show that they do not continue to any great depth—50 to 60 feet at the most—giving place to large lenses of auriferous quartz, which are characteristic of this remarkable lode.

One of the claims on this lode is wholly under water, the only land on the claim being one small island. This necessitated sinking a shaft through the water to reach the lode. The Sultana deposit or lode may be described as composed of huge masses of auriferous quartz, of lenticular shape, interbedded in the Keewatin schists (Huronian), at or near their contact with the granitoid gneiss (Laurentian).

Sometimes extending for a considerable distance as one enormous lens, again of a number of smaller lenses lying near together and separated only by a few feet of schist. There are no walls to define the width of the zone. It is noteworthy that the schists separating the lenses of quartz is often found auriferous.

A diver was employed to carefully examine the bottom, and finally a location was found having a covering of from 10 to 15 feet of fine plastic blue clay over the rock.

It was intended to sink a crib 60 feet square on the outside and 40 feet inside, using an inner caisson for a water-tight compartment in which to sink the shaft and to then carry a steel lining from a depth of 20 feet in the rock up to the deck of same, and afterwards to build a wall of concrete masonry around the shaft carried up to the same level. The space between this wall and the inner walls of crib to be braced strongly together with timbers and filled with rock.

Owing, however, to unexpected delays, the lateness of the fall season and the stormy weather to be expected at that time, and that we were unable to secure any land in the immediate neighborhood on which to frame the crib, plans had to be changed.

It was decided to build a water-tight caisson on the Queen Bee island, one mile from the proposed site of shaft.

A sloping beach of sand was selected in a sheltered bay, ways were laid down and the work of building the caisson commenced.

Its dimensions are 60 feet square on the outside, 40 feet on the inside (leaving a box space all around about 10 feet wide for the rock ballast to be used to sink it), and 24 feet high. It was strongly ribbed and braced and sheeted throughout with 8-inch square timbers, the whole bolted and spiked together in the strongest possible manner. The heavy 8-inch sheeting being caulked and pitched right up to deck. Valves were provided inside the caisson to admit water, as it was known that the structure could not contain sufficient weight of rock to sink it without this addition.

The time occupied in building the caisson was something under two months. At the end of November, '97, it was launched and towed by tugs to the proposed site of shaft, and a few days later it was frozen hard and fast in position by the ice. Shortly after this the caisson was filled with rock and sunk to the bed of lake.

To make doubly sure an inner cofferdam was constructed inside the hollow square of the caisson.

The water was pumped out with a centrifugal pump and the clay inside the inner cofferdam was excavated down to bedrock. The shaft was excavated the full size of the inner cofferdam, 12 feet into the solid rock.

A strong water-tight shaft-casing formed of timbers 8 inches square and carried up to the deck platform of caission, which had previously been raised 6 feet higher to be safely above flood water mark of the lake. Behind this casing and under its foot, careful sealing with the rock was made by caulking with oakum and filling in with hydraulic cement; the remainder of this space was then filled in with concrete up to some feet above the surface of the rock bed of lake.

From this point upward to platform the space between shaft-casing and cofferdam was filled in with puddled clay. The space still left between the inner cofferdam and inside walls of caisson was filled in with clay and rock, after being securely framed and braced with timbers.

The platform on top was decked in the usual way, and on this platform are erected the temporary buildings containing the machinery and plant of the mine, and a temporary pit-head framing.

The sinking plant and machinery consist of one Ingersoll-Sergeant air compressor and three rock drills; one 80 H. P. boiler, one 8x10-inch duplex double drum steam hoist; one portable steam derrick hoist; one direct-acting steam centrifugal pump, and some ordinary sinking pumps.

The shaft is 6x12 feet in the inside, and is now down to a depth of 153 feet. At a depth of 107 feet a crosscut level was driven southeast towards the shore as a test, and as expected crossed a lens of auriferous quartz 8 feet wide, 35 feet from the shaft.

The shaft was continued down to a depth of 140 feet when quartz was again struck, showing visible gold in places.

The lode dips to the northwest. The shaft is perpendicular and was expected to strike the deposit at a depth of about 150 feet, which, however, was reached at 140 feet or thereabouts.

Very little water has found its way into the shaft through seams or fissures, and we have every prospect of having a dry mine.

*Condensed from a paper read before the Canadian Mining Institute in March.

Sand Blast in Coal Mines.

Written for the MINING AND SCIENTIFIC PRESS.

The sand blast apparatus has come into use for many purposes in coal mines. The cutting power of the jet of sand can be used for cleaning purposes, cutting slag, etc. To make a sand blast, first construct a wood case (*A*), Fig. 1, about 2x2 feet and 4 feet high. Put a T-joint in a pipe at *B* and arrange for the sand to fall from the case to this joint through an inch pipe *F*. Let the air blast from the left through pipe *C*. The air will strike the sand in the globe of the T-joint and combine with it. The discharge of sand passes through *E* and out through a hose *D*. The workman can guide this hose so as to direct the jet of sand against any point. Two forms of sand blast are employed, and both are qualified to operate with either sand, emery or corundum. In one form the discharge of a fine jet of sand or other material is accomplished by means of a blast of air. In the other form the blast is effected with steam. A great velocity is obtained with both types.

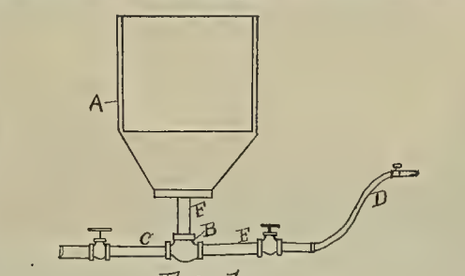

FIG. 1

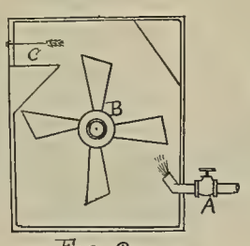

FIG. 2

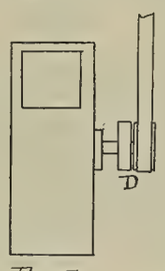

FIG. 3

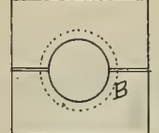

FIG. 4

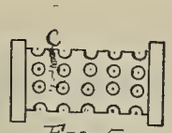

FIG. 5

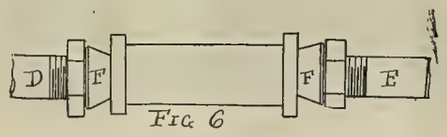

FIG. 6

PLAN OF SAND BLAST APPARATUS.

Practical Points.—Crushed quartz is usually employed in sand blast apparatus. At the same time the work is so varied that several other grades of sand are essential. The sand should be graded by means of sieves, ranging from 8 to 140 wires to the lineal inch. The grade 12 means, as is known, that the sand in this grade passed a sieve with 8 wires to the inch and was held by one with 12 wires.

The shape and condition of the surface of sands has much to do with the effectiveness for cutting, etc. The rock which is broken up into the sharpest sand of all is not as good as some of the natural sands, probably owing to the extremely smooth surfaces. Trap rock is not as sharp as Florida rock, but gives much better results on some classes of work on account of the surfaces of the grains being very rough. The granite is about the same as the trap rock. The comparison of the beach and river sands, with a few exceptions, has proven the latter to be the best for general purposes. The rounded surfaces of sands from beaches are good for cutting, but the time-worn edges might not touch hard slag. Pulverized glass is also used with effect in the sand blast. The specific gravity of the different kinds of glass varies from 3.2 to 4, plate glass from 2.4 to 2.6.

Air Blower.—Fig. 2 is a suggestion for making a small-sized compressed air blower to scatter the air current for light operations. The air current is through the pipe *A*, and passes out through *C*, impinging on the blades of the fan wheel *B* in the meantime. Fig. 3 is another view, showing the plan of the driving mechanism at *D*.

Points on Bearings.—Wood shaft boxes and metal linings are useful in many power drives in coal mines. But in a case recently observed the moisture caused the ends of the boxes to swell and close down on the shafting. No top oil holes were provided, but the oiler once a week would try to force oil from the sides along the shaft into the center to reach the metal bushing *B* (Fig. 4). This he usually failed to accomplish, resulting in the heating and burning out of the busings. This trouble was fixed by providing oil holes leading from the top of the shaft. Bearings of the kind shown in Fig. 5, when worn on one side to a taper, as at *C*, can be trued in a lath on a shaft *D* (Fig. 6). This shaft is cut with a thread and cones *F, F*, screwed on and into the ends of the bearing, holding the latter firm and true during the truing operation. A great many forms of so-called oilless bearings are used in power systems of coal mines, especially in places where it is hard to reach the bearings to oil them. One form is made of glass. I will give directions for making one type of bearings from glass which have worked with practically no oil at all in the box journals of the bearings for a power haulage system. I first glazed a face on the bearing with fine emery wheels. I refined all the glass used for the bearings by pouring it in a molten state. The glass is thereby disintegrated, and, falling in a coarse powder, a portion of the saline impurities is dissolved out. The glass on being drained dry is mixed with fresh raw material. The melting plant I used was a crucible. For hardening I used a mixture of two quarts of olive oil, three ounces of tallow and a quarter pound of beeswax. As soon as the part was cooled sufficiently it was taken out and wiped, then placed over the coke fire until the grease coating was in flames and had burned off. I finish the face of the bearings with rubbers and Venetian powder. The powder contains only a small portion of oxide of iron, mixed with earthy matter. It admits of being mixed with water, and thus reduces friction and prevents the glass from becoming heated by the action of the rubbers. Tripoli, crocus or putty powder used with water are too active to produce a high polish on glass bearing surfaces, but they may be employed dry for the last finish in hand polishing.

Repairs.—Special care is needed to keep in repair such mechanical apparatus as is in constant service in coal mines. The mechanism of cable systems, underground wheels, etc., require regular examinations. It will pay to clean the rust off the machine and polish it up with a wire scratch brush. A vigorous use of this tool, reinforced by a cold chisel and hammer, will work a transformation. An underground machine, once clean, should be painted with boiling hot gas tar and allowed to dry at least two hours—better two days—before putting back into the pit. The case should receive the same treatment. Bolts, nuts, gears, cranks and cams are used to a greater or less extent, and these small fittings are invariably destroyed by rust before the larger parts of the machinery have gone bad. F.

THE present activity in the mining and metallurgical world has resulted in bringing the process man to the front again. Almost daily new processes are heard of which promise to revolutionize mining and cheapen the cost of the recovery of gold to such an extent that the entire operation of gold recovery is placed by some at a lower figure than the actual cost of reduction of ore to pulp by ordinary methods. One statement is made by a Duluth, Minn., process man that his process has resulted in lowering the cost of a 100-stamp mill $15,000, which stamps the whole thing as ridiculous. Radical changes in processes are usually the outgrowth of long-continued, careful experiment.

Mining Summary.

ALASKA.

D. A. MacDonald of San Francisco has a letter from B. B. Earl, dated St. Michael, Dec. 1, '98, in which the writer, among other statements, says: "Dr. Kittleson arrived here Nov. 28th and reports great finds at Cape Nome, about five miles from shore. So far but two creeks have been worked. They found coarse gold 2 feet from the surface. Things are booming on the upper Neukluk river and claims are prospecting well. The Cape Nome mining district has been formed and takes in a square of twenty-five miles, with Dr. Kittleson as recorder.

"A rich discovery has been made on the Casadepaga, thirty miles northwest of Council City, which shows the source of the gold is farther in the interior than was supposed.

"Ophir creek, in El Dorado district, is rich. It is reported that $48,000 has been taken out on No. 4 above discovery. Another strike this winter was made on the Tubucktolik river on Nov. 20th. MacDonald creek, on the Anvik river, where the first discovery of gold was made in paying quantities in northwestern Alaska, has turned out well. The gold is coarse.

"A miners' meeting was held in Council City and Recorder Blake was impeached for being absent from the district for thirty days. Blake declares the meeting illegal and refuses to turn over the books to the new recorder. Council City has 500 population and contains about seventy-five log houses."

It is reported that there are eleven steamers icebound in the Yukon river at various points, which on the breaking up of the ice will be wrecked.

Juneau *Miner*: The season is more favorable for early work at the Silver Bow Basin placer mines of the American G. M. Co. this spring than it has been for several years. The basin has not as much snow as usual. It is thought that by April 15th the giants will be at work. ——Prospecting has been in progress at Ketchikan and vicinity for the past year. A number of promising ledges were discovered and development has proceeded steadily. Some discoveries of quartz have been recently made.——W. J. Terry made the trip from Dawson to Skaguay in eight days, riding a bicycle.

Juneau *Miner*: The production of gold from Cook inlet this season will probably double that of last year when the water was very high and much interruption was experienced by miners, and their works carried away. The estimate made last year was $100,000. A. Beedy and his brothers have been mining in Cook inlet for several years. They sold their Bear Creek hydraulic property last year to Boston parties for $10,000, and the deposit will be worked this season. It has a small plant upon it, which will be increased. Beedy Bros. intend to hydraulic their mine on Palmer creek, and their Canyon creek property will be worked by shoveling into the boxes. Several hydraulic plants will be in operation this season on Six Mile creek and Bear creek. One large plant was put in on Bear creek last spring, too late to be of advantage. It will be worked this year; the mine is owned in Phidelphia.

ARIZONA.

(Special Correspondence). — The new purchasers of the Mollie Gibson mine at Chloride have commenced putting things in shape to begin work. As preliminary the water in the 80-foot shaft must be pumped out, when timbering begins. The timber will be framed at Flagstaff. This completed, sinking will begin to 200 feet, through the ore body. The ore is rich, much of it containing wire silver. The mine was sold for $8000.

The late discoveries of new and rich ore bodies in the Tennessee mine has resulted in an increase of the working force. The new concentrator is doing satisfactory work. The ore dump, which accumulated during the erection of the new works is disappearing, the new and richer ore taking its place. The concentrates go to the railroad at Kingman. Three shifts are working.

An accident happened at the Elkhart a few evenings ago resulting in the instant death of John D. Young, bookkeeper for the company. Robt. J. Ferguson, the superintendent, was showing Judge Sloan of Prescott the mine. They were at the bottom of the main 280-foot shaft and Young stepped into the bucket to go down when it became detached from the cable and went to the bottom. The bucket had dropped once before within a week. Work continues as usual in the mine. There is a large quantity of ore on the dump, but no water to operate the concentrator. The concentrates from the Elkhart are high grade.

Chloride, April 18th, '99.

Near Globe the Live Oak M. & S. Co. is shipping about fifty tons of bullion a week and chloriders are shipping fifty tons of ore daily.

Anthracite is reported discovered near the border of Sonora and Arizona, samples of which have been sent for investigation.

Needles *Eye*: The Little Jessie mine at Chaparral, twenty miles southeast of Prescott, has been incorporated. The mine has paid well. The ore is pyrite running seventeen ounces gold per ton.

Yuma *Sun*: The 100-ton cyanide plant at the Fortuna mine, eighteen miles northeast of Yuma, was started up this week. The tailings on the dump average about $5 per ton. ——The owners of the Ray copper mine in Pinal county are making arrangements to put in reduction works on their property. London capitalists are in the deal and a railroad will be built from the mine to the Southern Pacific.——Work on the Planet Saturn mine in Fool's gulch has been resumed and a force of men are busy developing the property. A 10-stamp mill has been ordered and an air compressor and drills will be used. The present work is an experiment. The property was once abandoned, but it is thought that by a new process the ore will pay.

Journal-Miner: W. H. Ferguson has gone to the Ridenour mines, in Mohave county, as Supt., accompanied by J. S. McDonald, who takes the position of foreman of the mine. He has sent two twelve-animal freight teams with $1600 worth of supplies. Mr. Ferguson has employed sixteen miners, which number will be increased. The claims are known as the Grand Canyon group and are located north of Aubrey, on the Santa Fe Railroad. It is expected that a carload a day will be shipped from the mine to the Pueblo smelter.

Arizona *Republican*: Mining in Cochise county is advancing. Nearly every day brings representatives of Eastern capital looking for copper and gold properties.——D. J. Dwyer, Supt. Helvetia copper mines, now being developed, has arranged for the shipment of machinery to the camp. Six carloads of machinery were received during the past twenty days.

Mineral Wealth: A contract has been let on the Midnight mine at Chloride to sink a double-compartment shaft 200 feet. Levels and crosscuts will be run.——B. Hastings, Supt. of the gold mines at Virginia Camp recently purchased from Cooke Bros. & Blythe, will sink two shafts on the property.——Stetson & Nugent have had a carload of ore worked at the Kingman Sampling Works from the Segregated Blackfoot, and W. C. Mayes two carloads from the Loomis mines in Virginia Camp.

Mojave *Miner*: E. J. Montrose's gold mine, south of Coyote Holes, has turned into a copper producer.——W. Nelson has located the old Hornet Nest mine, near the Little Boy, Stockton Hill, has sunk a shaft 100 feet in depth, and is shipping ore found all the way down. It is the intention to sink another 100 feet and block out the ore body. The ore carries a high percentage of copper.——Five more stamps will be added to the mill at Virginia Camp to work the ores of the Klondike mine. Other machinery will also be put in. ——It is reported that a 15-stamp mill will be put in at El Dorado canyon. Gasoline wagons will haul the ore from mines to the mill. The fifty-ton cyanide plant is in operation.——It is reported that W. C. Bishop has struck a rich body of ore in one of his Stockton Hill mines, where he has been working three or four months.

Bisbee *Orb*: The new three-compartment shaft being sunk by the Copper Queen Co. is down 40 feet. The gallows-frame is to be of steel set on a stone foundation and will not be connected with the collar of the shaft in any way. Three eight-hour shifts of four men each are in the shaft and two windlasses are used to hoist. Plans for the hoisting works are completed and a large hoisting engine and pumping plant will be put in.

Jerome *Reporter*: In the shaft on the News mine at a depth of 124 feet they have struck a vein of copper sulphide 4 feet wide. The shaft will be sunk 600 feet before drifting. A hoisting outfit is on the way and power drills will be used.

Tombstone *Epitaph*: J. S. Tebbets, Mgr. of the Duquesne M. & R. Co. in Washington Camp, fifteen miles from Nogales, says the ore runs 10% copper and five ounces silver, also some gold. The mine is developed and a special process has been devised for treating the ore, it being sulphide. The company will build a branch railroad.

Prescott *Courier*: J. Phillips at the Tip Top mine, a few miles from the old Dosoris, has started two tunnels on the property. The ore body is 4 feet wide. The pay streak ranges from 1 inch to 1 foot in width and the ore carries from $50 to $700 per ton. The gold is coarse.

CALIFORNIA.

Alameda.

Oakland *Enquirer*: It is reported that a gold-bearing quartz ledge has been struck in a tunnel in the hills near where the Thorn road crosses the boundary line between Alameda and Contra Costa counties, by men who were tunneling in search of water.

Amador.

Amador *Record*: It is reported that work will be resumed at the South Spring Hill mines, Amador City.

Jackson *Ledger*: The shaft of the Gover mine near Drytown has been caving during the winter. The hoisting machinery, located on the hanging wall of the shaft, commenced to settle and was moved back.——At the Amelia operations are confined to keeping the water out of the shaft. It is reported variously that prospecting through the old shaft will be resumed; that the present shaft is to be abandoned and a new one sunk near the Muldoon shaft; that operations are to be suspended permanently.——At the old Bunker Hill mill near Amador City, which was destroyed by fire last year, men are at work cleaning up.——The Anita mine near Jackson has shut down and the machinery removed. The hoist was not capable of continuing sinking and handle the water and a new plant will be necessary if development continues. ——At the Keystone, Amador City, the gasoline engine put in to run twenty stamps it is claimed runs at the cost of water.——A contract has been let to sink the shaft on the Amador Queen No. 1 200 feet from the 1130. It was awarded to Crocker, Kearn, Benwald & Schott.——A 75 H. P. boiler has been put in at the Ivanhoe and a new engine and hoist will be put up. One run has been made with the 20-stamp mill.——Supt. Parks has made the monthly shipment of bullion from the South Eureka mine and also from the chlorination works at the Kennedy mine at Jackson.—— A large body of milling ore has been found in the south drift at the 1600 level of the South Eureka mine. The drift has been driven alongside the ore 60 feet and has not reached the end of it. A crosscut 12 feet has been made in the ore body.

Jackson *Republican*: Shaft repairing is in progress at the Zeila mine.——At the 500-foot level of the Lincoln mine a crosscut is being run north. The shaft is down 900 feet; 1200 feet is to be reached before opening new levels.

Calaveras.

San Andreas *Citizen*: The clean-up of the new 10-stamp mill at the Ford mine, San Andreas, was satisfactory, yielding a profit over expenses. The sulphurets were shipped to the Selby Works.——There was a clean-up at the McSorley hydraulic mine near Mokelumne Hill on Thursday.——The Boston mine, near Mokelumne Hill, is running with reduced force.——At the Mayday tunnel, run from the Murphy-Altaville grade to tap the Mayday lead, work has been resumed.——The Central Hill Co. hydraulic mine at Murphy's has made a clean-up after a run of two months. It will take but a short time to work the channel out. ——The Lightner Co. at Angels will increase their mill from twenty to forty stamps.—— The Angels M. & M. Co., operating the Fox mines at Angels, the property of J. V. Coleman, is planning to operate on a large scale. ——The St. Lawrence M. Co., developing the Brunner mine, three miles south of Angels, is sinking a three-compartment shaft. They are down 200 feet.——Greenwalt & Gazzola have been awarded the contract for excavating for the 120-stamp mill at Robinson's Ferry for the Melones M. Co.——The Yellow Aster at West Point has started up under the management of its new owners—Morgan, Doane & Jackson.——The Lockwood, three miles south of West Point, and Lone Star, two and one-half miles north of West Point, are to be started again, also the Blizzard in Sandy gulch, under the supervision of Mr. Griswold. There is a pump on the way for the last named mine.——Ore from the Occidental mine, owned by Figueroa & Araya, is being hauled to the Nixon Reduction Works.——The Defendant mine, near West Point, has been sold for $6000.——P. Lewis, owner of the Poorman mine near Glencoe, is having the shaft retimbered.

Del Norte.

(Special Correspondence).—Agents of English capital are here inspecting copper propositions throughout the county.——W. McKee has uncovered a ledge of decomposed quartz in his placer claim on Garrison gulch, Bald hills, which prospects well in fine gold.—— The tunnel work on the property of the Jones Creek M. Co. is progressing slowly, something like 200 feet being cut at last accounts. ——Jenkins Bros. & Lewis are grinding ore. Judging from pan prospects, they should make a good cleanup.——The black sand mine below Crescent City has resumed operations. ——From reports prospectors will be numerous this summer in the hills of Del Norte.

Crescent City, April 14th, '99.

Del Norte *Record*: W. F. Fleming has returned from Low Divide and reports that work of clearing out old drifts in the Union copper mine is progressing.

El Dorado.

J. Melton, at the Joe White claim on Poverty Point, is running the 15-stamp mill. The mine is equipped with a compressor plant.

Dench & Craddock are reported to have struck rich ore in their claim adjoining the Limpensel, near Placerville. The streak is said to be 8 to 14 inches wide and will go $150 to $200 per ton.

In the Diamond district the work of development is being actively prosecuted.

A strike is reported on the 200 level of the Marguerite mine; also, on the 600 level of the Griffith Con., near Placerville. The Marguerite M. Co. of Placerville bought the Marguerite mine six months ago and have done considerable development work. Chas. Lilly is Pres.; P. Maul, Vice-Pres. and Supt.; W. W. Tenney, Sec. and Treas.

At the Crown Point, south of the Griffith, high-grade ore is reported on the 400 level.

Development is to commence on the Big Sandy mine, Kelsey district, by an Eastern company.

Placerville *Nugget*: A strike is reported in the Ribbon Rock mine, Diamond district.—— The German mine, near El Dorado, is adding ten stamps to the mill. —— At the Strahle slate quarry, near Placerville, work has recommenced.— Clarissee & Hill are developing the Log House and Golden Eagle claims, near Nashville. A tunnel on the Golden Eagle is in 90 feet.——H. S. Casey & Sons, at the American River mine, five miles below Coloma, are taking out good ore.——Larkin Bros., owners of the Coma quartz mine, Diamond district, are having 100 tons of ore crushed at the custom mill in Placerville.

Georgetown *Gazette*: The Ralston Divide G. M. Co. will run four new tunnels this spring. A large force of men are at work developing the claims.

Amador *Dispatch*: Mining is active near Gold Hill since the Cambria Co. started up. A 10-stamp mill has been erected and the ore yields $12 per ton.——J. Nouges Jr. of San Francisco at the Josephine mine near Georgetown in tunnel No. 5 has a vein 9 feet wide. The 15-stamp mill will start up next month. ——The 15-stamp mill at the Poverty Point, owned by J. Melton, is in operation. The ledge is 40 feet wide, all of which pays.

Placerville *Nugget*: It is reported that the Gentle Annie mine, near Placerville, has been sold. The sale is conditional, the purchasers having a short time to prospect the property. A Pittsburg syndicate, the prospective purchasers, took possession of the property on the 18th inst. H. E. Picket will be the resident manager and P. C. Gorrie will be in charge at the mine. The Gentle Annie has a 10-stamp mill and is developed to a depth of 400 feet.

Inyo.

Walker Lake *Bulletin*: H. Cook and partners of Salt Lake, Utah, who for years have been driving a tunnel in Mazourka canyon, are in 1400 feet and have a vein of rich quartz.

Lake.

Napa *Register*: During the month of March the Great Western quicksilver mine, near Middletown, shipped 100 flasks of quicksilver.

Los Angeles.

Los Angeles *Mining Review*: The 3-stamp mill on the Los Angeles G. M. & M. Co.'s mine at the head of Sepulveda canyon, near Hollywood, is in operation, the ore milling $20 per ton in gold. Over 200 tons have already been taken out.

Madera.

The Lilly and North Lilly mining claims, two miles from O'Neill's, have been incorporated at Rossland, B. C. They were purchased by D. J. McDonald and Alex McDonald fifteen years ago and developed and a quartz mill built, which was burned, and the property sold to an English syndicate. The property has now been acquired by a syndicate made up of D. J. McDonald of the Columbia-Kootenay, A. Dick, R. Thompson, D. M. Linnard, C. R. Hamilton and H. McRae of Rossland and A. M. McDonald of San Francisco. The mine is opened by an incline on the vein to a depth of 375 feet and 1000 feet of drift. A. M. McDonald, recently Supt. of the Kanaka mine in Tuolumne county, has been appointed Supt.

Mariposa.

The Mount Gaines mine, five miles west of Hornitos, is again in operation with a full crew. The installation of electric power is contemplated.

There are a number of small rich veins on the Mariposa Estate which could be worked with profit by leasers if suitable arrangement could be made.

Mono.

Bridgeport *Chronicle-Union*: It is reported that the Dunderberg mine is to be reopened.

Napa.

Napa *Register*: In March Napa county quicksilver mines shipped as follows: Napa, 600 flasks; Ætna, 200; Vallejo, 16. This is a decrease of 54 flasks from February. The Ætna reports gross receipts of $35,405; operating expenses, $20,954; net earnings, $14,450, out of which a dividend of $10,000 has been ordered, leaving a surplus of $4450. The Napa Con. reports gross receipts of $65,700, and $32,931 for operating expenses, $32,768 net, out of which a regular dividend of $10,000 and an extra of the same amount have been declared, with a surplus of $12,768. These dividends make $1,000,000 for the Napa in twelve years.

Nevada.

Nevada City *Herald*: It is reported that Brown, Cairns & Co. have struck a ledge near Nevada City that is very rich.

Grass Valley *Tidings-Telegraph*: The Gold Point mill at Grass Valley, recently completed, started ten stamps. The rock is not of good quality; considerable work is necessary before a pay shoot is reached. F. Richards is Supt.

Grass Valley *Union*: The W. Y. O. D. mine at Grass Valley, of which T. H. Simonds is Supt., employs sixty men on day's pay. The mine is reported looking well in the lower levels.

Nevada City *Herald*: A new shaft is to be sunk on the Holbrooke gravel mine near Grass Valley, 700 feet south of the old shaft, so as to be able to work up the channel.

Placer.

Colfax *Sentinel*: It is estimated that twenty-three mines of the Ophir district have produced $1,576,000. There are several other important mines whose output is not included.——W. Houchin of Auburn, owner of the extensions east of the Centennial, Hope and Conrad ledges, is now engaged sinking a shaft down 112 feet on the ledge in slate and granite contact.——The Crandall mine on Duncan Hill is a new enterprise, owned by W. A. Freeman and B. F. Hartley of Auburn, the latter being Supt. The new 5-stamp mill is running steadily. The tunnel runs on a 5-foot ledge. Twenty men are employed at the mine. For power 40 inches of water is used under 240 feet head.——At the St. Lawrence mine, owned by C. A. Reed of Ophir, the ledge runs from 1 to 3 feet. The tunnel is in 800 feet. Stoping is in progress at a point 600 feet in. The mine has a Huntington mill and a 5-stamp mill. Power is derived from 30 inches of water, 160 feet of pressure.——At the Bellevue quartz mine the shaft is down 170 feet. Drifts have been run east and west at the 140-foot level, producing good free-milling quartz.——At the Gold Blossom mine at Ophir forty-eight men are employed; W. B. Fisher is Supt. Fifty-six tons of quartz are mined and run through the 20-stamp mill each day.——At the Hathaway mine, A. B. Eastwood, Supt., has twenty men on the payroll. The 20-stamp mill is crushing an average of twenty tons of $8 quartz per day. The shaft at the mine is down 630 feet.——At the Black mine an Eastern company has commenced the development of the property. The shaft is down 300 feet.——The most extensive quartz mining development in this county is in progress under the direction of E. W. Chapman at the Three Stars mine, seven miles west of Auburn in Ophir district. The mine is being opened up by three shafts. The Star shaft is 725 feet vertical; the Belmont shaft is 230 feet deep. Compressed air power is used. A pipe line conveys 120 inches of water 5280 feet.

Nevada City *Transcript*: The Gold Channel Gravel M. Co. near Emigrant Gap at a recent meeting in Grass Valley decided to proceed at once to put up new hoisting and pumping machinery and proceed with development. The owners are G. Mainhart, A. W. Hyett, R. Scanlon, W. L. Baker, G. Gehrig and C. Pecor.

Republican-Argus: The Lost Camp mine at Blue Canyon has been shut down owing to a cave in the main tunnel.——At the Gold Blossom mine, near Ophir, sixty men are employed in mill, hoisting works and mine, under Supt. W. B. Fisher. The mine and mill have been in operation for fourteen months, after a long

idleness.——At the Grass Ravine mine, near Ophir, last week, the new 5-stamp mill and hoisting works were burned, a day or two before crushing ore was to have commenced. T. W. Waterhouse, Supt., has fixed up a temporary hoist and work upon the mine has been resumed.

Plumas.

Marysville *Appeal*: F. H. Rood will employ four or five men to reopen the Star of Plumas mine, Buck's Valley, running the tunnel to develop the channel of auriferous gravel.

Riverside.

Redlands *Citrograph*: At Ingersoll & Esler's Virginia Dale mines one shaft is down over 200 feet. Development is progressing, only enough ore being extracted to pay expenses.

San Bernardino *Transcript*: In the Paradise mountains, on the desert, parties are developing the Dream and Guardian claims. Not over a half-mile distant are the claims of H. Galerone, in which a number of San Bernardino people are interested. The Galerone party are at work and are down 35 feet on the Ontario. They have taken ore from the Klondike claim to the mill.

Los Angeles *Mining Review*: The Good Hope mine, four miles southwest of Perris, is being worked by leasers, it is reported with satisfactory results. The old tailings dump is being worked by cyanide.——Several parties have been investigating the Santa Rosa mine, six miles west of Perris, and it is expected that pumping will commence next week. The mine has been idle several years and is flooded.

Riverside *Press*: Hammitt & Cage have sold one-fourth interest in the Federal Loan and Bess mines, west of Perris, to a Riverside man, the consideration being that he erect a 5-stamp mill on the property. Assays lately return $4.50 to $6.——It is reported that W. F. Bray has secured for Los Angeles parties an option on the Santa Fe group of mines, six miles west of Perris.

Sacramento.

Folsom *Telegraph*: Prospecting will be resumed on Sailor Bar, near Folsom, 400 acres of which is under bond, and if the property meets the expectations of the syndicate, a Risdon gold dredge will be built upon the bar. The syndicate contemplates building three or four dredges in this vicinity, and there is enough land under bond for that purpose.

San Bernardino.

The copper properties near Kleinfelter, now being developed by Witt, Knight & Anderson, are looking well. Copper values run up to 40%.

Copper occurs in the low limestone hills west of Manvel in the form of chrysocolla (silicate of copper), also in the Exchequer district, north of Homer station.

It is reported that there are large deposits of zinc ore in Old Woman's mountain, south of Danby.

San Diego.

Escondido *Times*: The new 5-stamp mill recently put up at the Escondido gold mines by the Cleveland-Pacific M. Co. is in operation. These mines were first opened and operated years ago by Mexicans, who crushed the gold in arrastras. More recently a rotary mill was built and after a brief period was shut down. The new stamp mill is returning to the recognized successful method and success now depends upon the mine and management.

Shasta.

(Special Correspondence).—There is great activity in mining in this county. Individuals and corporations are camped in various sections of the county, making locations and developing properties. The daily output of the Mt. Shasta Co. near the town of Shasta averages about twenty-five tons, which is hauled nine miles to the smelter at Keswick. I am informed that the Mt. Shasta Co. has secured within ten days eighteen new claims.

Moore & Small last week sold three claims to San Francisco people, who have begun operations. The property is pretty well opened.

A. E. Pryor of San Francisco has opened a large ledge of fair grade ore in Shasta district.

R. Shaw recently sold three claims to the Mt. Shasta Co. and is developing three claims, from which he is hauling ore.

J. W. Lees & Co. are developing four claims about four miles from Shasta. They have a 140-foot tunnel on a 10-foot ledge of $6 ore. On another claim they have a 7-foot ledge of fair grade ore, all of smelting character.

J. L. Herbert is developing a claim near the Mt. Shasta mine, in which he has a 4-foot ledge of good ore.

Pryor & Lees are developing a claim in which they have a 6-foot ledge.

B. McGinnes is opening a ledge in which he is following a seam that is paying above operating costs.

Pugh & Menzel are taking out ore which yields fair returns by concentrating.

Dr. Crabb has a 200-foot tunnel in good ore.

J. Meier is employing eight men, running four tunnels and taking out sulphuret ore.

The Bully Hill mine at Copper City has been bonded to C. A. Hamilton of San Francisco.

The German syndicate developing copper properties at Stillwater are receiving proposals for a smelter. The company's representative is Geo. Boyha, at Redding.

The Ballakalela group of thirteen claims at Windy Camp is bonded to Eastern people and a sale is pending. The agents recently secured, in addition to the Ballakalela holdings, one-half section of ground and seventy-six locations. There has been expended on the Ballakalela copper property over $30,000 in development. The property is owned by Murray & Co.

Work is progressing in reopening the Black Bear mine an Muletown mountain.

The Black Spider mine near Keswick has reached 65 feet depth on a 25-inch ledge of high-grade ore.

J. Kahny & Co. are developing a property near Shasta that is one mile by half a mile in extent.

Price & Watechek are opening a property on a large scale in Muletown district.

Saeltzer & Co. of Redding are opening several claims near Stillwater in which they have copper, and a ledge of silver ore that carries good values.

W. Russell is shipping $12 ore to Keswick from Muletown district.

Taylor & Epperly are developing a large ochre ledge in Shasta that carries values.

There are in Shasta county sixty-eight idle mills, monuments to lack of knowledge of the ores in days gone by. Now these base ores are being successfully treated and mining has taken a new impetus in these parts. As yet the cyanide process is still in the experimental stage in this section, though I am told that Mr. Charles Butters is putting in an experimental plant at Kennet, which, it is thought, will be in operation late this summer.

Shasta, April 18th, '99.

At the Mount Shasta mine the purchase of ore for flux by the Mountain Copper Co. of Keswick, twelve four-horse teams being constantly employed, creates considerable activity.

Mountain Copper Co. stock at present sells at $35 per share, which would represent a value of $8,725,000 for the property.

Redding *Free Press*: Work on the Jackson group of mines in Backbone district has been ordered discontinued by the owners.

Shasta *Courier*: Stolberg & Maurer are pushing work on their claim on Shurtleff Hill. They will put in 300 feet of tramway to the wagon road to ship ore to the Keswick smelter.

Sierra.

Grass Valley *Union*: W. Ring, F. S. Foltz and W. Geary of San Francisco have gone to the Gold Ridge and Hilda mines, near Sierra City, where they have a permit to hydraulic. These mines will be worked by the drift method in the future.

Nevada City *Transcript*: The Alaska mine, at Pike City, is to be reopened, also the Grizzly mine, by the London & California M. & M. Co., Ltd., an English corporation, W. B. Dunlap of San Francisco Supt. A new shoot of high-grade ore has been discovered on the Alaska 1000 feet west of the old shaft. A new shaft will be sunk on this ore shoot, using electricity for power. A new mill will be built on the site of the old one that was destroyed by fire a few years ago.

Siskiyou.

Yreka *Journal*: Austin & Co., after drifting 150 feet south in their claim on Yreka Flats, and finding little gold, drifted north. On Monday they took out $4, on Tuesday $14 and on Wednesday $60.——In the Salmon river section the quartz, hydraulic and placer miners are busy, having plenty of water.——At Oro Fino the hydraulic claims are in operation.——Spengler Bros., who have been ground sluicing at mouth of Humbug, are moving their derrick up the creek and will hoist gravel into the sluices with steam machinery. The claim was idle all last year, owing to lack of water.——The steam prospecting machinery for boring to bedrock has been at work for a week in Cottonwood creek, between Klamath river, Henley and Hornbrook, prospects being satisfactory.——Placer locations have been made this week two miles west of the Yreka and Scott Valley wagon road south of Yreka. Quartz locations in same locality are also being opened by prospectors. The miners call that section the New Klondike mining district.

Trinity.

(Special Correspondence).—The Trinity Center Co. proposes putting in a dredger in Trinity river, two miles from Trinity Center. The Katie Folley mine has a shoot of ore and a 2-foot vein in the 1st level. Geo. Carr has shipped some ore to Selby's from the Forget-Me-Not mine. Strode Bros. have started up their mill. They will put in five more stamps. The Bloss & McClury gravel mine of Trinity Center, owned by Thomas McDonald & Co., has now four 4½-inch nozzles playing on the gravel bank and expects to wash about nine acres of ground. They have twenty men employed on each shift. Vollmers & Stoddard have run through a ledge 60 feet wide, averaging about $6.21 in free gold. F. Hurst, formerly of Harrison gulch, has bought the Dewey mine on Coffee creek. The Duffenbacher M. Co. on Coffee creek is putting up a 10-stamp mill, two compressed air drills and an air compressor. They have a 2-foot ledge and have fifteen men on each shift. On the dump are about 400 tons of ore, mostly telluride. The Red Flag, owned by Wagner & Carr, has tapped a 2-foot ledge of good ore 120 feet below the surface, in hard granite. The Nash mine is doing extensive work. They have about sixty men employed. W. B. Frue Jr. has opened his mine and will put up a plant to treat forty tons a day.

Carrville, April 20th, '99.

Redding *Free Press*: The black sand in the placer mines of Trinity river has been assayed and reported to contain $13 in silver.

Tulare.

The bonding of the Deer Creek mine, near Porterville, by J. McDonald of San Francisco a few weeks ago has given an impetus to prospecting.

The district near the Lime Kiln, near the Indian reservation, is being invaded by prospectors and some good ore found. J. C. McCabe found a good lead in that vicinity a couple of years ago.

Tuolumne.

Walton Smith was killed at the Norwegian mine near Jackass Hill on April 11 by a plank falling down the shaft which had become unfastened from the skip. Geo. Gibbons was killed the same day near the power house of the Tuolumne Water Co. by the bursting of a 24-inch steel pipe which he was testing.

Sonora *Independent*: T. T. Lane and R. C. Davis are about to open the Sonnet mine, near Riverside, this county.

COLORADO.

BOULDER COUNTY.

The Dolly Varden at Sunset has passed from the St. Anthony M. & M. Co. to Eastern parties. Consideration $110,000, $25,000 down, balance in quarterly payments.

Other Eastern parties have the Victoria, one of the biggest gold and silver mines in Boulder county. G. A. Blaisdell of Boston is one of the purchasers. The consideration was $125,000.

The Smuggler, it is said, has been leased and will be worked. It has yielded over $1,000,000. The Invincible at Jimtown, is in good ore and has begun shipping.

Ward *Miner*: J. T. Hilliard of St. Louis, Mo., president of the Hematite G. M. & R. Co., has spent the past ten days in Ward. He and associates have secured from J. W. Piazzac and P. Miller the Calambia group of three claims and the mill in Spring gulch, near the Morning Star mine. The company has experimented in treating the low-grade iron sulphide ores of this camp and found that by their process it was an easy matter to save nearly their full value at a small cost.——The Dolly Varden deal was closed Wednesday. The property was sold for $150,000 to N. Gregg and New York parties.——The Ward smelter will be blown in as soon as the weather permits necessary improvements, and a bricketing machine will be installed to handle the fine concentrates. The company is pushing ahead the St. Louis to cut the King lead, and on the Success adit; also prospecting in the Miser's Dream.

CHAFFEE COUNTY.

The Twin Lakes Placer Co. (Ltd.), an English corporation, has been working several years in the Arkansas valley, between Granite and Twin Lakes. They own 5000 acres, patented. The water supply is carried by four miles of ditch and flume, and another ditch is in contemplation which will secure water from above Twin Lakes. the improvements to cost $50,000. The profits of last year were $60,000. The manager is F. Harvey, who is now in England.

The Twin Lakes Con. Placer Co., of Milwaukee and Kansas, is ready to commence work as soon as the weather permits. They own 3800 acres of patented land, and it is claimed the quartz will average 35 cents per yard.

CLEAR CREEK COUNTY.

Although the tunnel has been completed three years, the Lamartine has been hoisting high-grade ore to the top of the shaft, where it is loaded for shipment. Arrangements have been made to bring the ore down Trail run from the mouth of the tunnel, making a saving of three miles. The snow is still deep around the shaft house.

The Lone Tree mine, below the mouth of the tunnel, is filled up with ore, which it begins moving this week. In the adit level a body of ore was opened. Some is smelting, but the greater part is milling ore.

Leasers at the Freeland mine are finding bodies of mineral in the virgin ground. The Minnie is shipping forty tons per day. The Toledo, on the opposite of the gulch, is also being worked, producing gold-bearing copper ore, some of which is shipped to the Argo smelter.

In drifting on the recent strike in the Alpinde mine at Georgetown a distance of 60 feet has been gained in the ore body. Mgr. J. Turck has shipped thirty tons of ore that runs $300 to the ton. Stoping on the ore will begin. The old level, which has reached 1000 feet, is being driven to cut the same ore. Work has commenced on the 600 and 750 levels.

Idaho Springs *Mining Gazette*: Lundy & Co., who have been operating the Clyde and other lodes up Virginia canyon, have a large streak of $100 ore in a crosscut. A shaft was sunk at the breast of the tunnel, in which a streak of ore was discovered. Also a crosscut was run north back of the shaft in the tunnel. In 60 feet this crosscut tapped a vein carrying 2 feet of solid ore, tests from which showed a value in gold and silver of over $100 per ton. This enterprise is backed by Utah capital.

Silver Plume *Standard*: The Seven-Thirty has been shipping a large amount of ore, which was packed down from the mine on jacks and then hauled to the mill in wagons.——G. Wheeler is hauling ore from the Stevens to Graymont and says there are 300 sacks in the mine yet. Some of it is inside the tunnel, which is blocked with ice.

DOLORES COUNTY.

Rico *News-Sun*: The Enterprise mine at Rico is reported employing more men than at any time in three years.

GILPIN COUNTY.

The Gregory-Bobtail properties, at Black Hawk, have passed into new hands. The amount of money paid for the property is not public. The new owners are H. R. Wolcott of Denver, L. T. Bush of New York, who is president of the Gold Coin Mines Co. in this county; J. S. Bache of New York; B. B. Lawrence of Clear Creek county, and A. L. Collins of Central City. The purchase includes the Bobtail mill of 75 stamps. The future policy of the new owners has not as yet been given out. A. L. Collins will look after their interests at Central City. The record of the Gregory-Bobtail to date is over $14,000,000, chiefly gold.

The Rialto mine, between Central City and Black Hawk, which was sold recently, has again changed hands, C. K. Colver transferring to W. H. Davis, trustee of Denver, the property, machinery and buildings, for $40,000. A pool has been organized to work the property and a new shafthouse is to be erected over the site of the old one, and a hoisting plant will be installed. The main shaft is down 550 feet. It has been idle for five years.

The Kelley M. Co., operating the Rialto Extension property, near Central City, are advertising for bids to sink the cage shaft 100 feet deeper.

Denver *Republican*: S. W. Miller of Chicago, who is working the East Whiting on Gunnell Hill, Central City, has a lease and bond on the Straub, Straub Extension and Press claims, also 200 feet of the Ashtabula lode near the East Whiting property. He has also an option on the Huddleston group of five claims in the Eureka district. In the East Whiting mine the vein has been opened in a south crosscut on the 300 level.——Local parties working the Washington Day in Pleasant Valley district, have returns from several loads of ore which gave 35% lead.——Frey & Horner have made a shipment of lead ore from the Hayseed property in Quartz Valley. They have about seventy-five tons of mill rock on the dump. They also have a lot of zinc ore which they will ship to the works at Canyon City.——The County mine in Chase gulch made a shipment of 100 tons of ore to the concentrator for a test. The ore carries lead, not enough to make it a smelting proposition and too much for milling.——E. C. Lindemann is getting the old Stewart mine in Hawkeye district in shape. The water has been lowered and miners are retimbering the shaft. It has been idle twenty-five years.

GUNNISON COUNTY.

(Special Correspondence).—The Cortland M. Co. is now working several claims by a tunnel in McIntyre gulch, about three miles northeast of Ohio City. In the upper working there has been 400 feet of work, and a good deal of high-grade silver-lead ore has been shipped. H. S. Roe, the Mgr. has started a tunnel about 500 feet farther down the hill and is running on the vein. At a depth of 200 feet he has encountered good pay ore in several places. There are two cars ready to ship. The ore is worth about $200 per ton; $20 is gold, the balance silver and lead. Mr. Roe will start a winze in the tunnel and increase his force.

The Raymond mine, which is near the Cortland property, will be started up at once. The mine is said to be in good ore. The Mgr., who has a bond on the property, shipped a car of ore to the smelter, getting returns of $100 per ton. He has means to put a force of men at work and unless all signs fail the Raymond will be a shipper of high-grade lead-silver ore.

The Chloride mine is now working six men and has sent out two cars of ore that will run about $100 per ton in gold. The property is near Ohio City, has a good deal of work done on it (mostly tunnels) and shows up good bodies of ore.

Gunnison, Colo., April 10th, '99.

HINSDALE COUNTY.

Denver *Mining Review*: The streak of gold ore in the Golden Wonder mine near Lake City is looking better.——L. A. Vinton, with three men, has gone up to Red mountain to work on the Bryan lode, where a shaft is being sunk on a porphyry dyke.——T. N. Dall and H. Reppy in the Golden Rule on Hotchkiss mountain have good looking quartz.

LAKE COUNTY.

Leadville Carbonate *Chronicle*: The Humboldt mine, on the northwest corner of Iron hill, is being worked under lease to Hinckley & Co. They are mining in the upper levels, 170 feet from the surface.——The Mahala mine continues to produce 100 tons of sulphide ore from the ore body, near the bottom of the winze. This ore chute is 60 feet in height, and the diamond drill shows mineralization below.——The road is open to the Continental Chief, and ore will be moving from that property. It cost the company $1500 to move the snow.

MINERAL COUNTY.

Creede *Candle*: A few days since workmen grading for a building in the town of Creede uncovered a gold-bearing vein.——A contract has been let by D. L. Motz for another 100 feet of work on the Ballarat at Creede. Recent assays from this tunnel show increased values.——Work has been progressing during the past month on the Mollie S. and considerable ore has been broken. A shipment was made this week.

MONTROSE COUNTY.

Telluride *Examiner*: Thirty teams are freighting ore from the La Sal Copper Co.'s properties in Paradox valley, near Bedrock, and as many more would be employed could they be obtained.

PARK COUNTY.

Park county is doing as much development work as any county in the State at present.

In the district north of Lake George, along the Tarryall and to the west of this stream work has been done all winter.

The Tenderfoot will be a steady shipper within sixty days. The ore is gold, silver and lead, the percentage of the latter being exceptionally large. The vein is in granite. Bids are being received for 500 feet of sinking.

The Tarryall-Midland has made its third shipment, the carbonates netting $35 at Pueblo. The ore is silver and lead, the latter 60%, returns on galena being from $45 to $80 net.

The Redskin has a rich chimney of ore at the 85-foot level. The average run of ore is $40. Iowa people are back of the company.

The Hard-to-Beat mine has a 3-foot vein of galena reached by a tunnel. Hauling will soon begin.

The Copper King, a new discovery in the northern part of the district has malachite and azurite. An assay at 10 feet gave 10% copper.

The Plymouth Rock, down 90 feet, has a body of copper ore which is being sacked for shipment.

RIO BLANCO COUNTY.

G. S. Wedgewood of Omaha has closed a deal for eleven gilsonite claims close to the Colorado line and sixty miles from Vernal,

Utah. The claims have several veins of gilsonite, the crude material running high in carbon. The price paid was about $20,000. He represents a company who are preparing to develop the property and ship the product East.

SAN JUAN COUNTY.

Silverton *Standard*: The Red & Bonita Mountain G. & S. M. Co. have awarded contracts for building the mills at its mines near Silverton.——The shipment of concentrates for March from the Gold King mine at Silverton was thirty-two cars of fourteen tons each.

SAN MIGUEL COUNTY.

The Japan Mines Co. is taking rich gold ore from the Flora, in Savage basin, which, with the Climax and two adjoining claims, was last fall purchased from the Flora G. M. Co. for $50,000. The Flora properties lie next to the Japan group, with which they constitute one of the largest properties owned by one company in the district. Since their purchase the Flora and Climax have been developed and large ore bodies found. In the Japan 3 feet of solid ore is visible, some of which is high-grade, and, shipped to smelters, netted from $750 to $1000 per car. The concentrating plant will be started up as soon as there is sufficient water for milling purposes. The plant has a capacity of sixty tons per day. As soon as the mill is started the force will be increased to 75 or 100 men.

The United States & British Columbia M. Co.'s new mill, one-half mile east of town, is treating from sixty to seventy tons of ore daily. A two-mile bucket tramway connects the mill with the mines in Cornet Creek basin. The vein is from 2 to 8 feet wide. A subsidiary company, known as the Liberty Bell G. M. Co., has been organized to operate this group of mines and mill, while the United States & British Columbia Co. is developing other claims in the district.

The Gold King mine and 40-stamp mill, which was closed down a few weeks ago on account of litigation with the Suffolk-Globe Co., will, it is reported, be started up in a few days.

The trail from the Alta mine, at the head of Gold King basin, to Ophir station is opened, and in a few days the Alta will resume shipping. Stoping ground has been opened, the main tunnel having a depth of 1000 feet, but no stoping has been done. The vein is from 4 to 6 feet wide and carries from 2 to 3 feet of milling ore and from 12 to 20 inches of shipping ore. The vein carries a larger percentage of lead than any other in the county.

A rich body of ore has been found in the lease held by Hall, Randol, Matthews & Rogers on the Silver King, on the same vein and adjoining the Alta. The mineral is said to carry gray copper rich in silver and a high percentage in lead. The streak is from 10 to 12 inches wide.

Ten stamps of the Terrible & Butterfly mill at Ophir Loop are dropping, and as soon as the water supply increases five or ten more will be added. The plant comprises thirty stamps, with concentrating machinery.

Telluride *Examiner*: Rich copper veins are reported discovered at Placerville.

TELLER COUNTY.

London reports the sale there to English parties by W. S. Stratton of the Independence mine at Cripple Creek, and about 100 acres adjoining, for $10,000,000.

A former London cablegram announced that W. S. Stratton had sold his Cripple Creek mine, the Independence, to the Venture Co. of London. The price was not stated, but it is said to be $2,000,000. Local officials of the company refuse to discuss the matter. In '93 the net profits of the mine amounted to $60,000. In the next three years the mine put into circulation $4,000,000 in gold, of which one-half was profit.

Drifts are being driven in two directions on the lead recently cut at 250 feet depth on block 5 of the Mountain Beauty G. M. Co.'s group on the southeast slope of Bull Hill, Cripple Creek. All the ore taken out is saved for shipment. The vein is 4 feet wide.

On the Minnie Belle claim of the Wilson Creek Con. Co., adjoining the Mountain Beauty, the shaft is being sunk to a depth of 350 feet and is now in 325 feet. In the fifth level the ore is the richest.

Up to this time the Magner and Sindlinger lease on the Minnie Belle has operated on the smallest of the fractions that constitute the claim. From four-tenths of an acre nearly $60,000 worth of ore has been taken. The present production is $20,000 a month.

Last month the Wilson Creek Co. purchased the Queen Isabella claim at Cripple Creek which overlapped nearly all of the Minnie Belle and threatened the title to more than three-fourths of the claim. The lessees will extend their operations to the remaining territory covered by the Minnie location.

Victor *Record*: Another strike has been made on the Chance vein and on the E. Porter Gold King in the Philips' lease west of the main workings. —— Work has again been started at the Golconda mine under the management of E. R. Argersinger. The main shaft has been equipped with a hoisting plant of the gasoline type, 22 H. P. The engine is the first of the kind in the district. The shaft is 320 feet deep and it will be sunk to a depth of 900 feet.

Denver *Republican*: The first shipment from the Pride of Cripple Creek since it has been under lease and bond by the Creston, Ia., syndicate, will go out this week. The leasing company has opened a lead at a depth of 165 feet, 18 inches of which carries good pay values.——Work has been resumed on the Ollie on Signal Hill sold to the Creston investors last fall for the sum of $50,000. A contract has been let for 100 feet of shaft.

Denver *Post*: The case of the Roxana Co. vs. the Isabella Co., at Cripple Creek, in connection with the wedge-shaped strip of land between the Cheyenne and Lee claims, which has been the subject of litigation, has been disposed of by the Land Office at Washington in favor of the Isabella Co.

IDAHO.

In the Sixteen to One, at Wallace, the drift is 50 feet from where the ore was first found, and the vein is 9 feet wide—about one-half clean ore and the remainder high-grade concentrating ore.

The reported discovery of molybdenite in the Leslie mine, near Mullan, has created a boom in that mineral, and prospectors are locating molybdenum claims.

MICHIGAN.

At Calumet last Wednesday the Tamarack, Osceola, Tamarack, Jr., and Kearsarge copper mines closed on account of a strike at their stamping mills at South Lake Linden. About 2500 men are out of employment through the strike of 300 men at the mills. The men are not grumbling, being in sympathy with the mill men. The mill men are likely to demand a straight 10% raise before beginning work again.

MISSOURI.

During the week zinc ore sold at Oronoga and Pleasant Valley mines, Webb City, for $52 a ton. Two years ago the price averaged about $20 a ton.

MONTANA.

The latest developments in the Boston & Montana receivership is the refusal of the Great Northern Railway to carry matte for the receiver. Five cars loaded with matte were tendered at Great Falls, which were refused. Suit will be started to compel the Great Northern to carry the matte.

Neihart *Herald*: Over 400 men have left Neihart since the strike began.——On account of the B. & M. closing down at Great Falls, the Lewis and Millard mines at Neihart have suspended shipments of coal to the smelter. This will throw fifty men out of work.

Butte *Inter-Mountain*: The principal news of the week is the resumption of work at the Boston & Montana. During the litigation the ore bins had been emptied and the workmen are now refilling them before shipments are made to Great Falls. The smelter will be ready to treat ore next week. The payroll of the company in Butte amounts to about $85,000 and at Great Falls $25,000 per month. It is probable that the full force will be at work next week.

Virginia *Madisonian*: G. D. B. Turner is operating the Red Bluff mine, at Red Bluff. The shaft has been retimbered to water and the pumps will be started. The work is in charge of G. Hadzor.——Mr. Ramstadter, it is reported, will begin work on the Grubstake, a mine which has produced about $125,000.——A. W. & C. E. Tanner are working the Tilden mine. They have fair ore in sight.

NEVADA.

Unwatering of the Comstock goes on. Drainage is to be facilitated, and when the new elevator gets to work about May 1st the water will be lowered more rapidly. The following is Mgr. Ross's latest telegram: Elevator working steadily. Water in the 1750-foot level winze is 26 feet 10 inches below the station.

Eureka *Sentinel*: Laird & Northey are working the Marguerite mine on Adams Hill north of the Macon City and are getting out high-grade ore. —— F. Quinn is working the Auro-Cyanide claims on Adams Hill, adjoining the Macon City, under lease. The Auro-Cyanide mines have produced $75,000.

Winnemucca *Silver State*: At Dayton the Bull Dog plant, consisting of an engine, hoist and pump, was burned recently.——At Gold Hill Pierson & Davis have men at work screening a test run of rock from the Overman tunnel dump, which will be crushed at the Rock Point mill in Dayton, and, if the returns are satisfactory, the entire dump will be reduced. The dump is composed of quartz.——John Biggs, owner of the Overland mine, near Johntown, leased the property to Washburn & Mills of Gold Hill, and later assigned it to the Bank of California. The bank put a force of men on the mine, whereupon Washburn & Mills hired watchmen to oversee the property. Litigation is threatened.

NEW MEXICO.

Santa Fe *New Mexican*: M. M. Freed has sold his Cabello mountain copper claims to the Fidelity M. Co. of Salt Lake City. There are twelve claims in the group.

Santa Fe *New Mexican*: The Old Abe mill is running day and night on ore from development work. In connection with this a cyanide plant is in operation. The new hoist is now on the way from Alamogordo, the nearest railroad station. The foundation for it is nearly laid. The cyanide plant, owned and operated by the Gumms, is still working.——The company preparing to operate in the Jicarilla placer district has had a survey made, which shows the water sources several hundred feet higher and the line three miles shorter than expected.

Santa Fe *New Mexican*: The Philadelphia M. & M. Co. at Hillsboro has abandoned the cyanide process and adopted the amalgamating process, which has increased the output. ——The Snake group and the Richmond group near Hillsboro are being worked profitably on the lease system.——The Porter mill is running steadily.

Sacramento *Chief*: In Dry canyon, eight miles east of Alamogordo and seven southeast of La Luz, a number of prospects are being developed. The formation is granite and limestone with porphyry dykes and veins of quartz and spar.——Tucker, Varner & Smith have a copper claim near Dry canyon which at 35 feet assays $120 to $180 per ton.

OREGON.

Baker City *Republican*: The bromine-chlorine plant on the Golconda property will be started up the coming week. Its capacity is fifty tons a day, which will be increased to 100 tons within thirty days. There are about 1500 tons of ore on the dump, which will first be treated.

Baker City *Epigram*: The Chicken Creek mines are to start up with three giants under the superintendency of W. A. Weatherly.—— It is reported another strike has been made at the Collateral of the Virtue Co.——Work will be commenced on the 25th inst. on the 125-mile mining ditch which runs from South Burnt river near Unity to near Malheur City.

SOUTH DAKOTA.

Deadwood *Mining Review*: Quartzite has been struck in the Mark Hanna ground in Two Bit at a depth of 55 feet. The quartzite carries value. The ground adjoins the Monarch, from which shipments of ore are being made.——The Gilt Edge Co. is sinking a shaft on the Dolcothe claim, east of Hill City, which is 175 feet deep. The vein contains gold the same as the Holy Terror ore and the company is preparing to sink to the 300 level.——The St. Elmo mine and mill near Hill City have started up again. There is a vein of free milling ore in the mine which gives good assays.——The Spokane mine near Hill City is being worked by the Crown Hill M. Co. and the ore, which contains lead and silver, is being hauled to the concentrating plant of the Harney Peak Tin Co., east of Hill City.

Hill City *News*: The Blue Lead copper mine, near Sheridan, is to be reopened under the Harding bond. A tunnel will be driven in from the foot of the hill, 1000 feet from which crosscuts will be run. The surface deposit is over 100 feet in width, consisting of black slate and quartz, in which occurs green carbonate. Black oxide of copper also occurs in the slaty portions.——Rossiter Bros. will start the cyanide plant at Deadwood, to treat ore from their mines in Blacktail gulch.

UTAH.

The antimony mines of Garfield county are being worked, regular consignments of ore being made to the Eastern and Western market. The last consignment was thirty tons.

Eleven teams left Ferron recently loaded with gold-bearing rock from the mines, thirty-five miles southeast of Ferron. This is the first shipment and it is now on the way to Price, the nearest railroad point.

Hon. J. H. Conrad has purchased the Massachusetts mining property at Park City, Utah. While prospecting from the original workings he will begin a new shaft.

Mercur *Mercury*: The Mercur made the first shipment of gold bullion from its new refinery Wednesday, amounting to $24,000.

Salt Lake *Tribune*: Recent sampling of the Petro at Bingham shows large bodies of copper ore. This was recently worked as a lead-silver mine.——If negotiations now in progress result favorably, work will be resumed on the Atlas group, eight miles south of Milford, which has been abandoned for fourteen years, but at one time a large producer of silver and lead ores.——A strike of copper ore has been made on Granite mountain, Deep Creek district.——It is reported that the Ganyard placers at Bingham, comprising seven claims, is to be incorporated by Salt Lake men.—— The reopening of the United States M. Co.'s property at Bingham has been commenced and when in full blast it is not unlikely that 1000 names will appear upon the payroll. There will be enlargement of the main tunnels of the Old Telegraph and Old Jordan which are to have a double track, the cars to be drawn by mules until an electrical plant is installed. Air compressors are also to be put in.

Salt Lake *Tribune*: The engineers at the Daly-West quit without notice a few days ago. They had been working twelve-hour shifts and under the new law demanded eight-hour shifts, which was agreed to, but the miners refused to allow a strange engineer to lower them into the mine.

Eureka *Republican*: Mgr. W. Lawrence of the Star Con., south of Mammoth, reports the shaft down 480 feet. The objective depth is 700 feet. They are also sinking a winze on the 400 to tap the ledge.——At the South Sunbeam, of Silver City, the shaft is now down 175 feet, with a crosscut of 20 feet, and showing ledge about 300 feet.——Supt. W. Morris reports that assays from the 100-foot level of the Orient, in West Tintic, show 13% copper, 22⅔ ounces silver and 67 cents gold.——Supt. W. Hoffman reports the opening of an ore body in the White Cloud mine, near Diamond. Specimens of galena have been brought in, some samples of ore carrying considerable gold and silver.

WASHINGTON.

A contract is to be let to sink 50 feet on the Altura at Republic.

Work on the drift in the Trade Dollar, at Republic, has been shut down and a winze started on the pay shoot near the entrance to the drift. It is now about 12 feet in depth and is showing up fine ore.

Rossland *Miner*: No. 4 tunnel of the Republic mine, has been started. It will be 2200 feet long and will tap the ledge at 600 feet deep. The Republic is running a full force.

FOREIGN.

AUSTRALIA.

Bendigo last year produced one-fourth of the total output of gold of Victoria. Since 1851 this field has produced 15,765,041 ounces, of a monetary value of £67,060,164.

BRITISH COLUMBIA.

Supt. H. A. Ross of the Bismarck, Standard No. 1, Blue Bird, Nevada, Tip Top and MacKenzie, eight miles from Grand Forks on the west bank of the north fork of the Kettle river, says they are down 30 feet in the Tip Top and No. 1, which adjoin, and have 4 feet of ore.

The Lucky Jim mine near Kaslo has been purchased by an English syndicate and development work is to begin at once. The purchase was made by A. R. Browne, representing English capitalists who control a chemical process for extracting zinc from ore. The Lucky Jim is rich in zinc and the new owners will ship the ore to England for treatment. The mine has been developed to some extent and has a tramway. E. C. Ward, formerly of the Whitewater, is in charge.

The Stemwinder tunnel in the Kootenay is now in 80 feet, in ore its entire length. A south drift run from this tunnel 30 feet is also entirely within the ledge. Both were run to find the walls, but have failed so far.

During March the St. Eugene and Lake Shore mines at Moyie shipped twenty carloads of ore to the Trail smelter. The total value was $32,960, net profit $16,000. The St. Eugene is credited with 370 tons and the Lake Shore with 42 tons.

A rich strike of copper ore is reported on the Highland King on Diorite creek, twenty-eight miles from Fort Steele, owned by Kleinsmith, Schagel & Grez. The owners have a force of men developing. There is a good showing of ore of a high grade.

The crosscut tunnel being driven on the Miller Creek is now in 232 feet and quartz stringers are beginning to come into the face of the tunnel. For some time mineralized rock appeared in the workings, carrying lead, zinc and iron, which is taken as an indication that the ledge is only a few feet away.

At the Mascot mine, in twenty-six days, 174 feet were driven in No. 3 tunnel, making the record for work in this camp.

The Stemwinder is working ten men. A crosscut is being run from the shaft both ways at the 200-foot level. Better values are now showing.

It is said that work will soon begin on the Smuggler, which has been idle some time.

The Evening Star at Rossland will soon be a regular shipper; at present the ore is allowed to accumulate until the roads get in condition when it will all be shipped to the Trail smelter.

The Porto Rico mine is one of the productive mines of Ymir camp. A 10-stamp mill installed last winter has been in operation two and a half months and $30,000 in gold has been extracted. The development of the mine consists of three tunnels. The upper is in 675 feet. At the breast the vein is 3 feet wide. No. 2 tunnel is in 280 feet and has 290 feet of backs. The tunnel is on the vein. No. 3 tunnel is in 540 feet. The vein varies from 14 inches to 5 feet in width. An upraise has been made connecting No. 3 tunnel with No. 2, a distance of 155 feet. It is proposed to run a fourth tunnel below No. 3 for a distance of 1000 feet. The vein lies between walls of porphyry and consists of white quartz heavily mineralized with pyrite.

Ashcroft *Mining Journal*: A party of Americans and Englishmen have started north for the head of Peace river by way of Fort McLeod, where they say they have a large quartz ledge being developed by miners. The headquarters of the company is in Chicago. They also have mines on Great Slave lake.

Nelson *Tribune*: The Slocan Star is putting the mill in shape to resume operations about the 20th. A number of cars of ore taken out during the winter will be shipped.—— Throughout the Slocan the trails and wagon roads are breaking up. For this reason the Whitewater has discontinued shipments.—— Arthur Bacon, who has been in the Slocan purchasing zinc ores for an English smelter has about 1400 tons of ore running 15% to 35% zinc.——The Last Chance in the Slocan is keeping up its record of one car per day which nets from $1200 to $1500 per car.——G. Alexander, owner of the Antoine near Sandon is preparing to start a long tunnel on the Best Basin side to tap the lead at great depth.—— The Tennessee, Iowa and Iron Chief claims owned by the Hamilton & Rossland G. M. Co. near Ymir are to be developed.——It is understood there is a deal on for the Wilcox on Wild Horse creek; it has two ledges, principally galena.——Work on the Elise in Ymir will be continued in the drift along the hanging wall, now in 65 feet. The shaft and the tunnel have been connected at the 125-foot level.—— It is reported that work on the Jubilee mine will be resumed; it is on Jubilee mountain near Ymir and is operated by the Mountain Goat Co. The tunnel is in 200 feet and it will be extended to the ore body.——A representative of French capitalists has been looking up the Ymir district.

Rossland *Miner*: The War Eagle has just shipped fifteen cars of ore or a little over 262 tons. The shipments of the company since Sunday have amounted to 472.5 tons.

Rossland *Miner*: The Rambler-Cariboo M. Co. near Rossland will put in a 5-drill compressor. The present plant consists of a boiler, engine, hoist and three steam drills. W. H. Adams is Mgr.——The ore shipments for the year up to April 15 from Rossland aggregate 24,855 tons, principally from the War Eagle, Le Roi and Iron Mask.

MEXICO.

A mining disaster in which twelve men lost their lives is reported from Sierra Mojada, in the State of Coahuila, fifty miles south of Presidio, Texas. An explosion of foul gas occurred in the Veta Rica silver mine, and before all the miners got to the surface the timbers took fire, barring exit.

NEW ZEALAND.

The New Zealand Government is assisting the prospecting of the country by the erection in suitable localities of prospecting plant and all necessary appliances to enable pioneers to test the ground.

SOUTH AFRICA.

South African *Mining Journal*: The Robertson shaft of the Knight's Deep makes 300,000 gallons of water daily, raised by electric pumps. This is from the shaft only and a large increase is looked for from the levels. The Connor shaft is making 600,000 gallons daily and an increase is looked for. This vast volume of water is considered a valuable asset. To utilize this supply of water to advantage, it is intended to lay a pipe line from the Knight's Deep shafts to a new reservoir now being constructed. This reservoir will be connected with the different boiler plants and batteries which need water.

Personal.

M. P. DALTON lately returned to Denver from Boston.

T. A. RICKARD, State Geologist, is visiting the Comstock, Nevada.

EX-GOVERNOR ADAMS of Colorado is in Arizona looking after mining interests.

F. A. WOODS, Mgr. Last Chance mine near Sandon, B. C., is visiting in California.

G. W. PARSONS has returned to the Alta mine, Alleghany, Cal., from San Francisco.

JOHN SHAW has taken charge of the 20-stamp mill at the Hathway mine, near Ophir.

JNO. HAYS HAMMOND has returned to South Africa from London. He will remain three years.

P. C. WAITE has gone from Bozeman to Silver Star, Montana, to superintend operations there.

R. D. HUNTER, Denver Mgr. Sullivan Machinery Co., recently returned to Denver from Chicago.

H. B. MEECH is at Revelstoke, B. C., for the B. & B. C. C. M & S. Co., which is building a smelter there.

ARTHUR PEARSE of London was in San Francisco last week arranging for a Siberian mining expedition.

A. M. MCDONALD of Tuolumne county, Cal., has been appointed Supt. Lily gold mines, in Madera county, Cal.

E. L. BALLOU, of Igo, Cal., goes to Pony, Montana, to take charge of mining operations for a company there.

F. MCMILLAN of San Francisco has returned from an extended tour among the mines of central California and Mexico.

E. BENT has returned from Johannesburg, S. A. R., to Prescott, Ariz., and is investigating the Amazon group near Prescott.

L. VON ROSENBERG, a New York mining engineer, is is San Francisco, returning from inspection of Arizona mining properties.

C. A. SPRECKELS of San Francisco was a recent visitor in Deadwood, S. D., near which city he has large coal interests in the Wyoming field.

W. J. CLARKE, Gen. Mgr. General Electric Co.'s foreign department, has gone to Europe for four months to complete organization of his department.

BERT HOLDEN of Salt Lake, Utah, has accepted the position of managing director for the United States M. Co., with headquarters at Cleveland, Ohio.

EDWARD RAY, formerly Supt. Ibex mine at Leadville, Colo., is now in a similar position on the Independence Town & Mining Co.'s properties in Cripple Creek district, Colo.

M. H. TWOMEY of Phœnix, Ariz., is in Cochise county, Ariz., where he has mining interests. He leaves soon for Boston to arrange for marketing turquoise found near Pearce.

MR. H. T. HESSELMEYER, of Cobb & Hesselmeyer of San Francisco, has returned from Marysville, Cal., where he had been inspecting an Archimedean dredge in the Yuba river.

H. P. GORDON, who has been developing some Del Norte, Cal., properties, goes to Pandi gold basin, Alaska, this week to resume superintendency of the New York M. Co.'s property there.

PROF. W. L. WATTS of the State Mining Bureau, who has for the past three years been examining southern California oil deposits, etc., has returned to San Francisco and is making up his report.

ROBT. H. POSTLETHWAITE has returned to San Francisco from visiting the four Risdon dredges he recently placed on the Feather and Sacramento rivers. They are successful, having paid from the start.

Mr. J. P. CORBUS is at present superintending the operations of the Alaska-Treadwell M. Co. at Douglas Island, Alaska. Mr. Robt. P. Duncan, the late Supt. there, died at Phœnix, Arizona, on the 14th inst.

GILBERT MCM. ROSS, Mgr. Comstock Pumping Association and Supt. Ophir and Mexican mines, is in San Francisco, and speaks encouragingly regarding the favorable progress of the deep level pumping which is making progress commensurate with the magnitude of the work and the difficulties necessarily encountered.

FRANKLIN FARRELL now states that while he had accepted the position of president of the United Verde Extension C. Co., Jerome, Arizona, as previously published, he has reconsidered his determination and will not accept. He also says he has sold all his Parrot, Montana, interests and resigned as president and director.

LIEUT.-GOV. J. H. NEFF, Pres. California Miners' Association, has appointed the following committees to take charge of the arrangements for the convention of the American Institute of Mining Engineers in San Francisco next October: Executive Committee—W. C. Ralston, chairman; S. B. Christy, C. H. Lindley, C. G. Yale, W. S. Keyes, T. Mein, E. H. Benjamin, J. F. Halloran, E. A. Belcher, A. A. Watkins. J. J. Crawford, F. A. Leach, H. T. Power, Placer; W. H. Bourne and A. D. Foote, Grass Valley; F. Zeitler and B. S. Rector, Nevada City; W. B. Hammon, Butte; W. F. Detert, Amador; F. F. Thomas and M. B. Kerr, Calaveras; D. R. Oliver, T. Hender and F. M. Wilmans, Tuolumne county; H. E. Picket, El Dorado; M. E. Dittmar, Shasta; C. C. Derby, Santa Clara, and P. A. Buell, Stockton. Reception Committee—H. T. Gage, J. D. Phelan, I. M. Scott, D. M. Burns, A. J. Ralston, W. W. Montague, R. S. Moore, J. Spiers, Jr., B. T. Lacy, T. Heushaw, S. J. Hendy, H. T. Lally, S. Mooney, G. H. Wallis, J. Sloss, E. Coleman, A. Carrigan, J. M. Wright, J. F. Davis, J. S. Bownell, G. Johnson, J. Bermingham, J. Sonntag, W. A. Doble.

Industrial Notes.

The Utah Pacific Railroad is completed to within forty miles of Pioche, Nevada. It is expected that the line will be extended there by July 1st, '99.

—Ass't Gen. Mgr. McKercher of the Mexican Central says the Guadalajara branch will be built south and west of Manzan, Pacific coast, a distance of about 300 miles.

—Last week the Colorado Midland Railroad blockade west of Leadville, Colo., was broken and through traffic, which had been interrupted for seventy-seven days, was resumed.

—The Blue Lakes, Cal., Co. has completed its power line to Stockton and has bought $10,000 worth of machinery for use at its reservoir site. The plant at Blue lakes is ready for operation.

—Speyer & Co. say that over 91% of the bonds and 99% of the stock of the Central Pacific Railroad Co. have been deposited under the plan and agreement of readjustment, dated February 8th, '99.

—At Denver, Colo., the Denver & Northwestern Railway is to be constructed by German and Gould capital, and run in connection with the Missouri Pacific, to be built from Denver to Boulder, Ward and Steamboat Springs.

—Denver reports an unauthenticated deal whereby the Midland Terminal Railway Co., the Florence & Cripple Creek Railway and the Florence Reduction Works at Florence have been sold to a London syndicate for $8,000,000.

—Canada announces official intention to lay a cable across the Pacific ocean from Vancouver, B. C., to Australia, the cost to be borne by the Governments of Great Britain, Canada and the Australian colonies. A U. S. line to Hawaii and the Philippines, Japan and China is an existing necessity.

—The Union Pacific gravel mine at Sherman, Wyoming, is in charge of E. P. Edwards of Illinois. Two steam shovels and a large force of men will be employed this summer. The shipments will aggregate 5000 tons per day during the entire season. A rotary plow is clearing the gravel pits of snow and ice.

—The Northwest Railway expects by June 15th to have twenty miles completed from Huntington, Or., to Tramway Junction, the shipping point for the Peacock mine, and by August 15th to have seventy-five miles completed. The line runs up the Oregon side of the Snake river and is projected to tap the Seven Devils copper district.

—The O. R. & N. Co.'s steamship Lennox cleared this week for Oriental ports with the largest cargo of flour ever put afloat on the Pacific coast—47,358 barrels. The Lennox is the third steamer to leave Portland within a month, and the combined Oriental flour shipments on the three steamers were 105,244 barrels, over three-fourths of which was for Hongkong and the remainder for Japan ports.

—The Russian Minister of Railroads announces in a special dispatch from St. Petersburg that when the Transsiberian railway is completed it will be possible to go around the world in 33 days, as follows: Bremen to St. Petersburg, 11½ days; St. Petersburg to Vladivostock, 10 days; Vladivostock to San Francisco by steamer, 10 days; San Francisco to New York, 4½ days; New York to Bremen, 7 days.

Books Received.

"*Practical Notes on the Cyanide Process;*" octavo. 202 pp., illustrated; Francis L. Bosqui, New York and London; price, $2.50. This volume treats the cyanide process in a thoroughly practical and comprehensive manner, giving many illustrations and details of construction, which must be of value to all engaged or interested in cyaniding of ores. Considerable space is devoted to South Africa and New Zealand, but the greatest amount is given to the operations in the United States.

"*Stevens' Mechanical Catechism;*" octavo, 336 pp., gilt, illustrated, interesting and thorough, plain and easily understood. The steam engine is thoroughly explained with all its modern attachments and improvements, slide valves, safety valves, injectors, pumps, steam gauges, lubricators, eccentrics, link motion, indicator, etc. Traction engines, etc., are treated in a special chapter. The manufacturing of ice, refrigeration machines, brine and direct expansion systems are treated exclusively; also, the machine shop, electric plant, house wiring and electric heating. Silk cloth, price $1; Laird & Lee, Chicago.

Trade Publications.

The largest and in some ways the finest trade publication received this month is the illustrated book issued by W. T. Garratt & Co., 138-142 Fremont St., San Francisco. It is 7¼x10 inches, bound in gold and brown, printed on 120-lb. paper and profusely illustrated. The first 100 pages illustrate and describe the hydraulic and pumping machinery manufactured by W. T. Garratt & Co., in each case details being furnished as to dimensions, cost price, with such description as would naturally be asked for by probable purchasers. The next 265 pages of the book are devoted to similar illustrated description of all manner of steam goods, tools and requirements of steam fitters and engineers. The remainder of the 402 pages treats of bells, gongs and gong fittings, and is an encyclopedia on those subjects. It was from the W. T. Garratt foundry that the first bell cast on the Pacific coast was turned out in 1851, and ever since the firm has been causing considerable noise in the world, its bells going everywhere, whether in church steeples, ranch and mine use, on locomotives or in engine rooms. The volume is the result of considerable labor and expense and is just issued. It will be sent to any address on request.

Catalogues.

In our weekly talks on catalogues comes up this issue notice of a booklet—No. 169—issued by the Ingersoll-Sergeant Drill Co., 26 Cortlandt St., N. Y. City, treating of air compressors. It is 3x5 in., 24 pp., an unpretentious publication, but worthy of notice as refuting the idea that a big pamphlet is necessary in this connection. The booklet gives considerable information on air compressors, with full page illustrations, and enumerates 162 separate and distinct uses of compressed air.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 11, 1899.

623,068.—STUMP PULLER—E. M. Bliss, Tacoma, Wash.
622,793.—SIDEHILL HARROW—G. A. Brockhurst, Orinda Park, Cal.
622,887.—CLOCKS—S. G. Button, Hollister, Cal.
622,883.—BOTTLE WASHER—Cobb & Dyer, Phœnix, Ariz.
622,890.—ROLLING GATE—E. E. Gustin, The Dalles, Or.
623,084.—BICYCLE LOCK—S. C. Houghton, S. F.
623,021.—SHADE TRIMMER—D. H. James, Albany, Or.
622,954.—SHINGLE SAW—S. T. Johnson, Trinidad, Cal.
622,807.—CARD HOLDER—Robt. Joy, S. F.
623,088.—ORE CRUSHER—C. C. Lane, Los Angeles, Cal.
623,025.—MINER'S PICK—J. B. Lucas, Valley Springs, Cal.
622,818.—PLOW DRAFT—W. S. McClarren, Redlands, Cal.
623,030.—DOOR HANGER—A. Newell, Pasadena, Cal.
622,707.—WRENCH—E. Olson, Seattle, Wash.
622,823.—SLIDING DOOR—D. Schuyler, San Diego, Cal.
622,827.—MECHANICAL MOVEMENT—T. S. Smith, Los Angeles, Cal.
622,748.—RHEOSTAT—W. H. Woodman, S. F.
622,937.—FUIT CLEANER—B. B. & J. H. Wright, Riverside, Cal.
30,526.—DESIGN, EGG HOLDER—W. P. Murphy, Willowglen, Cal.

WANTED—SITUATION BY A PRACTICAL MILLMAN AND ASSAYER.

Would go anywhere. Best of reference. Address F. B., care of Mining and Scientific Press.

WANTED.—POSITION BY MIDDLE-AGED man who can install, run and keep in repair steam, electrical, or mining machinery. Can also do office work and assaying if required.

Address W. H. K., McCloud, Cal.

SITUATION WANTED.

Have had over twenty years' of practical experience in mining, milling, and erecting machinery; thoroughly up to date in working all kinds of ore by the latest methods; can handle men to the very best possible advantage. Will accept of a position to manage a mine, mill, or erect any kind of mining machinery. The very best of testimonials furnished as to abilities, integrity, etc. Address Experience, care Mining and Scientific Press.

WANTED.

Capital to Handle Extensive Gold Mines.

JAMES ARTHUR, Cornucopia, Oregon.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SIDE HILL HARROW DRAFT ATTACHMENT.—Geo. A. Brockhurst, Orinda Park, Cal. No. 622,793. Dated April 11, 1899. This invention relates to a draft attachment for harrows, and is especially designed for harrows which are used in cultivating lands upon side hills or in other sloping positions where the harrow is drawn over the land in the line of the slope. It consists essentially of a bar interposed between the harrow and the team, the traveler movable upon the bar with clamps or stops adjustable with relation thereto to determine the movement of the traveler upon the connecting bar. When harrows are hauled transversely along inclined land or side hills, the tendency of the harrow is to continually slide down below the line of draft and travel, and this is counteracted by the use of the present device.

CARD HOLDER AND EJECTOR.—Robert Joy, San Francisco, Cal. No. 622,807. Dated April 11, 1899. The object of this invention is to provide a holder for visiting, business and other cards which it is desirable to carry in considerable numbers, so that they will be kept clean, and in conjunction with this of a means for delivering and ejecting cards from the holder one at a time. It consists essentially of a card-containing chamber with springs fixed to the top, and pressing upon the surface of the cards so as to maintain the lowermost one constantly in contact with the bottom of the case. A fulcrumed lever having a push plate fixed to its long arm is adapted to engage the rear edge of the lowermost card, and a second lever lying along the interior of one side of the case is fulcrumed near one end and has the opposite end engaging the short arm of the first named lever. A press button or projection extending through the side of the case serves for the application of power to the levers and through these the ejector plate is actuated to force out the single card. As soon as the button is released, a spring returns the parts to their normal position.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

Mining Properties,

Prospects and Partially Developed Claims at Low Figures, Near Good Ore Market.

Also a 50-foot ledge, developed. Ore runs $4 and upwards; free milling. Can be quarried. Water right accompanies.

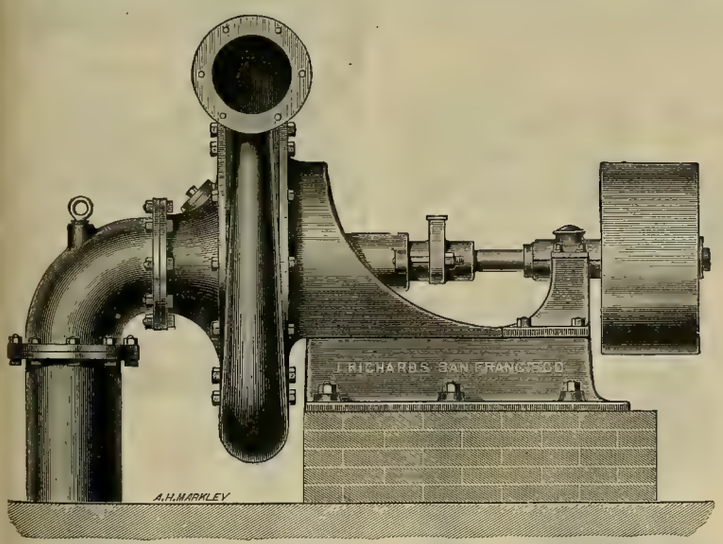
THE MOST WATER FOR THE LEAST MONEY!



For low lifts and large volume of water a Centrifugal Pump cannot be excelled.

We make the RICHARDS PATENT CENTRIFUGAL PUMP. Single suction, consequently less tendency to churn. Perfectly balanced runner. Protected bearings. Removable side plates. Accessible runner. Runners made of diameter to suit the lift. Will not churn at high speed.

Our 1899 catalogue tells about over fifty different kinds of pumps. Free to those interested.

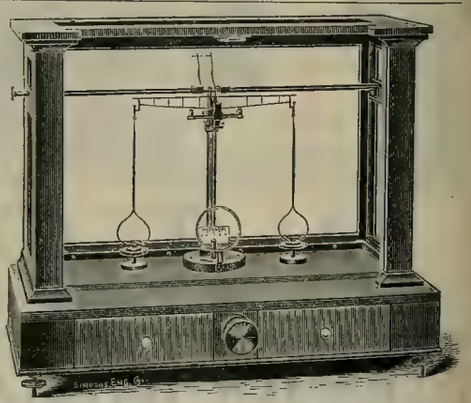
The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to



No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Penghana, Tasmania.

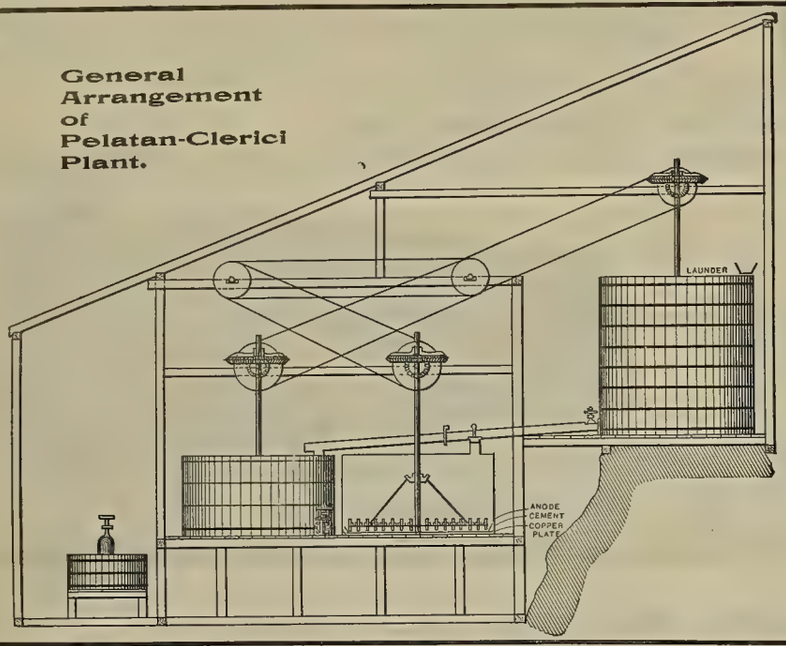
MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves more than 85 per cent by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge.

Simplicity. Economy. Efficiency.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.

(SEE PAGE 445.)

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

RECEIVED FIRST PREMIUM.

THE MAIT DRY GOLD SAVER

Received first prize at Agricultural Fair 1897 in Los Angeles over some dozen competitors, and has been used in southern California in various mining districts with success. The materials used for the construction are of the best. It is well bolted (not nailed) and screwed together. The woodwork is of spruce and poplar; castings, iron and brass; linings, galvanized iron, heavy quality; riffle screen, No. 70 mesh, brass wire; hopper screen, ¾-inch mesh, well secured; fans, galvanized iron, neatly painted and well varnished. It can be easily taken apart and packed, convenient for shipping to any part of the country. If you are interested investigate by writing us for prices and our illustrated descriptive circulars. WHITE, ROGERS & CO.,

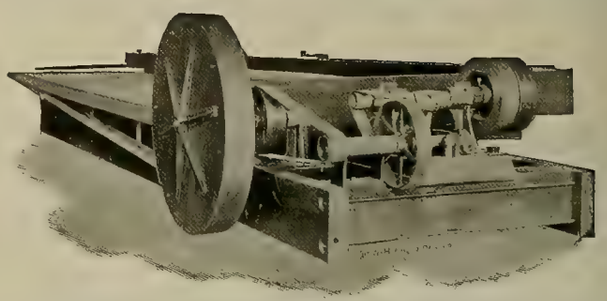
Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

An Improvement in Modern Stamp Mill Practice.

GLOBE BATTERY STEM GUIDE.

PATENTED AUGUST 24, 1897.
RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.
Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary.
No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.
Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.
Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far **do not show any wear either on the Guides or the Stems.** They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. **It is our intention to replace all of our Guides with those of your make,** and I cheerfully recommend them to any one desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

Assessment Notices.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1899, an assessment (No. 130) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the fourteenth day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1899, an assessment (No. 9) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 1st day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California. Office hours from 1 to 3 P. M.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of April, 1899, an assessment (No. 24) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

HEAD CENTRE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tombstone Mining District, Cochise County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1899, an assessment (No. 7) of twenty (20) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of May, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

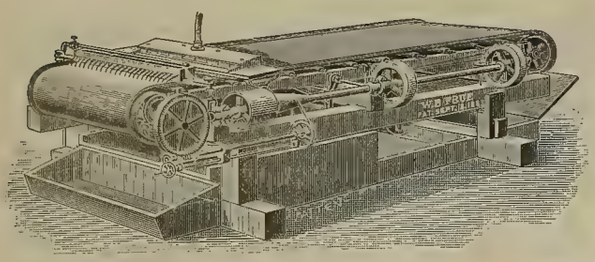
FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

J. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.,

132 MARKET STREET, (Successor to Adams & Carter.) SAN FRANCISCO, CAL.

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leibers.

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard. We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

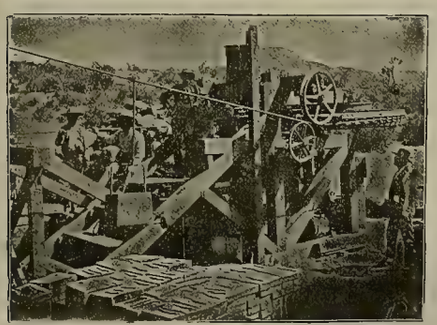
Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

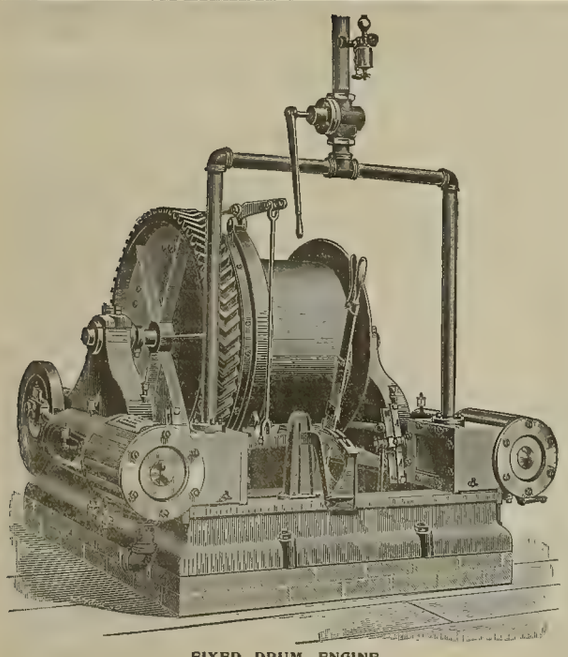
A COMBINED POWER-SHOVEL AND CABLEWAY. .....Ask for Circular.....

Cableways, Double Rope Tramways, Wire Rope Transmissions,

Incline Planes, Logging Machinery, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 330 Market St., San Francisco, Cal.



FIXED DRUM ENGINE.

PARKE & LACY CO.,

21 and 23 FREMONT STREET, SAN FRANCISCO, CAL.

Hoisting and Pumping Machinery

...FOR...

MINE PROSPECTING AND DEVELOPMENT.

SOLE AGENT FOR THE

Ingersoll-Sergeant Air Compressors and Rock Drills.

LICENSEE FOR THE MANUFACTURE AND SALE OF THE

Ropp Straight Line Furnace for Roasting, Chlorinating and Desulphurizing Ores.

Huntington Centrifugal Roller Quartz Mill,

Simmons Ball-Bearing Hydraulic Giants, Paul Ball Mill.

WE CARRY IN STOCK

Horizontal, Vertical and Portable Engines and Boilers, Rock Breakers, Cornish Rolls, Pulverizers, Concentrators, Ore Feeders, Hoisting Engines, Horse Power Hoisting Whims, Water Wheels, Steam Pumps, Ore Cars, Wire Rope, Ore Buckets, Water Buckets, Skips, Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR

Manganese Steel Shoes and Dies.

KNOWLES PUMPS AND PULSOMETER PUMPS.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrating and Stamp Mills.

to be taken from the Library. ****

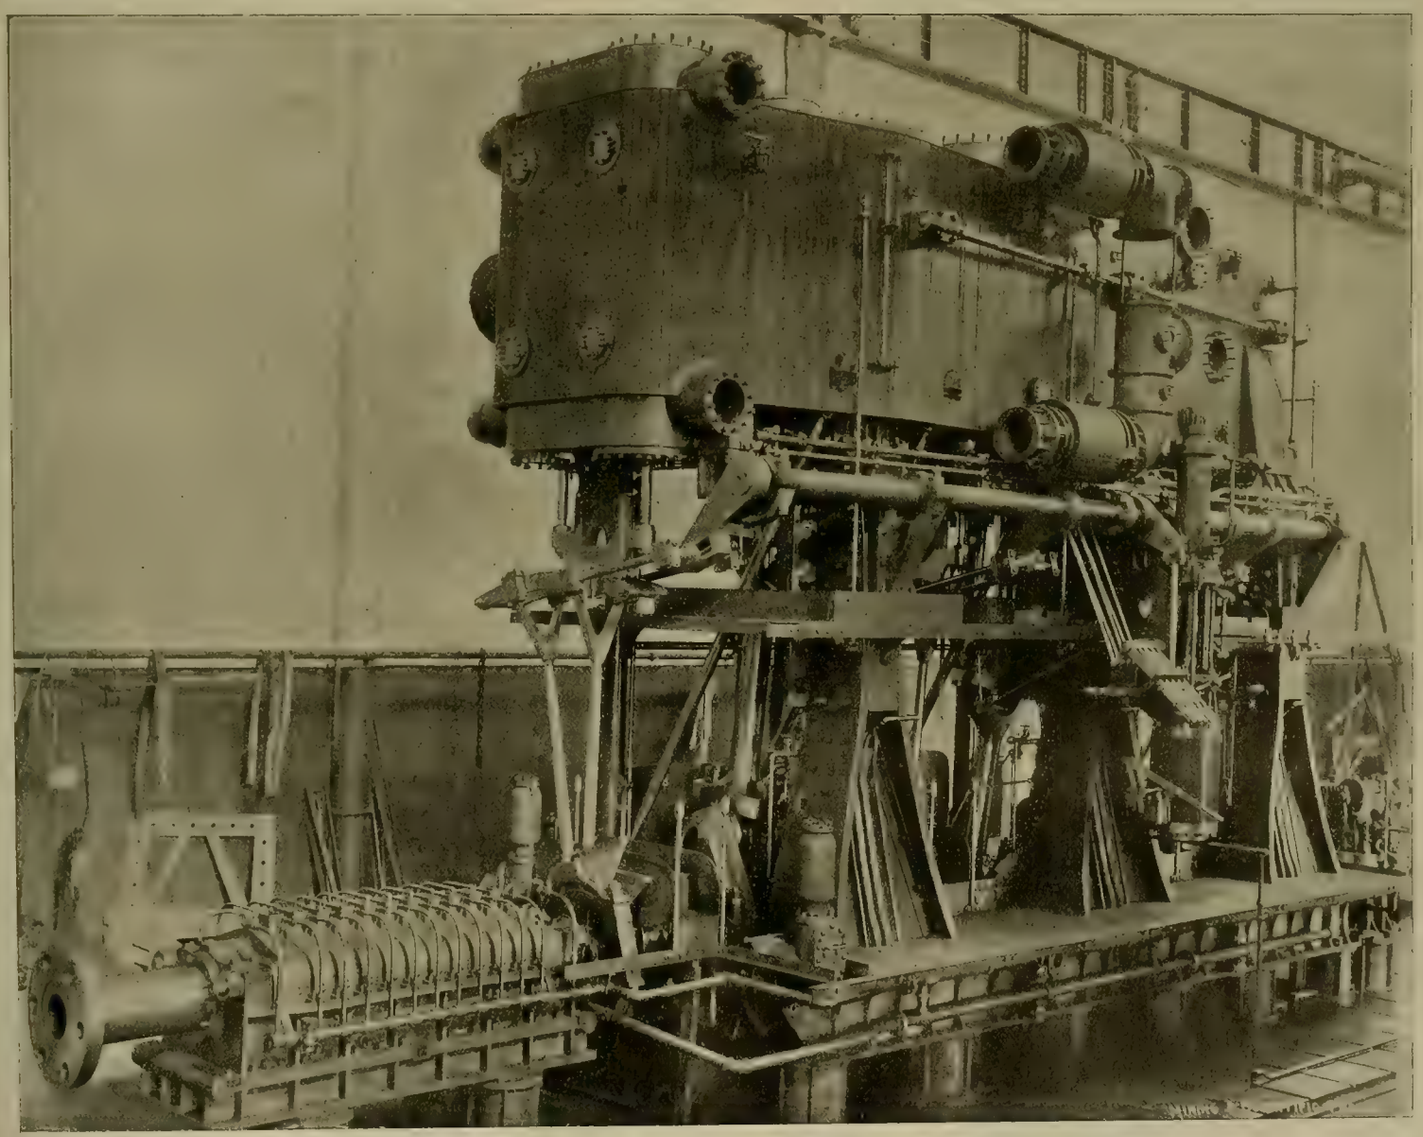
AND PACIFIC ELECTRICAL REVIEW.

No. 2025.—VOLUME LXXVIII. Number 17. SAN FRANCISCO, SATURDAY, APRIL 29, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

One of a Battleship's Engines.

To the fleet of great American battleships built by the Union Iron Works, at the Potrero, San Francisco, are being added two more—the Wisconsin and the Ohio. The former was recently launched, and, under the supervision of Mr. Geo. W. Dickie, is now receiving the additional requirements that will enable her to go out, if necessary, on a career similar to her distinguished sister ship, the Oregon. The total length of the vessel on load water line is 368 feet, with a normal displacement of 11,525 tons and a maximum displacement, with all ammunition and stores on board, of 12,325 tons. The maximum indicated horse power has been estimated at about 10,000 and the probable speed at 16½ knots. Her armament will be modern in every particular, the main battery consisting of four 13-inch breech-loading rifles and fourteen 6-inch rapid-fire guns. The armor belt will be 16½ inches thick at its thickest part. The vessel is extremely well protected in the event of rupture of the outer skin or injury in battle, being divided into between 200 and 300 water-tight compartments, both for the accomodation of the motive power and for storage purposes. These compartments are all provided with pipes connecting with powerful steam pumps, for the purpose of removing any water that may reach them. Ample provision has been made for flooding all the ammunition rooms in case of fire on board the vessel. The very necessary feature of supplying fresh air and regulating the temperature of all compartments of the vessel, has received careful consideration. Special pipes or ducts connected with powerful blowers afford ample circulation of fresh air by means of ventilators extending some 20 feet above the ship's deck.

The propelling equipment of the vessel consists of two sets of triple-expansion, twin-screw engines, each in its own separate water-tight compartment. Herewith is presented an illustration of one of her engines, as set up in the shop, engraved from a photograph expressly prepared for this article. The collective i. h. p. will be about 10,000, the engines operating at 120 r. p. m., with a stroke of 4 feet. The single-ended cylindrical boilers are eight in number, each 15½ feet in diameter by 9 feet 11½ inches long. The total grate surface is 685 square feet, with 21,200 square feet of heating surface and a pressure of 180 pounds. These boilers are placed in four separate water-tight compartments.



ONE OF THE TRIPLE-EXPANSION ENGINES OF THE U. S. BATTLESHIP WISCONSIN.

The auxiliary equipment consists of some eighty odd engines, for the various services on board the battleship. The cranes for handling the boats, the deck winches, pumps, windlass and steering gear are all operated by steam. The introduction of these auxiliary engines will reduce manual labor to a minimum, greatly conducing to the development of the crew in their special duties and rendering the vessel first-class in every particular.

The ship is also provided with a secondary battery consisting of sixteen 6-pound rapid-fire guns, four 1-pound rapid-fire guns, two Colt guns and two field

TABLE OF CONTENTS.

ILLUSTRATIONS.—One of the Triple-Expansion Engines of the U. S. Battleship Wisconsin, 453. Latest Mining and Metallurgical Patents, 458. One of the Triple-Expansion Engines of the U. S. Battleship Illinois; Formation Lying East of Zaca Creek, Santa Barbara County, Cal., 460.

EDITORIAL.—One of a Battleship's Engines, 453. Mineral Products of California for 1898; Naming New Locations After Well-Known Mines; Failure of an Arizona Mining Scheme; Mining Location Blanks, 454.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 461-2-3.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 474.

MISCELLANEOUS.—Concentrates, 455. Mexican Methods of Mine Management and Operation, 456 The Discovery of Acetylene Gas; A Great Drawback; The Pneumatic Cyanide Process, 457. Latest Mining and Metallurgical Patents; An Official Test of the Eophone; To Consolidate Several Large Copper Producers; A Problem in Manufacturing Operations; Affecting British Industries, 458. Some Experiences of a Working Miner; Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 459. The Genesis of Petroleum and Asphaltum in California; Composition of Acetylene; Compares Annual Reports, 460. Recently Declared Mining Dividends; California Mining Incorporations, 474.

THE practice among prospectors of naming new locations after well-known mines is a bad one and should cease, as it leads to much confusion in the identification of property and really subserves no useful purpose. The idea probably is to borrow a little of the glory which attaches to a successful mine, but an original name would be far more appropriate.

AN Arizona paper in announcing the second failure in an Arizona mining scheme of a company of St. Louis, Mo., Germans says: "Neither pains nor money were spared to make the second venture a success, about $40,000 being expended. The mill contains ten 1000-pound stamps and two vanners, engines, boilers and buildings, all complete, but the ore is barren, hence the shut-down." It seems a little strange, to say the least, that the fact of the quartz being barren was not discovered sooner. This is probably a practical illustration of the manner in which history repeats itself.

Mining Location Blanks.

Much of the uncertainty as to the proper method of procedure which appears to be experienced by many prospectors desiring to locate mining claims might be overcome, and all essential requirements made plain, by providing a location blank, which, in plain language, stripped of all unnecessary verbiage and confusing legal terms, sets forth every essential requirement of both Federal and local laws; and which, having been properly filled out, posted and recorded, and the claim marked by stakes or monuments as required by law, shall constitute a perfectly valid and legal location, every requirement of the law having been observed. The Montana Society of Engineers has taken up this matter and advocates the adoption by the several counties of that State of a uniform blank of the character above referred to. It is really a matter for legislative enactment; but as the California Legislature recently adjourned and will not, in all probability, meet again for nearly two years, the subject should receive the attention of the California Miners' Association. The adoption of a suitable location blank by this organization would give it immediate standing, and such a blank would without doubt be adopted by mining districts throughout California. They should be printed upon substantial paper and sold at as low a price as possible, and no certificate of location should be accepted by the local or county recorders other than this official blank properly filled out, or which is not an exact copy of the original notice posted on the mining claim. If the blank is not properly filled out, another should be substituted in its stead by the recorder, whose duty it should be to see that this first step in the location of what may become valuable property be properly and legally taken—all this in the interest of the miner himself, and to obviate the possibility of vexatious and expensive litigation.

Mineral Product of California for 1898.

State Mineralogist A. S. Cooper reports the yield and value of the mineral substances of the State for for 1898 as follows, as per returns at the State Mining Bureau in answer to inquiries:

Mineral Substances.	*Yield.*	*Value.*
Asbestos	10 tons	$ 200
Antimony	40 tons	1,200
Asphalt	25,690 tons	482,175
Bituminous rock	46,836 tons	137,575
Borax	8,800 tons	1,153,000
Cement	50,000 bbls	150,000
Clay, brick	100,102 M	571,362
pottery	28,947 tons	33,747
Coal	143,045 tons	337,475
Copper	21,543,229 lbs	2,475,168
Gold		15,906,478
Granite	98,369 cu. ft	147,732
Gypsum	3,100 tons	23,600
Lead	655,000 lbs	23,907
Lime	297,860 bbls	254,010
Limestone	27,686 tons	24,548
Macadam	452,691 tons	369,082
Magnesite	1,263 tons	19,075
Manganese	440 tons	2,102
Marble	8,050 cu. ft	23,594
Mineral paint	653 tons	9,698
Mineral waters	1,429,809 gals	213,817
Natural gas		74,424
Paving blocks	1,144 M	21,725
Platinum	300 ozs	1,800
Petroleum	2,249,088 bbls	2,376,420
Pyrites	6,000 tons	30,000
Quicksilver	31,092 flasks	1,188,626
Rubble	724,674 tons	445,395
Salt	93,421 tons	170,855
Sandstone	37,264 cu. ft	46,384
Serpentine	750 cu. ft	3,000
Silver		414,055
Slate	400 squares	2,800
Soda	7,000 tons	154,000
Sulphur	2 tons	50
Total		$27,289,079

The relative rank of the counties of the State, in point of mineral production, is given in the following table. In each case the value given includes that of all mineral substances combined produced in the respective counties for the year. Some counties produce in addition to gold and silver, five, six, or seven other substances, other counties which yield little or no gold or silver, produce in quantities quicksilver, mineral oils, copper, lead, asphalt, structural materials, etc. The figures after the names of the counties indicate aggregate value of all mineral products for the year, including the precious metals. The term "undistributed" includes total values of such substances as are grouped to avoid disclosing private business, as in the case of single operations in a county. In the large and complete tables published by the State Mining Bureau, from which these figures are taken, the amount and value of each substance in said county is set forth. It is therefore necessary in some cases to place the figures in the "undistributed" column.

Rank and County.	*Value.*
1..Shasta	$ 3,510,728
2..Nevada	2,072,604
3..Amador	1,849,846
4..Tuolumne	1,757,735
5..Los Angeles	1,732,357
6..San Bernardino	1,644,152
7..Placer	1,535,525
8..Kern	1,129,573
9..Calaveras	1,024,507
10..Trinity	1,010,769
11..Siskiyou	769,125
12..San Diego	694,418
13..Ventura	654,063
14..Napa	555,966
15..Butte	529,225
16..Mono	519,421
17..El Dorado	512,300
18..Santa Barbara	472,784
19..Alameda	443,759
20..Inyo	434,766
21..Sierra	399,582
22..Plumas	369,609
23..Humboldt	357,288
24..Mariposa	337,411
25..Santa Clara	334,848
26..Santa Cruz	270,636
27..Riverside	247,022
28..San Benito	212,585
29..Fresno	201,057
30..Yuba	166,865
31..Madera	147,907
32..Contra Costa	141,440
33..Sonoma	132,709
34..Sacramento	131,438
35..San Francisco	129,595
36..Lake	102,096
37..San Joaquin	91,289
38..San Luis Obispo	84,267
39..San Mateo	77,000
40..Marin	67,800
41..Orange	65,600
42..Lassen	37,760
43..Stanislaus	22,298
44..Solano	20,635
45..Monterey	19,115
46..Tulare	15,900
47..Tehama	9,400
48..Del Norte	9,057
49..Kings	8,450
50..Mendocino	3,330
51..Colusa	1,093
52..Yolo	384
Undistributed	219,990
Total	$27,289,079

All the asbestos produced in California in 1898 was from Riverside county, and the antimony all came from Kern. Asphalt was produced in Kern, Santa Barbara and Ventura counties. Bituminous rock came from Mendocino, San Benito, San Luis Obispo and Santa Cruz counties.

The borax yield was from San Bernardino and Inyo. Brick clay was utilized in Alameda, Butte, Contra Costa, Fresno, Humbolt, Kern, Kings, Los Angeles, Madera, Marin, Mendocino, Monterey, Orange, Riverside, Sacramento, San Bernardino, San Diego, San Joaquin, San Louis Obispo, San Mateo, Santa Barbara, Santa Clara, Sonoma, Tehama, Tulare, Tuolumne, Shasta and Ventura counties. Pottery clay came from Amador, Los Angeles, Placer, Riverside and Santa Clara. All the hydraulic cement came from San Bernardino county. Coal was produced in Alameda, Amador, Contra Costa, Orange, Riverside and San Benito counties. The copper was mined in Amador, Calaveras, Inyo, Nevada and Shasta counties. The pyrites were from Nevada county. Granite was quarried in the counties of Madera, Nevada, Placer, Riverside, Sacramento, San Bernardino, San Diego, Solano, Sonoma and Tulare. Gypsum came from Fresno, Los Angeles and San Benito, and lead from Inyo and Mono counties. Lime and limestone were quarried in El Dorado, Kern, Mono, Riverside, San Bernardino, Santa Cruz, Solano and Shasta counties.

The principal macadam quarries are in Alameda, Los Angeles, Marin, Sacramento, San Benito, San Francisco, Santa Clara, Solano and Sonoma counties. The magnesite was all from Napa county, and manganese all from Alameda. Marble was quarried in Amador, Inyo and San Bernardino counties. Mineral paint was mined in Butte, Nevada and Stanislaus counties.

The mineral springs which utilized the waters commercially are in Butte, Colusa, Contra Costa, Fresno, Lake, Monterey, Napa, San Benito, San Diego, San Luis Obispo, Santa Barbara, Santa Clara, Shasta, Siskiyou, Sonoma and Tehama counties. Natural gas was utilized in Sacramento, San Joaquin and Santa Barbara counties. Paving blocks or basalt were quarried in San Bernardino, Solano and Sonoma counties. The platinum came mainly from Trinity and Siskiyou counties. Petroleum was produced in Fresno, Kern, Los Angeles, Orange, Santa Barbara, Santa Clara and Ventura counties. Quicksilver came from Lake, Napa, San Benito, San Luis Obispo, Santa Clara, Sonoma and Trinity counties. Rubble was quarried in the counties of Alameda, Humboldt, Madera, Marin, Monterey, Sacramento, San Diego, San Luis Obispo and San Mateo. The salt came from Alameda, Colusa, Riverside and San Diego counties. Sandstone was from Alameda, Los Angeles and Yolo counties. The serpentine was from Los Angeles, slate from El Dorado, soda from Inyo and sulphur from Los Angeles counties.

As far as the "banner" counties are concerned, in the different mineral products, the following is the record for '98, with the value of the material from the county named. Alameda county leads in the production of salt ($155,812), manganese ($2102) and coal ($176,250); Butte leads in mineral paints ($3000); El Dorado in slate ($2800); Humboldt in rubble ($297,276); Inyo in soda ($154,000), lead ($21,170) and marble ($12,000); Kern in antimony ($1200); Los Angeles in petroleum ($1,462,871), brick clays ($188,386), gypsum ($18,500), serpentine ($3000) and sulphur ($50); Madera leads in granite ($49,673); Napa in mineral waters ($63.000), quicksilver ($472,972) and magnesite ($19,975); Nevada county leads in gold ($2,017,628) and pyrites ($30,000); Placer county has the most pottery clay ($12,000); Riverside leads in asbestos ($200); San Bernardino has the most borax ($1,120,000), cement ($150,000) and limestone ($6.600); San Francisco quarries the most macadam ($129,595); San Joaquin utilizes the most natural gas ($57,289); Santa Barbara the most extensive asphaltum output ($351,400); Santa Cruz produces the most lime ($151,000) and bituminous rock ($113,898). The bulk of the copper comes from Shasta county ($2,465,830) and this county also leads in silver product ($171,768).

The most paving blocks are from Sonoma county ($13,310). It is to be noted that only one county has the lead on five things—Los Angeles. Four lead on three substances—Alameda, Inyo, Napa and San Bernardino—and the counties of Nevada, Shasta and Santa Cruz lead in two products. The three counties named only have the lead in one substance each.

In the year 1897 the total value of the mineral products of the State was $25,142,441 and in 1898 the total value was $27,289,079, so that the increase for the year is $2,146,638. The figures given show that in the past year the total value of metallic substances, including precious metals, was $20,023,034; of non-metallic substances, $2,102,072; of hydrocarbons and gases, $3,070,596; of structural materials, $2,093,379; total, $27,289,079.

Concentrates.

A "CUBIC FATHOM" of copper ore will weigh about 14¼ tons.

THE chloride of gold is not known to exist in nature as an ore.

IN crushing hard Cripple Creek ores, three ounces of steel are worn away per ton.

KALGOORLIE, Western Australia, is credited with a total production of about $16,000,000 in gold.

IDAHO State assessors have been officially notified that all mining claims therein are exempt from taxation.

THE duty per stamp at the New Primrose mine, Johannesburg, S. A. R., is five tons daily, on conglomerate.

NATIVE GOLD is found in calcite in the Alvord mine and at the Carbonate mine in San Bernardino county, Cal.

THE output of tin from the mines of the island of Pulo Brani, in the bay of Singapore, is reported at 1200 tons monthly.

ELATERITE is used in the manufacture of a substitute for rubber, paint and varnish. It is mined in Utah near Price.

CINNABAR with hematite is found in a vein in rhyolite, near Copper basin, thirteen miles from Prescott, Arizona.

URANIUM MICA occurs in the Ross-Hannibal mines in Ruby basin, Black Hills, South Dakota, and uranium oxide in claims near Terry's peak.

ABOUT 100 hydraulic miners have been engaged to leave Placer Co., Cal., for the works of the Twin Springs Placer Co. near Boise, Idaho.

THERE is no local demand for or production of nickel. Latest quotations are $1 per pound for black oxide; 50 cents per pound for green No. 2.

THE production of copper the first quarter of '99 is reported at 60,441 tons; exports during same period were 38,295 tons, or about 47% of the production.

THE Transmississippi Congress meets at Wichita, Kansas, May 31st, June 1st, 2nd, 3rd, '99. Governors of Pacific coast States and Territories are now appointing delegates.

A PROMINENT mining engineer reporting on a well-known copper property states that there are $11,000,000 in sight in the mine, but in his opinion it would cost $13,000,000 to get it out.

THE Calumet & Hecla Copper Co. of Michigan, has paid $60,850,000 dividends. Its capital stock is $2,500,000. The Tamarack mine is capitalized for $1,500,000 and has paid $5,-770,000 in dividends.

THE presence of tellurium in an ore may usually be detected by pulverizing the mineral and treating it with sulphuric acid in a porcelain dish. A purple color is noticed if tellurium be present.

ANOTHER copper strike is reported sixty miles east of Tacoma, Wash., the ore being said to resemble in character that of Montana. The usually exaggerated statements of values accompany the report.

THE property of the Boston Quicksilver M. Co. comprises 6000 acres in Napa Co., Cal., and is to be opened in an enlarged way, with new machinery. W. B. Buckminster of Boston, Mass., is Gen. Mgr.

THE highest mountain in Colorado is believed to be Uncompahgre, in the southwestern part of the State—14,665 feet. Ouray mountain is 14,447 feet; Mt. Whitney in California is 15,150 feet above sea level.

THE Atlantic mine in the Lake Superior copper region has the smallest percentage of metal in its ore of any of the working mines, yet has paid its stockholders $820,000 on rock yielding ¾ of 1% copper per ton.

THE paving blocks used in San Francisco, Cal., commonly referred to as basalt blocks, are chiefly hornblende and augite andesite; none are of basalt. Granite is also used to a limited extent for the same purpose.

OWING to the curvature of the earth and refraction, an allowance of .572 feet must be made for each mile. A standing at the sea level, only the extreme top of a mountain 4717 feet high would be visible at a distance of 100 miles.

FIFTY carbon steel means that one-half of one per cent is carbon and 99½% is iron, excluding from the computation some small quantities of other elements; twenty-five carbon means that only one-quarter of one per cent is carbon.

SHEET LEAD may be joined for the purpose of lining tanks for holding acids by using common solder. The joints may be lapped if desired. The Chinese have a method of their own not generally known or practised in this country.

GLAUCOPHANE SCHIST is not uncommon in California. It occurs abundantly in Marin county, also near Sulphur Bank in Lake county. Glaucophane is very similar to hornblende, to which mineral species it belongs, and is usually of a blue color.

A NEW ZEALAND dredging company states its expense to be $268 for six days, as follows: Fuel $48, labor $120, superintendence $100. The dredge handles ninety tons per hour and pays a dividend on gravel containing 1¼ grains of gold per cubic yard.

AMONG other veracious statements, an English mining publication remarks that an Australian miner, in working an old abandoned gravel mine, has found a nugget of gold weighing 216 ounces, in a pillar 3 feet square that had been left standing to support the roof.

CYANITE or disthene is found in Los Angeles county, near Acton, and in abundance in the Cargo Muchacho mountains, near the American Girl mine, where it occurs in a broad zone of schist. It has a pale blue color and occurs in bladed crystals. Cyanite is an aluminous silicate.

THE only people handling antimony on this coast are the Chapman Smelting Works, San Francisco. There is another concern on Staten Island, New York, and a third in New Jersey. Antimony reduction works would not pay unless one had a very large deposit. Miller & Ferris, Havilah; Sumner & Brown, Kernville, Cal., W. A. Van Reed, Bernice; J. Sutherland, Lovelocks; Pea Vine M. Co., Pea Vine, Nev., are reported owning antimony mines. A Blanc of Oakland, Cal., was last week reported to have bought an antimony mine near Mojave, Kern county, Cal., for $12,000.

MOUNT GLEASON in Los Angeles Co., Cal., consists largely of a feldspathic rock very much like the anorthite rock of the Lake Superior region. The rock is crystallized and of bluish-gray color, contains little or no quartz and no mica or hornblende. In this formation gold-bearing veins occur.

A U. P. HANDBOOK states that Utah mines have yielded an aggregate of $197,389,205.53, that the dividends paid exceed $2,000,000 annually and that "Utah mines have paid 100% more dividends than Colorado mines have and $5,-474,231 more dividends than the mines of Montana have."

WHERE a shaft is sunk through a large ore body a pillar of sufficient size must be left to insure the security of the shaft. If stopes are carried too close, the ground in which the shaft is sunk is likely to shift, throwing the shaft out of line and resulting in great and unnecessary expense, and danger as well.

THE Cripple Creek, Colo., Engineers' Union has adopted the following schedule of wages and hours, to take effect May 8th: Hoisting and stationary engineers, not less than $4 per day of eight hours; pumpmen, not less than $4 per day of eight hours; firemen, not less than $3.50 per day of eight hours.

IN the absence of any law to the contrary, some California miners are going back to the old miners' district plan, in vogue for so many years. For instance, to-day is held at Sonora, Cal., a meeting of quartz miners to "adopt the old quartz mining laws made by a similar convention in Sonora Oct. 5th, '72."

THE stoping of a vein up to the surface, leaving a line of open excavations along the lode in the early history of the mine, is bad practice, but one nearly always followed. It leaves the lower workings exposed to surface drainage, and caves usually result, increasing the size of the open cuts, which still further increases the disadvantages of the system.

THE new metal "copper steel" is attracting some attention, as it possesses high resistance and can be forged like iron. In the process of its manufacture zinc or a zinc alloy is employed for retaining a certain proportion of iron, nickel, or chromium in the form of oxide, and reducing and incorporating it in a state of fine division in the presence of furnace gases.

"RECALESCENCE" is "a phenomenon peculiar to heated iron or steel of glowing more brightly when certain temperatures are reached in the process of gradual cooling from a state of high incandescence." This is supposed to be due to a change of molecular structure. At such temperatures the magnetic and other properties of the iron also suddenly change.

PUMICE STONE is produced cheaply and in large quantities in Utah and thence shipped to the Chicago Pumice Co. It is plentiful in Sonoma county and other parts of California. The specimen sent is of good quality, but the substance is imported as ballast to the Atlantic coast consumer from Europe so cheaply as to ordinarily make its mining on this coast unprofitable.

WHERE two persons locate two adjoining claims on the same vein and agree to sink a shaft jointly on the vein at the joining end lines, $200 worth of work must be done regardless of the size of the shaft, and each locator should post a notice stating the fact that the assessment work was done jointly, and also the cost of the work, which must be determined by the local rate of miners' wages.

DEFINITE and repeated experiments and practice show that at from 205° C. to 360° C. there is a regular run of colors in a steel bar heating. Above the latter temperature are three different points where the rise of temperature is checked—that is, the metal momentarily contracts and then re-expands. The "recalescence" does not take place during the heating of the bar, but during its cooling.

THE article on gold in granite in California in last Saturday's issue was, as indicated, a recital of facts on such gold occurrence in that State. That gold is a constituent of granite in other localities is an equally well known fact. Gold is so found in several places in Sonora, Mexico, in central and northern Arizona; in the Homestake mine, South Dakota; at Butte and Walkerville, Montana, and elsewhere.

CINNABAR occurs very commonly in the Coast Range of California, usually at or near the contact of sandstone and serpentine. Many of these occurrences are of small importance, yet are geographically similar to those of many of the large producing mines. Cinnabar is also found in small quantity in the gold belt, one notable occurrence being in Mariposa county near Horseshoe bend of the Merced river, where the cinnabar is associated with gold.

IN the issues of the 15th and 22nd inst. appeared formulæ for the making of powder by which to take flash-light pictures underground. Attention is directed to the necessity for great care in the use of such powder when it contains potassium chlorate or perchlorate, as it is peculiarly sensitive to friction and liable to explode. It is also susceptible of decomposition, in which state it is explosive, and in general it is a substance that had best be let alone.

THE ohmic resistance in a motor is nearly the same whether running or at rest. Counter electro-motive force is developed when running, which operates exactly like an ohmic resistance, and which rapidly increases with the speed. This prevents a motor from running too fast, and enables it to absorb more energy when going slow. The armature of a motor is more liable to burn out when going slow than when going at high speed.

THE meeting of the American Institute of Mining Engineers in San Francisco next October will be the most important mining event of the year to California. The interchange of ideas, personal observation, acquisition of accurate knowledge, and the practical, business-like methods of the members must result in mutual benefit to visitors and visited alike. The Institute has met three times in Colorado, '82, '89 and '96. The October, '99, meeting will be the first in California.

IN the Independence mine, near Victor, Colo., said to have been sold last week by W. S. Stratton to English investors for $10,000,000, the ore impregnates a phonolite or nepheline basalt dyke coming up through coarse red porphyritic granite which at contact with the dyke has been much affected by the hot steam and ore solutions ascending along the volcanic dyke, resulting in a honeycombing of the granite, a leaching out of its constituent mica, and replacing it with gold-bearing ores, such as sylvanite, pyrite, and free gold.

OREGON'S new mining law makes it mandatory on all persons, companies or corporations employing miners to file with the county recorder and post in the mine office, the name or names of the owners, whether the work is being done as owner, lessee or agent, where the principal office is located, the name of the responsible representative, the day of the week or month when payments for wages or supplies are made, a statement of all mortgages or liens against the property and when due. The law is a good one, locally, but will not be generally enforced.

ZINC LEAD sulphide ores are not extraordinarily difficult of treatment in Colorado or elsewhere. A Leadville ore of that class goes 27% zinc, 18% lead, 21 ozs. silver and 5% of 1 oz. of gold to the ton. The Broken Hill, Australia, ores of that character average 20 ozs. to 25 ozs. silver, 15% to 25% lead, 25% to 35% zinc. There is an ore mined at Temaxcaltepec that carries from 30% to 40% zinc, 5% to 10% lead and from 15 to 60 oz. silver per ton. F. L. Bartlett, Canyon City, Colo., would be a good man for our three inquirers to write to. He buys zinc-lead ores.

CARBONIC ACID is a distinctly poisonous gas. It does not act by merely diluting the oxygen of the air. Three per cent of carbonic acid in air is noticeable; 10% occasions respiratory distress. A higher percentage acts as an anæsthetic. A candle will not burn in an ordinary atmosphere containing 15% carbonic acid, though if the percentage of oxygen in the air be considerably increased a candle will remain lighted in an atmosphere containing 50% carbon dioxide, this further illustrating what has hitherto been stated, viz., that the burning or extinguishing of a candle flame is not an infallible test as to danger to human lungs.

HUNGARIAN and longitudinal riffles are synonymous. For sluices 12 to 14 inches wide they are made of narrow slats, being secured by pieces nailed at right angles at each end. In long lengths it is customary to give rigidity and strength by placing a small block 2 inches in length between each slat midway between the ends. If the riffle is not over 6 feet in length these center blocks will not be necessary. The riffles thus made are laid in the bottom of the sluice box and secured by wedges driven in at the sides. They may be pulled out at any time with a pick point. In flumes 3 to 4 feet wide similar riffles are sometimes used made of 2 or 3-inch scantling 4 inches deep.

IN reply to the Los Angeles, Cal., concern that wants to buy from some one in California 1000 tons of graphite equal to Ceylon quality, it is believed that the order can not be filled. Practically, graphite does not exist in California in commercial quantities. There were several San Francisco dealers, but none have produced any of consequence for a long time. The California Graphite Co. have a deposit near Cazadero, Sonoma Co., but it has not produced any. The Elkhardt mine is near Watson's, Mendocino Co., twenty-eight miles from Ukiah, but is a non-producer, being of too low grade to be used. There are several small known deposits in southern California, none of which have been utilized.

THOUGH the whole matter was fully and clearly stated and explained on the editorial page of the issue of the 8th inst., and universally copied all over the State, numerous questions are still being received asking what the present status of the California mining law is. There seems to be an impression among some miners that some important new laws were enacted by the recent Legislature. All that was done regarding mining at the last session of the California Legislature was the repeal of a law passed by its predecessor regarding location of mining claims; so that "the mining laws of California" are just where they were and what they were before that law was passed in '97, that particular law passed in March, '97, having been repealed in March, '99.

TO BRAZE a band saw scarf the saw ends to match with a ¾-inch lap for small saws, up to ¾-inch for large size. If the scarf is brought to too sharp an edge it is liable to burn. Bind together with fine iron binding wire, with the laps wet with a paste of borax and water ground on a piece of slate or rough glass. Pin the blade, laid straight, on a large piece of charcoal, ground flat, with a recess excavated under the scarf so as to allow a blowpipe flame to pass under the saw blade. Put a piece of brass, or better still, silver solder or coin, on the upper edge of the lap, with sufficient ground borax to flow the brazing easily. Heat with a blowpipe under and above the blade until the solder flows, when it will draw entirely through the lap. When cold, file to an even thickness.

THE amount of water evaporated in a boiler can be determined as follows: Take the mean between the widths of the two levels at the beginning and at the end of a space of fifteen minutes as indicated by the glass gauge. Multiply the constant length of water surface with this mean width, and the product by 4, giving the amount evaporated in cubic inches; dividing by 1728 gives result in cubic feet. One-half cubic foot, 3¾ gallons, evaporated in one hour, equals 1 H. P. To find the H. P. of a tubular boiler by the heating surface, ascertain the number of square inches of hea ing surface around boiler shell from fire line to fire line, and in the flues; divide by 144 to get square feet; divide quotient by 15 if horizontal tubular, or by 12 if locomotive or vertical boiler, to get H. P.

MECHANICAL stokers, contrivances to feed coal automatically by machinery to a steam boiler, rightly handled, work well and are economical. They may be divided into four general classes. In one the coal is carried on either horizontal or inclined grate bars which are given a rocking or reciprocal motion which gradually advances the fuel along the grates; in another kind the grate has a steep incline, and the coal being pushed onto its upper end slides slowly down as it is consumed; in a third the entire grate forms an endless chain of short bars, on which the coal travels horizontally into the furnace; the chain passes over a sprocket wheel at the end and returns through the ash pit. In still another class of these devices fresh coal is fed in underneath the burning coal and the gases distilled from it pass through the bed of hot coke above. In this kind the action is just the reverse of that in the down-draft furnace where the fresh coal is fed on top of the bed, the gases passing down through the bed of hot coke beneath.

Mexican Methods of Mine Management and Operation.

Written for the MINING AND SCIENTIFIC PRESS by GEO. F. BINCKLEY.

In the conduct of a mining business in Mexico there are two master-words—simplicity and co-operation. In these two words are crystallized the experience of three centuries of mining under disadvantages that are little known in this country, the most striking being inefficient and unreliable labor and the almost total lack of machinery. The necessities of the case have developed the system, and the system makes possible the profitable operation of mines in Mexico that would wreck an American company in a year.

This fact is not due so much to the "cheap labor" that is supposed to be so plentiful in Mexico, as to the manner of extracting work from a class of labor that is notoriously shiftless and reluctant. The payment of labor by the day is rarely practiced by the mining concern itself, for it is almost impossible to get foremen or shift bosses that will make the men really work; but when these shift bosses become petty contractors, as under the Mexican system, and look personally after the men under them, and have to pay them so much a day for their labor, then it is surprising what efficiency the labor may be made to show, for these contractors, having their own interests at stake, are as exacting taskmasters as can be found anywhere. In almost all cases it is found more economical to do all the exploration work by contract, and in many camps the actual work of ore extraction is done under a tribute system that is one of the best illustrations of the Mexican method that can be shown, insuring, as it does, the fullest co-operation between the miner and the owner, and the maximum efficiency of the labor employed, which is secured by the only true means—making it a matter of self-interest. The Mexican mine manager does not purchase labor from the lowest bidder, at so much per day, but arranges it so that the miner always gets his rated proportion of the gross results of his labor. This, as will be seen, does not lay the burden of the possible mismanagement of the business on the shoulders of the miner, but, whether the mine pays dividends or not, if there is rich ore being mined, the miner is making money, and if the management is poor, or if heavy expenditures are being made, it is no concern of his.

Taking up first the exploration contracts, which are always verbal, and may be terminated at the pleasure of the manager, they may be said to represent about the only successful form of communistic labor, although the contract is always let to one man, and he is held responsible for the proper performance of the work. This contractor, however, quite generally works with his men, and his share of the profits on the contract are very slightly in excess of the share of the ordinary "barretero," or working miner, who is paid every week by the contractor in proportion to the number of men in the gang, and the amount of work performed and paid for by the mine. The fact that all the members of the gang are interested in the performance of the greatest possible amount of work tends to make them work with a will; but, if any skulking is done, the offender is promptly "fired" by the contractor and his comrades, who are very strict in this matter.

Now, regarding the cheapness of the labor in the mines of Mexico, it may be stated from the writer's own experience that the average pay or profits of the working members of a contractor's gang in representative mines is about $2 per day, and it must be remembered that these men, although they are required to be within the mine gates at 6 o'clock in the morning, rarely get started before 8:30 or 9, as they generally go down the ladderways, and their preparations for work are very leisurely. When they get to work, they work hard, but quit early in the afternoon and are out of the mine by 4:30 or 5 o'clock. Taking these hours into consideration, it will be seen that the Mexican is not so badly paid after all, and, as a matter of fact, he could, if he were not so shiftless, live very comfortably on what he makes, for in Mexico the miner is the aristocrat among laborers and looks down on those of the field and farm.

In connection with this matter of exploration contracts, it will not be amiss to quote some costs of work. All drilling is done by hand, and in this case the powder and candles are furnished by the mine, as well as tools and sharpening of same.

Drifting in solid limestone, size of drift being two meters square, strata about horizontal, costs from $26 to $35 per meter (39.37 inches), according to the progress made per week, a sliding scale of prices being paid, less than three meters being paid for at the lower rate, three to five at an intermediate rate, and five to eight at the highest figure. The sliding scale insures that the work will be performed in the minimum time, the resulting cost being an average of about $28 per meter for labor alone. Same size drift in hard, tough quartz costs $40 per meter, and in solid porphyry about $22. In decomposed porphyry this size drift costs $16. In none of the above was there any timbering whatever, and whenever there is timbering to be done it is paid for by the mine and done by the contractors, on a separate account, or by timbermen under a boss paid by the mine, or, oftener still, by contract. The work is generally measured up on Sunday morning, and the account settled for the week. This system is universal, and is entirely satisfactory.

The extraction of the ore from the stopes is carried on under an entirely different system—one in which the miner acquires a right to a certain percentage of the ore that he extracts, or that is extracted by the gang of miners of which he is a member. This percentage varies with the grade of the ore, being one-third of the whole amount in the case of ore of the lowest grade, and one-twelfth to one-fifteenth in ore of the highest grade, according to the practice of the mine. This ore belongs to the miner and he may sell it to outside parties, or it may be bought by the mine and paid for at its assay value, minus a fixed treatment charge. This system is employed at the mine of Santa Ana, Catorce, S. L. P., managed by Francisco M. Coghlan, one of the ablest mining engineers and managers in Mexico. At this mine the share of the miner is never less than one-twelfth of the amount that he extracts, even in the case of the richest ores, and is one-third in the case of the lowest grades. Almost all the "rescate" or miners' shares of the ore is bought by the mine, as the reputation of the management for honesty in its dealings with the miners is very high, and the price paid is as good as that paid by the ore buyers. The practical working of the system is excellent, and serves to keep the men at work when the mine is not in good ore, in hopes that a good strike will be made. Just here paternalism plays a rather important part, for if a miner leaves the mine when it is poor and wishes to return when it is again in good ore, the best workings are not open to him, but are reserved for the men that have stayed with the mine through its hard times, and spent their time, when not at work in a stope or on contract work, as "buscones," looking for ore on their own account wherever the prospects seem good and they can obtain the consent of the manager to work. Many of the most valuable ore bodies have been found in this manner and the finder is rewarded with the richest portion of the stope to work, with a limit as to the number of men he can employ in his gang. This work in the stopes is always under the direction of the mine foreman and the engineer and they attend to all the timbering, pumping and handling of the ore. Those men who have been the most faithful and steady are always given the best stopes, but when the ore is very rich, miners from the poor stopes are allowed a certain time in the stope every day—sometimes but one hour—and in this time they work like demons, for their share is worth a good deal even for a short shift, and when they get their ore sacks in the ore yard it is a sight to see them go into the mine and down the tunnel at their best pace, on a "dead run," for the time begins when they get the ore sacks, and they want to make the best of it.

Paternalism plays a very important part in the management of the best Mexican mines, and when the character of the labor that is employed is taken into consideration it will be seen that it is not only natural but necessary for the best interests of all concerned. And again, if only as a matter of policy, fair dealing is the natural result of this system, for the spirit of co-operation is general and extends from the lowest to the highest employe, making the best interests of the mine a personal matter to all. In the case of very low-grade ore the pay of the miner, as represented by his share, is very low—just about enough for him to live on, but when the mine gets into good ore his earnings sometimes run up to a figure that would be very pleasing even in this country, several times in a few months at the mine of Santa Ana the share of a single miner for a week's work having realized sums from $500 to $2200, the former figure not having been unusual—the latter exceptional. However, when the mine is doing even fairly well, the amount that the miner realizes per week is quite generally considerably above that which would be received as pay by a the best business men in these mining towns are exminer in this country, dollar for dollar, and many of miners that have had the forethought to save from the large earnings that they have made from time to time.

It will easily be seen that under this system of working, where every miner has a personal interest in the success of the mine, and every incentive for using his brains as well as his hands, and is allowed to test his theories as to the probability of finding ore bodies in promising spots by his own exertions, unpaid for by the mine, a large force of men may be kept employed, and by their own unaided efforts, or by certain limited assistance when it is in the judgment of the management expedient to do so in order to facilitate the exploration of a piece of ground at a minimum cost, valuable ore bodies may be discovered and the mine put on a paying basis, while if the whole expense of exploration were to be borne by the mine, it would often be impossible for operations to be continued at all, owing to the immense cost of the work. The incentive of personal interest leads the men to work along while their beans last, and when they are at the last notch the mine will often give a small weekly allowance to the men in order to enable them to continue the work. If a discovery is made, then the good times have come again for the mine and the miner alike. It is the fairest system conceivable, for the miner shares the fortunes of the mine—when the mine is prosperous the miner is also, and when the mine is on expense and in a bad way financially the miner shares the hard times, but with hopes for the future and every incentive to help on the enterprise.

Important as the effect of the working of this system is on the working miner, or "barretero," it is far more significant when the "empleado" or permanent employe is considered. In a somewhat different way, he also has the benefit of the miners' prosperity, or shares its hard times. All the permanent or salaried employes receive a share of the mine's output, sometimes in the shape of a certain percentage of the net profits, sometimes a certain percentage of the gross output, and sometimes, in fact, generally, the employes form a kind of subordiate organization, under the direction of the manager of the company, which has the privelege of putting gangs of men to work in the richest stopes a certain number of shifts each week, these gangs working under the direction of a foreman and shift bosses who are interested in the "campos," as this subordinate organization is designated generally. The miners who work for the "campos" are paid by the shift, a fixed sum, and receive no share of the profits that accrue to the employes from the working of this system. In the distribution of the ore according so the assay value, the same rules hold good that are applied to the distribution to the individual miner, and the "miner's share" of all the ore mined on account of the "campos" is sold, and the proceeds of the sales kept account of until the end of the year, when a settlement is made and the money distributed to the employes according to the importance of the positions held by them, the manager of the company, of course, having the largest share, then the engineer, or assistant manager, then in the order of their importance, the foremen, the bookkeepers, the shift bosses, and so on down to the men who weight the ore in the yards, even the office boy coming in for his share. It is easy to see that under such circumstances the employes, from the manager down, have the keenest personal interest in the success of the mine from a business standpoint, and anything that they can do or suggest toward the improvement of the method of working, or that will in any way contribute to the economy of the management, is sure to be done, and dereliction of duty is promptly discouraged by all the employes and is not permitted by the management.

Now, one of the most important features in the application of this system is the fact that none of the employes have any vested interest in the mine, or even in the "campos," but the distribution is made entirely at the discretion of the manager, and neglect of duty, insubordination, or any cause for the discharge of the employe forfeits his right to the share that would have come to him, and he has no recourse in law, as the distribution is entirely gratuitous on the part of the mine.

Now, although the effect on the morale of the employe is invaluable, this distribution to the employe on the salary list costs the mine nothing, yet it often has the effect of making the annual pay of the salaried men in the mine seem insignificant when it is compared with the amount that is distributed through the "campos" system, in one instance that the writer has in mind, the weekly pay of the assistant manager being but $20 per week, his share of the "campos" was nearly $15,000 for the year! The share of the manager was a great deal more than this, and for that year every employe received a dividend that was far greater than his whole year's salary. The salaries paid under this system are, with the exception of that of the manager, always nominal in amount, so that if the mine is too poor to pay the "camperos" to work in to advantage, they receive only about enough to keep them going, with nothing to spare, and, in fact, the salary of the manager is frequently very small when compared to those paid in this country.

While the system that has been explained in the preceding part of this paper could not be applied in its entirety to the conditions that exist in this country, there is no reason that the principle could not be used with the greatest advantage as far as the higher employes of American mines are concerned, and instead of high salaries being paid to the manager, his assistants, and the other permanent employes, whether the mine is prosperous or not, the salary could, as in the Mexican system, be nominal, and the mine could well afford to distribute among them a certain percentage of the net profits of the mine for each month or year. This distribution would, however, have to be made in the the most perfect good faith, for on this rests the success of the system, and any evasions would be disastrous to all good feeling. Net profits would have to be taken to mean in this case the value of the gross output of the mine, minus the expense of operation, and this expense account could not be made to cover construction, purchase of new properties, or additions to a sinking fund, for the employes, not being stock holders, could not be expected to help carry the

burden of permanent improvement or the sinking fund, as their interest would cease when they left the employ of the company. In this connection the writer ventures the opinion that the very worst thing that could be done would be to make the employes stockholders, even to a very limited extent, for in order that the incentive should be greatest, the employe should have no vested interest whatever, but his share of the profits of the mine should rest solely on his own efforts and a failure to work earnestly in the interests of the mine should entail the loss of all his privileges and interests with the loss of his position. In this way alone could the highest efficiency be maintained.

In the business management of the mine co-operation, as has been shown, plays by far the most important part, and in the mechanical methods employed simplicity is an equally prominent feature. The Mexican has been forced to this by circumstances, but in the long years that he has had to deal with the problem of ore treatment without machinery he has learned many facts of great importance from a business standpoint as regards the commercial efficiency of his crude mechanism. In this country the efforts of our engineers have been directed towards the perfection, mechanically, of the machinery used in the mining and reduction of ores. It is beyond doubt that this perfection is of a high degree and unsurpassed in the world, and it is equally beyond question that the treatment of ores in great quantities under the present complete and complicated system of mechanical methods is not only the most efficient in a mechanical sense, but also in a commercial sense; but when the small mine, working under difficulties and with no great amount of ore in sight is considered, the Mexican system becomes instructive. Many mines would be at least on a modestly paying basis to-day if, when the operations were started, the manager had been engaged under an agreement which would give him the full control of the property, and, in addition to a small salary, a certain percentage of the net profits of the mine. Under these circumstances a man of high ability and great experience would be within the reach of a modest corporation, for men of this type are by no means averse to taking chances where they have reason to believe that the property is a good one; but they would not take a small salary with no prospect of sharing in the benefits that might result from their own good management. Now, in addition to this arrangement being almost universal as regards the employment of a manager, the Mexican spends only the amount on surface improvement that is absolutely necessary, and the bulk of his available capital he puts underground, knowing well that if he has ore it is not a serious matter to get the metal out of it. The different mental aptitude of the Mexican as compared to the American miner is well illustrated by the different characters of the mining failures in that country and this. In Mexico when a mine has failed there are frequently very extensive underground workings, representing a large amount of expenditure, but on the surface there is hardly anything to show that mining operations have ever been carried on, for probably all the machinery that was employed at the mine proper was a horse, whim and a steelyard, and all the machinery for the reduction of the ore consists, in the case of a gold mine, of a few arrastras, and perhaps a crude Chilian mill—a disc of stone, with a hole for an axle, and a few stones set in a circle for dies. If the mining has been done for silver, then there will have been a "patio" for the amalgamation of the pulverized ores, and a few crude agitators for the washing of the gangue from the amalgam. All the power will have been supplied by mules and horses, and the only labor employed the cheapest and most unskilled, for but one or two skilled men are needed in the working of these processes. The consequence of all this is that when the operations have at length been discontinued, because unprofitable, the owners have the satisfaction of knowing that what money had been spent was spent in development and not on superfluous surface improvements. The average history of mining failures in this country is a promising prospect, a promoter, formation of a corporation, a mill big enough for ten times the amount of ore reasonably to be expected, expensive hoisting works, pumps, etc. Then when all this is installed mining operations are begun, the mill started, and the fact soon discovered that there is not enough ore in the mine to run the mill on quarter time, at quarter capacity. Then the stockholders are asked by the high-priced manager to put up more money for the development of the mine, but the gentlemen, having expected by now to be drawing dividends, refuse his modest request, and the property is practically abandoned. It is beyond question that many a good mine has been abandoned because the stockholders have spent all their money on surface improvements, trusting to luck that they will find ore, while if they had developed the property before putting up surface works a fine property might have been developed.

If the capitalist would only develop his mine, and the prospector would only be a little less ambitious as regards his machinery equipment and the amount of ore he is going to handle, many mines would be put on a paying basis that are nothing but prospect holes now; and if the small mine owner would only avail himself of the simplest, crudest, and at the same time the most efficient gold saver ever devised —the arrastra—he could oftentimes make the little mine pay its way and a good deal more. But this would be slow, and the average mine owner, prospector or capitalist insists on quick returns, and in this respect differs most strikingly from the Mexican mine owner, who runs a mine as he does a grocery store—on strictly business principles. The Mexican, when he wants to explore a certain piece of ground, runs a level or crosscut as small as possible, and turns it from side to side as the indications may point; or, if he is sinking, he will turn and twist along what seems to be a vein or stringer, and will make a hole just about big enough to crawl into, but he gets to the same place that a roomy, square-timbered drift, crosscut or winze would have taken him, has explored the ground, taken out what ore he has come across, and all at a very low cost. When he does get into the ore body, then he arranges for getting it out, but not until then.

A more thorough development of the mine proper, in all cases before large expenditures for machinery are made, would tend to put the mining business in this country on a footing that it has never enjoyed so far, and the remarks made regarding the amount of machinery placed on mining property are intended to apply only to those properties that have not been developed to the extent that will justify, in a commercial sense, the expenditure of money on surface works. This would result not in cutting down the amount of machinery used in mining operations, but the contrary would be the case, for a developed mine requires a machinery equipment, and the thorough development of the mine beforehand would only make the need a business matter instead of a gambling scheme.

The peculiarities of the Mexican system render the working and development of a very poor mine a possibility by keeping down the expenses in times of financial difficulty through the co-operation of the employes, the almost total absence of skilled labor, and the contract and tribute systems of working underground. This could not be applied with any benefit in the large mines of this country, but in small properties, prospects and new ventures it would seem that the system might be applied with great advantage, for personal interest, after all, is the most powerful incentive to persistent and effective work.

As to the discovery of acetylene gas, *Electricity* relates that some years ago Thos. L. Wilson of St. Catherines, Ont., was smelting for metallurgical purposes. From time to time he used a great deal of rock salt in his furnace stock, and also limestone as a flux. Whenever these two materials were fused together, the slag produced by the intense electrical heat included a dirty grayish substance wholly unlike anything else he had ever seen. For weeks he noticed this substance without giving more than passing attention to it, dumping it into the stream upon the bank of which he had built his furnace. One day a curious thing occurred and at a time when the pile of slag had become so large that its top rose above the surface of the water. A minute or two after dropping the slag as usual into the stream, some of it going under and a part of it remaining above the water in a red hot state, the sizzling and steaming was followed by a bright burst of flame. The next time Mr. Wilson used rock salt and limestone the blaze again appeared over the slag after it had been cast into the river, and, it being at night, he was much struck with the brilliant white light produced. The next time he had a batch of the queer grayish residue to dispose of he did not waste it, but saved it and poured over it some water for experiment. To his surprise, there was no flame, but, after puzzling awhile over this feature, he held a lighted match over the pile, when instantly there was a white, glowing flame.

A GREAT DRAWBACK to the identification of original corners of old mining claims in California is found in a lack of official permanent monuments. When the surveyor turns to the section corners and subdivisions of sections he finds he cannot make his survey close within many feet, if the initial point be taken from opposite sides of the section each time. Nearly all the original corners have been moved, by whom it would often be impossible to state. The most common object chosen in fixing the corner of a mining claim is a tree. Certificates of claims located thirty to forty years ago describe certain bearing trees, giving the name of the kind of tree and its diameter. In many cases the tree has disappeared entirely and in others it has grown to such an extent as to be no longer recognizable. A tree is not a suitable monument to identify a mine survey or other corner. But there is an absolute lack of permanent monuments such as are established by the government elsewhere.

The Pneumatic Cyanide Process.

The pneumatic cyanide process is based upon the necessity of oxygen in connection with cyaniding, and the fact that its chemical activity depends largely on the amount of oxygen mixed or combined with the solution. Many plans have been devised to admit the oxygen of the air to the solution and ore during the leaching process. In some mills the tanks are placed one above the other and the ore transferred during leaching in order that it might absorb oxygen in its passage through the air; others have used mechanical stirrers, etc. The pneumatic process introduces a constant supply of the oxygen of the air into the solution and saturated mass from beneath, and utilizes the power of compressed air.

The method of using it is as follows: The leaching vats are filled with the crushed ore and flooded with the cyanide solution in the usual manner; the valve regulating the amount of pressure is then opened, the current of compressed air—one-fifth pure oxygen —is turned into the space beneath the false bottom, evenly distributed by a coil of perforated pipes over the entire space between the false and true bottoms of the leaching tank, from whence it forces its way through the perforated false bottom and rises through the mass of saturated ore. The inventor says: "If the ores are of a talcose or clayey nature and show a tendency to disintegrate and settle as mud or slimes on the false bottom, the compressed air may be turned on so strongly that the whole mass can be kept seething and boiling until settling is impossible."

Fig. 1 shows a series of leaching vats or tanks

FIG. 1.

fitted with pipes and valves for the introduction and control of the compressed air.

Fig. 2 is a cross section cut down through the

FIG. 2.

middle of Fig. 1 and shows the air pipes between the true and the perforated false bottoms of the vats and the trap door in the bottom for discharging the leached refuse.

Fig. 3 is a view of the bottom of a leaching vat, with a portion of the perforated false bottom cut away to show the coil of perforated air pipe, by which the compressed air is evenly distributed over the entire bottom of the vat.

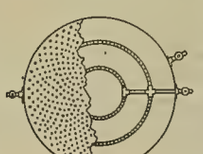

FIG. 3.

There is also, in connection with the patents of the Pneumatic Cyanide Process Co., a special form of vat for treating slimes or talcose ores, which is built with a solid air-tight cover containing trap-doors through which the vat is filled, and a trap-door in the bottom through which it is unloaded. During the leaching and agitation treatment, the trap-doors in the solid top are left open, but when the values are all extracted by the solution the trap-doors are fastened down on air-tight gaskets and the air pressure is turned through an upper pipe into the space between the solid top and the leached ore and solution, to act as a filter press and drive the solution downwards and out of the vat through the drain cocks.

To wash the leached ores and thus recover the last trace of values, the trap-doors in the solid top are again opened, the mass flooded with pure water or a weak solution, the compressed air reversed to the bottom pipes and turned on in such strength that the mass is violently agitated, with the intent that the remaining values shall be absorbed and blended in the wash water; then the trap doors are again closed down, the air pressure reversed to the top, the watered solution driven down and out through a separate drain pipe and led to a reservoir where it is strengthened for use on a new charge of ore; the refuse is thrown out of the vat through the bottom trap-door, and it is then ready for refilling.

If the air is passed through a small furnace between the compressor and the leaching tanks and heated, it will heat the solution, giving it greater power of extraction and enabling it to do more rapid work.

The expense of equipping or arranging cyanide plants already built, so that the pneumatic process may be used is stated to be small, as all that need be added to the present tanks are the pipe connections with ordinary globe valves. If there is a compressor in use at the mine for driving air drills, a connecting

pipe can be laid to the mill any distance required and the air brought in for leaching purposes. For most ores it is not necessary to use a large amount of air, all required being to keep the solution thoroughly filled with oxygen. In building new cyanide plants, it is claimed that a smaller number of vats will be required for a given capacity, and that this saving will more than cover the cost of fitting up to use the pneumatic process.

The Pneumatic Process Co. proposes to sell outright to any mill or mine owner the full right to use this process for the lifetime of the patent—that is, to sell mill rights with full authority to enlarge the present capacity of the mill to any extent desired without further payment. A pamphlet containing full details is issued by the Pneumatic Cyanide Process Co., 306 Boston Building, Denver, Colo.

Latest Mining and Metallurgical Patents.

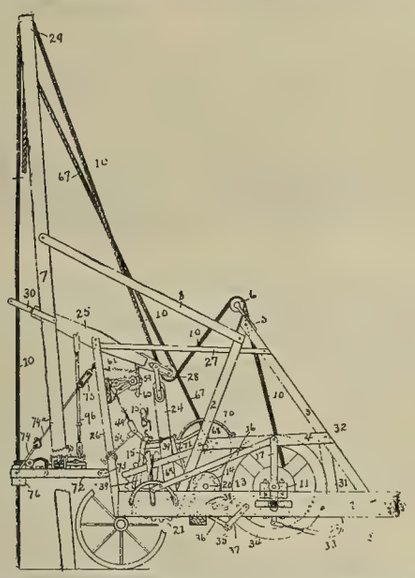
Patents Issued April 18, 1899.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

EXTRACTION OF ZINC AND COPPER FROM ORES.—No. 623,154; H. Howard, Brookline, Mass.

A process of extracting zinc and copper from ore or residue, consisting in dissolving zinc and copper and their soluble salts from the ore or residue by treatment with a solvent, including aqua-ammonia and an ammoniacal salt in solution; separating the copper from the solution; driving off the ammonia from the remaining liquor in the presence of a base stronger than ammonia or zinc oxide, the base combining with practically all of the acid radicals present to form one or more salts, and finally eliminating such salt or salts in the residue.

WELL DRILLING MACHINE.—No. 623,182; A. Rodefeld, Richmond, Ind.



A well-drilling machine, a combination with a rope-turning clamp, of a screw shaft, a train of gearing between rope-turning clamp and screw shaft, ratchet wheels mounted on screw shaft in reversed positions, a nut movable back and forth on screw shaft, a lever having a close connection with nut, a second lever engaged by first-named lever, the second lever having a spring connected to its pivotless end to facilitate its movements over the center, a third lever pivoted above second lever, a transverse lever engaging with third lever and locking it in its position, a rotary and longitudinally-movable shaft to which third lever has a swivel connection, and prawls on shaft engaging alternately with ratchet wheels and imparting reversed movement to the screw shaft and gearing.

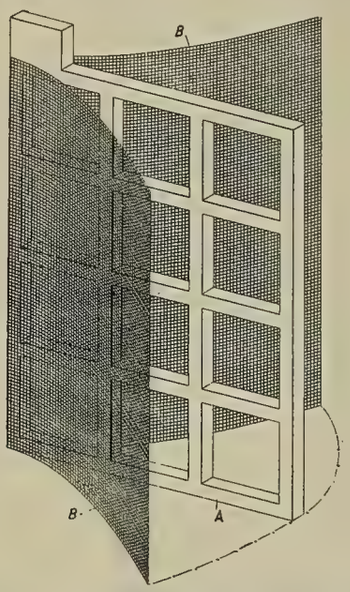
METALLIC ALLOY.—No. 623,209; J. P. Fullerton, London, Eng.

A homogeneous metallic alloy consisting of ninety-one parts of lead, one part of copper, one part of bismuth and seven parts of antimony to every one hundred parts of the alloy, produced by the process, which is for producing a homogenous alloy of lead, copper, bismuth and antimony, and consists in taking a small portion of the lead, heating it to the melting point of copper, then introducing into this molten lead the copper in a finely divided state or dust, stirring the while, then adding this mixture of copper and lead to the antimony which latter has been melted in a separate pot, then adding the remainder of the lead and finally the bismuth; the whole being stirred until thoroughly amalgamated.

COMPOSITION FOR AND METHOD OF HEATING METAL PARTS.—No. 623,239; R. Deissler, Treptow, Germany.

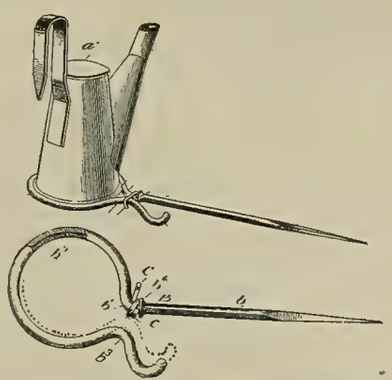
A process of heating parts of metallic objects consisting in embedding them in a reaction mass composed of a finely divided metal having a high temperature of combustion, metal carbide, and an oxygen or sulphur-bearing compound, igniting the mass and after the reaction has propagated itself through the whole mass removing the slag formed thereby.

ELECTRIC ACCUMULATOR.—No. 623,195; A. Werner, London, Eng.



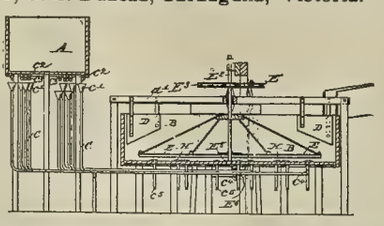
An electric accumulator, being a combination of an electrolyte consisting of a solution of sulphates of magnesium, cadmium and of a zinc with a positive formed of a metallic support on which alloy is electrolytically deposited from such solution and with a negative constituted of a leaden gird having covering fabrics of lead-wire gauze burned to the grid and embedded in the active material on both faces on the grid.

MINER'S LAMP.—No. 623,370; P. Home, Bessemer, Mich.



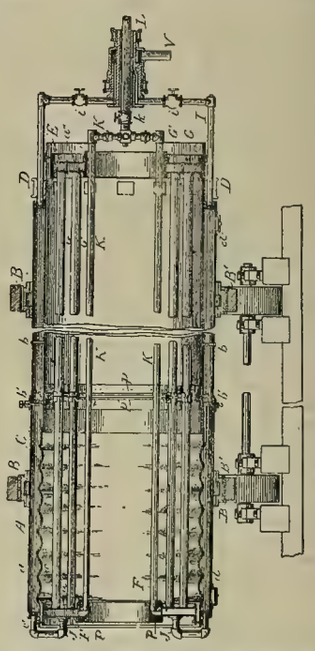
A holder for miners' lamps comprising a shank pointed at one end and provided at the other end with an annular portion grooved on its inner side to engage a bead on the lamp body and a retaining device for securing annular support around the lamp body, and a retaining hook secured to shank and engaging the opposite end of curved portion.

APPARATUS FOR SEPARATING GOLD AND SILVER BEARING SOLUTIONS FROM ORES OR SLIMES.—No. 623,465; G. S. Duncan, Tarnagulla, Victoria.



An apparatus for the separation of solutions of precious metals from residual ores and slimes, the combination with a solutions vat and a leaching and displacement vat placed at a lower level, of a series of pipes having funnel shaped ends arranged beneath the solutions vat, a series of short pipes having valves to discharge from the bottom of the latter vat into these funnel shaped pipe ends; the exit ends of the pipes receiving the solutions having communication with T connections consisting of pipes opening through the bottom of the leaching and displacement vat, their lower ends having removable plugs, a series of stirrers extending radially from a central shaft in vat, and a series of hoods which are slightly arched, the arched portions being placed over the open ends of the pipes entering the bottom of the leaching vat, and arranged at right angles to the movement of currents produced by the stirrers.

ROTARY ORE COOLER.—No. 623,230; Philip Argall, Denver, Colo.



A rotary ore cooler, consisting of a cylinder with shells *A* and *C* inclosing an annular space, hollow heads *E* and *F* within inner cylinder *C*, longitudinal tubes *G* and *G'* connecting said hollow heads, return pipes *K*, *K*, leading from hollow head *F* to a main discharge outlet, means for supporting and rotating cylinder, means for supplying water to annular space and to hollow heads, and means for discharging the water therefrom while cylinder is in rotation. The means for supporting the tubes against displacement consists of annular angle irons secured to inner shell, saddle pieces *p*, double saddles *p'*, intermediate caps *Q*, and suspension bolts *q* anchored to angle irons.

AT Boston, Mass., recently an official test was made on the tug Daniel S. Lamont, of the eophone, an instrument designed to prevent collision at sea. The eophone was some time ago adopted by the United States Government for the revenue cutter service, and is about to be introduced generally. The instrument consists of a vane, shaped like a block of steel rail, on the pilot house of vessel, which is connected with a dial wheel in the cabin by a brass rod. The operator places receivers not unlike those used on a telephone to the ears. When, during a fog, a ship whistle is heard or a reef whistle, the vane catches the sound on the side on which it occurs, transmits it through funnels to the receivers, and the operators, by turning the dial until the maximum sound is reached, can determine to the fraction of a point where the ship or reef is. A whistle can be heard many miles away. The instrument never fails in accuracy. During the tests the exhaust of a tug in the harbor was located when the boat was but a dot on the horizon.

THE report is again in circulation that H. H. Rogers of the Standard Oil Co., acting for a syndicate known as the Copper Combine, is making an effort to consolidate several large copper producers, including the Anaconda in Montana and all the important Lake Superior mines excepting Calumet, and also the Rio Tinto mines of Spain. The syndicate will capitalize for $400,000,000. It is to be an international concern which will control the price of copper in America and Europe. The Rothschilds and Morgans deny the truthfulness of the report that they are underwriting any such project.

A PROBLEM in some manufacturing operations is to get sufficient light at a certain spot, such as upon the die of a drawing press where work must be accurately placed and very quickly handled. A light placed close to the die is often impossible, because it would be in the way or for some other reason. A scientific exchange cites an instance where one machinist got over the difficulty by placing behind and above one of the overhead incandescent lamps a small mirror in such position that the beam of light reflected from it falls directly upon the spot to be illuminated.

THE rise in the price of copper is said to be seriously affecting British industries, particularly the electrical branches, where large amounts of copper are required. The Government has suspended orders for metallic cartridge shells and various industrial concerns are reducing their force.

Some Experiences of a Working Miner.

NUMBER XI.

Written for the MINING AND SCIENTIFIC PRESS.

Did you ever notice that miners are prompt to adopt the latest fads in their line of business? It's so. Let any new thing—a new fashion—present itself in mining, and the miner is quick to seize upon it and works it for all he knows. Just now it is copper. Copper is up and the miner is out for copper—copper of any kind—green, blue, red and black. It is a daily thing now to hear of 90% sulphide ore, and carbonate ore which will go at least 80%; and these statements are made in good faith, too. After a little time it will be something else. A few years ago, when the tin boom was on, tin became so common as to seriously threaten the market, but I notice the tin output is still rather small in the United States. About the time Leadville first arose on its wave of prosperity sand carbonate was all the go. Any bank or deposit of sandy material in the mining regions became sand carbonate in the eye of the optimistic miner. I knew some men who located claims on an outcrop of sandstone several thousand feet in length. A sample weighing sixteen ounces was sent away for assay. In a few days the certificate of assay was received by mail—"sample contains one ounce silver per ton." This was written on a tabulated blank, and in their haste and excitement the "per ton" part was overlooked. The calculation was simple enough. If sixteen ounces sand carbonate contain one ounce silver one ton contains 2000 ounces silver, or over $2500 per ton. The news spread rapidly among the favored ones, and in less than thirty minutes twenty men were in the saddle racing at breakneck speed to reach the wonderful deposit of sand carbonate worth $2500 per ton in silver. Others who knew nothing of what was going on suddenly became aware of the hasty exodus of a certain lot of men and they, too, got animals and wagons and joined in the race. The hot, dusty road was lined for several miles with this small army, many of them on foot, carrying their coats on their arms; and the most amusing part of it all was that the greater number didn't know where they were going and had not the faintest idea what was to be found when they reached the end of their mysterious journey. It just chanced that I was sent to look at this wonderful deposit, and on my return I was obliged to report no sand carbonate, but plenty of sand and very little silver. A closer inspection of the assay certificate revealed the mistake and the stampede was over; but during the brief time it lasted about four square miles of ground was staked out.

One of the late fads is phonolite. Unfortunately, perhaps, but few miners are able to recognize phonolite in its normal condition, and, when altered by crushing and the percolation of mineral solutions to a soft nondescript mass, it becomes very difficult for any one to identify it. Still, the prospector must have phonolite, and the name is liberally and indiscriminately applied to any sort of rock which seems to suit the miner's fancy. Most of these fads, fortunately, do not last long, and the prospector naturally drifts back to first principles and resumes his search for gold. The latest is molybdenite, but this fad is likely to be short-lived.

I took a trip up above P—— to see the dam in the S—— J—— river. The object of this dam was to turn the water through a canal for the purpose of draining the bedrock below, that the stream might be worked for gold. The idea was a good one, but one peculiar circumstance in this connection was that the dam was built just above the mouth of a tributary stream, the flow of water in which was in itself sufficient to defeat the object of the enterprise. You might feel interested in knowing what the final outcome of it was—nothing.

The construction of a large ditch and flume in the mountains involves a considerable outlay of money in the preliminary details. A corps of engineers must go out and make surveys, and sometimes different routes are surveyed. The line having been located, the heavy expense actually begins. Large mining concerns usually fully understand and appreciate these facts; but more than a single instance has come to my notice where errors were made which resulted in the unnecessary expenditure of hundreds of thousands of dollars. When the F. D. M—— mine was in full blast, it was determined to locate a ditch and flume line and construct a canal to furnish a large supply of water for the works. The surveys were made, the line located and construction commenced. Several sawmills were built at various places along the proposed line of the canal to supply lumber and timber for its construction. Several miles of ditch were dug, millions of feet of lumber were put into the flumes. Two tunnels, together about 3000 feet, were driven, and pipe lines located. As far as the work had proceeded, the cost reached nearly half a million dollars, when all work came suddenly to a standstill, though lacking fifteen miles of being completed. In some manner, difficult to explain, it was discovered that water would not disobey the laws of gravitation and absolutely refused to flow up hill in this canal, despite the influence of a wealthy corporation, and the proposition was abandoned.

A great many operations, particularly in the metallurgical field, are based upon insufficient experiment. A few tests are made on a small scale in a laboratory, and, on the result of these, large works for treating ores on a commercial basis are erected. Not long since I visited a plant at S—— constructed with special reference to cyaniding tailings. It was declared that the material contained several dollars per ton in gold, as numerous assays had fully demonstrated, and several experiments had been made with cyanide, some of which were satisfactory and some not so. They built the works, nevertheless, and, after running a week or two, the proposition was abandoned. One thing I noticed particularly in passing through these works, and that was that the water was flowing through the precipitating boxes at a rapid rate, with much evidence of current and many eddies. This may not have occasioned loss, but I fancy it did.

I was taken to see the C—— mine some time ago. It was described as a good prospect, with over 2000 feet of tunnels, drifts, etc., on six veins. I found two tunnels—crosscuts, I suppose, they might be called. Entering the upper one, I soon found it was very crooked, turning first to the right and then to the left, with many branches running out into the country. After proceeding a long distance, I noticed what appeared to be roots in the roof of the tunnel. This seemed strange, as the point I had reached was fully 600 feet from the entrance. I retraced my steps with some hesitation, not knowing whether I was lost or not, but finally reached daylight. I had seen six or seven veins in the tunnel. I went down the mountain about 100 feet to a second tunnel. This I found had been run in the same erratic manner, exposing half-a-dozen veins. It was very confusing, and I concluded to make a hasty survey. This I did, and was astonished to find that both tunnels were run in the shape of a rude crescent, with many irregularities, and, had either been driven a few feet farther, they must have come into daylight at no great distance from the opposite end. It would not be a bad idea to do this, as it would afford much needed ventilation. In place of six or seven veins, I found there were really but two, which the tunnels in their sinuous course had crossed and recrossed several times. The owner of the claims, who did the work, performed it without assistance of any kind, and assured me he "didn't need the mining expert to show him his business." He still believes that each exposure of quartz in his tunnels is on a separate vein.

MINER.

Personal.

W. W. WORTHING, Stockton, Cal., is president Bay State M. Co., Plymouth, Cal.

M. D. ROCHFORD, owner of the Pinkham mine of Chloride, Ariz., is in San Francisco.

CHESTER BRADLEY of Wyoming has been appointed U. S. Collector at the port of Manila.

MGR. SPENCE of the Humming Bird mine at Paris, Idaho, has returned from an Eastern trip.

CAPT. THOS. MEIN leaves San Francisco next week on an Alaskan trip to Douglass Island.

T. A. RICKARD, State Geologist of Colorado, has returned to Denver after a short visit to Virginia City, Nev.

H. W. NELSON, Mgr. Goleta, Montecito and Sterling mines, Jordan, Mono Co., Cal., has returned from New York City.

E. W. MAYBRIGHT of Denver recently made a trip to properties in San Miguel county, Colo., in which he is interested.

S. W. TYLER of Denver, is making examination of mining properties in southern California for Butte, Montana, parties.

W. H. FERGUSON has been appointed Supt. of the Ridenour mines in Mojave county, Arizona, and J. S. McDonald foreman.

E. H. BENJAMIN, Secy. Cal. State Miners' Association, is in Los Angeles attending the Southern Cal. Miners' Convention.

I. S. FOORMAN, Sec. Mokelumne & Campo Seco, Cal., M. & M. Co., has returned from San Andreas, Cal., to San Francisco.

EDWARD S. GREEN has been elected a director of the Boston & Montana M. Co. of Butte, Mont., succeeding the late Charles Van Brunt.

CHAS. G. YALE, U. S. Mint Statistician, has gone to Los Angeles, Cal., to attend today's meeting of the Southern Cal. Mining Convention.

D. R. OLIVER of the Mazeppa mine, Tuolumne Co., Cal., has returned from an extended trip through the mining districts of Sonora, Mexico.

F. ZEITLER, for several years Supt. of the Champion mine at Nevada City, Cal., was re-elected to fill that position at the recent annual meeting of the company.

VICTOR C. HEIKES has been appointed Colorado's special agent of the department of mines and metallurgy for the United States to the Paris exposition of 1900.

ARTHUR P. DAVIS of the United States Geological Survey has been ordered to Panama as an expert to the commission authorized to investigate the Panama canal route.

CURTIS H. LINDLEY is at Kellogg, Idaho, where he is engaged in the preparation of the case of the Bunker Hill & Sullivan Co. vs. the Last Chance, which comes up in May.

W. W. OLDS, formerly of Custer City, South Dakota, will have charge of the 100-stamp mill now building for the Golden Gulch M. & M. Co., near Woodland Park, Colo.

G. F. TIMMS of Price, Utah, is in Washington, D. C., trying to secure from the Secretary of the Interior a lease of the gold and copper ledges on the Uintah Indian reservation.

SAMUEL NEWHOUSE, Pres., and Thos. Weir, Gen. Mgr., Utah Con. Co., Utah, have tendered their resignations. A representative of the copper trust has succeeded to the presidency.

C. E. FINNEY, recently Gen. Mgr. commercial department Con. Kansas City Smelting & Refining Co., on the 1st prox. assumes the position of Gen. Mgr. for M. Guggenheim's Sons, New York.

THOS. N. SMITH, for many years prominently connected with the Utica mine, Angels Camp, Cal., has resigned his position and will practice his profession of mining engineer in San Francisco.

A. SHIERHOLTZ, representing the Risdon Iron Works of San Francisco, is at Virginia City, Nevada, in connection with the installation of the second elevator in the C. & C. shaft, used in unwatering the deep levels of the Comstock.

A. M. ROBESON, late in charge of the Beers, S. A., diamond mines, will on the 1st prox. assume charge of the Alaska Mexican and Alaska United mines. As previously announced, J. P. Corbus will have charge of the Alaska-Treadwell mine.

DR. ROSSITER W. RAYMOND, Clarence King and Waldemar Lingren are at Rossland, B. C., in the interest of the Center Star (War Eagle) M. Co., in the litigation with the Iron Mask Co. Louis Janin, Frank D. Howe and Clayton Miller are also there representing the geological side of the Iron Mask Co.

ALEX STEWART, Gen. Mgr. of the Broken Hill Propritary Co., N. S. W., resigned his position April 1st to accept the management of the Chillagoe Railway & Mines, Ltd., but will remain in touch with the Broken Hill Co. as consulting engineer. Mr Delprat succeeds to the management of the Broken Hill Co.

VICTOR A. CLEMENT, who was formerly associated with John Hays Hammond in the Transvaal, has recently completed an examination of the Yellow Aster mines at Randsburg, Cal., and is locally credited with having concluded a deal by which these mines pass to Capt. DeLamar. The price is said to be $3,000,000.

FREDERICK J. TAGGART, librarian of the Mechanics' Institute of San Francisco, has gone to New York to negotiate with Chas. E. Tripler, who has a process for making liquid air, and also with Nikola Tesla, who has an invention by means of which he produces artificial sunlight, with the purpose of having them exhibit their inventions at the annual fair of the Institute in San Francisco, commencing Sept. 2nd.

Industrial Notes.

—There are 380 saw mills in California.

—San Luis Obispo, Cal., has voted to spend $116,000 on water works.

—The daily wages of Denver, Colo., carpenters has been advanced to $3.

—The Truckee & Tahoe, Cal., narrow-gauge road is to be built this season.

—Humboldt county, Nev., has sold 1,000,000 pounds wool, at 10 cents per pound.

—Humboldt, Cal., lumbermen have increased employes' wages from 10% to 15%.

—Stock is being subscribed for an electric road between Los Gatos and San Jose, Cal.

—California's total lumber output for '98 was 452,641,887 feet. Of this one-half was redwood.

—It cost the Colorado Midland Railroad Co. $75,000 to clear its tracks of snow during the recent blockade.

—The Utah & Pacific Railroad now runs from Salt Lake City, Utah, sixty miles west of Milford to Maderia.

—At Visalia, Cal., the Mount Whitney Power Company calculates power and light will be furnished on the 10th prox.

—A large jubilee celebration at San Pedro, Cal., on the 26th inst., marked the beginning of the work of making a harbor at that point.

—The Booth-Kelly Lumber Co. has bought a large tract of timber land near Coburg, Lane Co., Or., for $120,000, and proposes to build sixteen miles of railroad.

—Globe, Arizona, has granted a non-exclusive franchise to Martin & Brown, for building city water works. The water will be piped from a natural spring in the Pima mountains, eight miles distant.

—The Commonwealth Lumber Co., Buckley, Wash., has for capital stock "1,000,000 hours work, worth $1 each." One share is sold "for such commodities" as the company needs. The incorporators say they expect to make "a comfortable living" out of it.

—A company with $1,000,000 capital has been organized in New Jersey to be known as the Hallidie Wire Rope, Tramway & Cable Co. of Chicago. The incorporators and principal stockholders are A. S. Hallidie and G. T. Gaden of San Francisco and A. J. Warner of Chicago. The company will acquire the several Hallidie patents and manufacture wire and wire rope.

—At Blake's spur, near Huntington, Or., is the point of connection with the Short Line and the new Northwestern Railway, which is being built as quickly as money, men and material can do it. I. E. Blake, president of the railroad, is one of the owners of the Northwest Copper Co., Peacock, Helena and White Monument mines of the Seven Devils country. Twenty miles will be finished by June 15th.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 18, 1899.

623,394.—HAY PRESS—F. V. Burner, Elko, Nev.
623,240.—VEHICLE WHEEL—A. E. ELLIOTT, Modesto, Cal.
623,210.—TOY—E. GIER, S. F.
623,366.—DISH DRAINER—Christine M. Halvorsen, Los Angeles, Cal.
623,211.—CAR COUPLING—G. C. Harlin, Stockton, Cal.
623,402.—WINDMILL—L. K. Hong, Parkland, Wash.
623,215.—STATION INDICATOR—Hunter & Gustafson, S. F.
623,484.—IRONING MACHINE—O. W. Lorbeer, Pomona, Cal.
623,179.—CULTIVATOR—R. Peet, Escondido, Cal.
623,428.—WIND WHEEL—O. Rubarts, Newport, Or.
623,436.—LATERN—J. W. Smith, Portland, Or.
623,439.—WATER FILTER—S. M. Suman, Riverside, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE WHEEL.—Arthur E. Elliot, Modesto, Cal. No. 623,240. Dated April 18, 1899. This invention relates to improvements in the construction of wheels which are designed for use upon vehicles, such as wagons, carriages, buggies or farming implements where such wheels are available. The object of the improvement is to provide wheels for vehicles in which will be found all the strength and rigidity of the middle wheel and its insensibility to the effect of expansion and contraction by moisture or heat, while at the same time the objection of inelasticity is overcome and the felloes can be adjusted with relation to the tire to keep it constantly tight. The wheel is provided with tubular metal spokes, a hub having radial sockets cast upon the inner ends of the spokes, an interior wooden bushing and metal axle box. Metallic tenons project from the outer ends of the spokes and the wooden felloes fit upon these with felly plates bored to fit over the tenons, bolts extending through the tire and the felly plates to lock them in place, and the felly plates have a flat inner surface against which the ends of the spokes abut. A screw-threaded sleeve or thimble fits the exterior of the screw-threaded nuts of the spoke and is turnable thereon to expand the felly and keep the tire tight.

The Genesis of Petroleum and Asphaltum in California.

NUMBER XIV.—CONCLUDED.

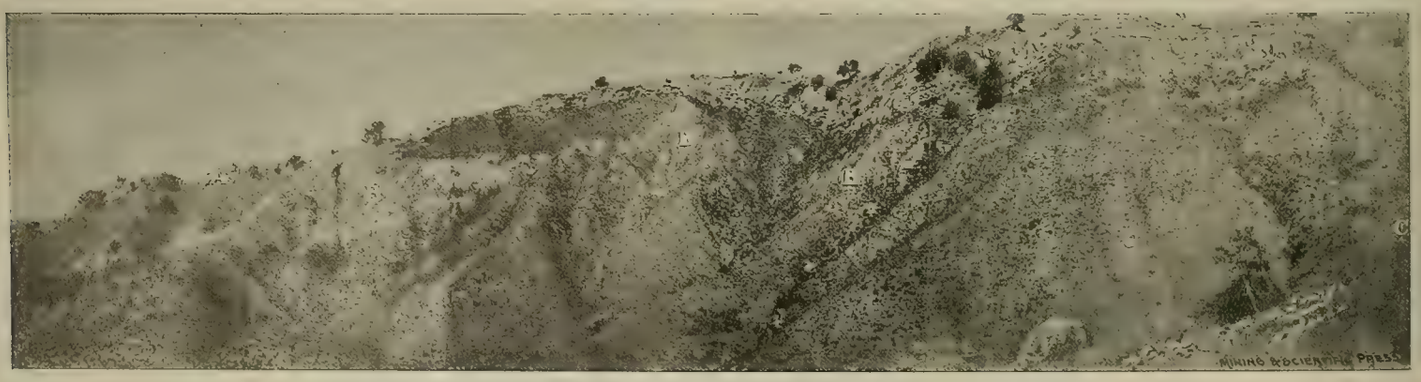
Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

The illustration herewith shows a formation lying east of Zaca creek, in the county of Santa Barbara, California. *A A A* is bituminized sand forming the south dip of an anticline; underlying the bituminous sand are bleached shales *B B B*, and below the shales are metamorphic rocks, quartzite and serpentine. At one point the metamorphic rock has closely approached the bituminized sand. At this point the bitumen has been removed from the sand and the sand is calcified and silicified. From the attending phenomena it would seem that these sands were bituminized before metamorphism reached them.

This sandstone when not reduced by erosion is nearly 300 feet in thickness and, like a mantle, covers a large part of the territory lying between the Santa Maria and Santa Ynez rivers, the Pacific ocean and the Alamo Pintado creek in Santa Barbara county, some 600 square miles. In the summit of the domes and in the dip of the anticlines which are farthest away from the mountains, which are higher than the summits of these anticlines, the sands are sometimes bituminized. Extending toward the northwest from the place shown in the cut are sands containing millions of tons of bitumen. These bituminized sands are very prominent, forming high bluffs. Throughout the area which this upper sand covers there are places where these sands are silicified, in others calcified.

On the south slope of the Santa Maria valley, and in some other places, these sands are uncemented and have been formed into sand hills through the shifting of the sands by water and the winds. Also scattered throughout this area there are a number of sulphur blows, mineral springs, and places where natural gas escapes in large quantities. On the slopes of Mount Salamon asphaltum is injected into the formation surrounding subsidences. Veins of asphaltum also occur on the Jonata rancho. White, leached shales and shales burned to various tints of red occur in large masses. The shales and sand stones in this area are fairly conformable.

On the Sisquoc river there is another exposed sand which is bituminized and which is geologically about 1000 feet lower than this upper sand, and is separated from it by a bed of shale. How thick this lower sand is cannot be positively determined, but judging from its exposures it must be over 300 feet thick. If this sand covers the same area as the upper sand, which it is reasonable to suppose that it does, there is no reason why it should not contain in its domes and the dips of its anticlines millions of tons of bitumen, which, on account of being excluded from the atmosphere, should be in the form of petroleum oil, and which could be obtained by the sinking of wells.



FORMATION LYING EAST OF ZACA CREEK, SANTA BARBARA COUNTY, CAL.

EDMUND DAVY first made acetylene from a compound produced during the manufacture of potassium from potassic tartrate and charcoal, which, under certain circumstances, yielded a black compound decomposable by water with considerable violence and the evolution of acetylene gas. This compound was afterwards investigated by Berzelius, who showed it to be carbide of potassium, and who also made the corresponding sodium compound, and showed that it evolved the same gas.—Australian Mining Journal.

THE London *Statist* compares recent annual reports of the Rio Tinto Copper Mining Co. and miscellaneous statistics for two years:

	1898.	*1897.*
Ores on hand	£671,668	£693,004
Pyrite sold, tons	544,518	575,733
Pyrite treated, tons	820 882	812 293
Copper produced, tons	20,426	20,826
Average price copper	£51-16	£49-2
Development account	167,473	181,113

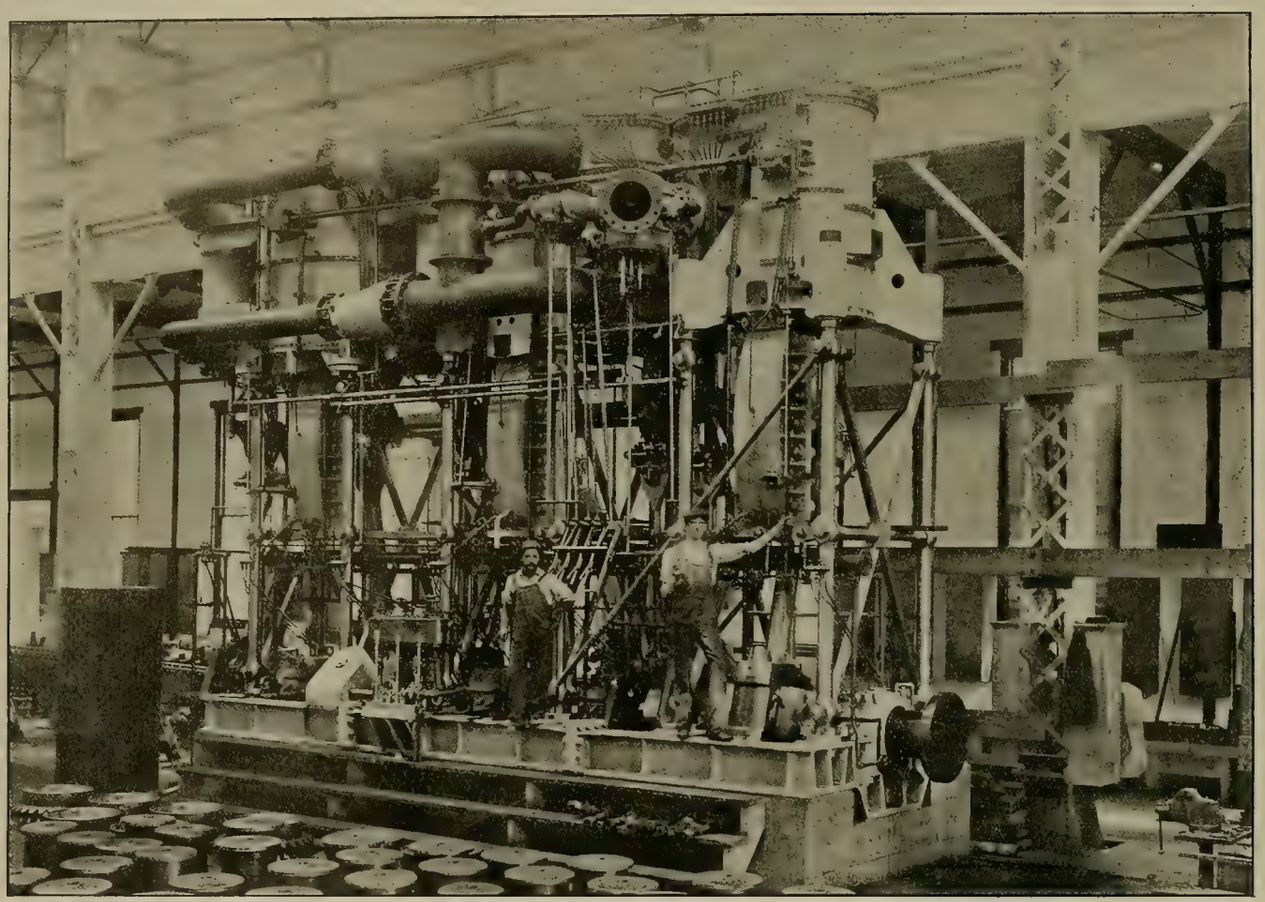
One of a Battleship's Engines.

(*Continued from page 453.*)

guns, and will also carry four torpedo tubes. The arc of fire of the 13-inch guns is about 135° on each side of the center line. Diagonal armor 12 inches thick connects the belt armor and barbettes and extend from the slopes of the protective deck to the top of the side belt on both sides.

The Wisconsin will be ready to turn over to the Government after her trial trip, about Jan. 1st, 1900. She embodies all the electrical features that have been experimentally tried in the older vessels. Her electrical equipment consists of an incandescent lighting system, four large searchlights, apparatus for the operation of two large turrets, electrical ammunition hoists and powerful electrically-propelled fans for the elaborate ventilating system.

For purposes of comparison is also presented herewith an engraving of one of the triple-expansion engines of the battleship Illinois, a shop view taken at Newport News. Both vessels are substantially alike. So far as known this is the first publication of pictures of these two great war machines now building for the U. S. Government, one on the Pacific and the other on the Atlantic shore.



ONE OF THE TRIPLE-EXPANSION ENGINES OF THE U. S. BATTLESHIP ILLINOIS.

Mining Summary.

ARIZONA.

The Tennessee mine at Chloride is reported to have 12 feet of ore at the bottom of a 250-foot shaft.

On the Merrimac at Chloride a crosscut is being run on the 350 level. The company is thinking of putting in a concentrating plant. Mr. Hilty is Supt.

The Great Lead, near the Tennessee at Chloride, has good ore. Parties are figuring to purchase this mine. It is a large vein, carrying 50 ounces of silver and 60% lead.

W. C. Bishop, on a claim on Stockton Hill, at a depth of 30 feet found a small stringer of ore which gradually widened to 4 feet of ore.

It is reported that the Crowned King mine, in the Bradshaw mountains, southeast of Prescott, has a shoot of ore 145 feet long and 10 inches thick, in which the ore is chiefly zinc sulphide and very rich in gold. The mine is extensively developed and has other ore shoots. It has been worked for more than twelve years.

Phœnix *Herald*: Ten of the stamps of the mill on the Bonanza mine at Harqua Hala are to be shipped to Australia by the company that has been operating the property.

Kingman *Miner*: The St. Charles Bros. have bonded the Midnight mine, near Chloride. A shaft will be sunk on the property 200 feet.

Prescott *Journal-Miner*: The Sterling M. & M. Co. has been incorporated to operate the Sterling mine on Big Bug. It is composed of Eastern men.——A mining claim has been located on the outskirts of Prescott by a miner from Nevada. He found some good looking float, followed up the indications discovered and located the ledge; the ore shows free gold.——The Garcia mine near Wickenburg, which has been closed for some time, will be started again. The shaft is down 400 feet and there is a good grade of free ore in the lower drift. Thirty-five men will be employed. New claims are being located in that section.

Prescott *Courier*: Supt. Douglass of the Senator mine is putting in a station 600 feet from the surface, 2400 feet from the mouth of the tunnel, to sink 200 feet deeper.

Tucson *Star*: The deed has passed transferring the Cobrige copper mine from A. Spencer to Huntington & Wellbye; consideration $8000.

Mining Reporter: An important mining district is being opened along the boundary line between Utah and Arizona at Buckskin, Mount Trumbull and Grand Gulch.

Bisbee *Orb*: Bisbee is excited by the discovery of gold-bearing quartz seven miles below town in the main canyon. One group of claims has been located by J. Huber, who has begun work. The quartz is decomposed and iron-stained and shows free gold.

CALIFORNIA.

Amador.

Sutter Creek *Record*: The 900 station in the Lincoln mine, near Sutter Creek, has been completed. The west crosscut from the north drift on the 500 is nearing the ore channel. This is 200 feet farther north and 200 feet deeper than the old workings.——After a long idleness, the Voorheis chlorination works at Sutter Creek will resume operations.

Butte.

Electric power for operating dredges near Oroville is being discussed; it is expected that the Butte County Electric Power & Lighting Co., recently incorporated, will supply this power.

Oroville *Mercury*: The Oroville Water Co. is making additions to the water system, which will supply a great deal more water than is needed at the present time. On the upper end of the main Miocene ditch thirty-five men, under E. H. Bickford, are cleaning the ditch, which has not been cleaned since '90. Seven miles have been cleaned and three miles remain. The lower end was cleaned and repaired last winter. Twenty men are working on the side line known as the Morgan ditch.——Mining in Big bend is increasing and new claims are taken up and being worked in Shield's gulch.——C. Waldeyer, Supt. Buchanan Hill mine, has two shifts driving the tunnel through bedrock and expects to strike the channel in about a month.

Oroville *Register*: A dozen men are employed in the Golden Trout mine, near Mooretown, and the force is to be increased.——At the Cayot mine, on Fall river, twelve men are employed.——B. G. McLain of Magalia, Supt. for a company of San Francisco capitalists, is erecting a hydraulic elevator, at a cost of $20,000, near Cherokee, to work tailings from the old Cherokee mine. Work will begin at the falls and go down stream. They will employ twenty men and 600 inches of water used to run machinery.

Calaveras.

The Kings Co. purchasers of the Bruner mine at Angels have made the first payment of $5000 on their bond.

Jackson *Republican*: V. S. Garbarini, Supt. Sheep Ranch mine, reports 150 feet of the shaft retimbered and as much more remains to be retimbered before the water level is reached. The Pioche tunnel taps the shaft at the 300 level. Within the next six weeks everything will be in readiness to hoist water. Seventy-five thousand brick are to be burned, the brick to be used to set the battery of three boilers. New machinery to sink the shaft 2500 feet deep is at Valley Springs.

San Andreas *Citizen*: It is reported that the Josephine and Black Wonder mines, near Blue mountains, ten miles from West Point, are to be opened. F. Greve is the owner.——There are employed 105 men at the Melones mine, near Robinson's Ferry. It is said that 2,800,000 feet of lumber will be required for the construction of the mill.

San Andreas *Citizen*: W. H. Clary, formerly Supt. of the Sheep Ranch mine, has a bond on the Flamm mine, near San Andreas, and will develop it.——The Satellite mine at Campo Seco, owned by J. K. Harmon of Chicago, employs thirty men. It has been idle seven years. A forty-ton water jacket furnace is being erected under the direction of Mr. Fowler of Denver, Col. Mr. Randall is Supt. of mining operations. O. Borger is working half a dozen men on an extension of this property.

El Dorado.

W. S. Graham is surveying the Ralston Divide drift mine, owned by a French company, located twenty miles above Michigan Bluff. Men are getting out timber for additional buildings.

Inyo.

The Rip Rap mine, near the Jo Walker mine, is being reopened by G. H. Smith and others of Pasadena, Cal.

Los Angeles *Mining Review*: Kitchline & Walker of El Paso district have put up a cyanide plant at Old Coso, near Darwin, where they bought 4000 tons of tailings which had been run through arrastras. The tailings will run $10 per ton.

Randsburg *Miner*: The P. D. Q. Cyanide Co. have about 10,000 tons of tailings, thirty miles east of Independence, and will put up a large plant at that place. There are several other lots of tailings in that neighborhood which they expect to work.

Kern.

It is reported that the Yellow Aster mines at Randsburg will be transferred to a French syndicate represented by Captain DeLamar, the consideration being $3,000,000.

Porterville *Enterprise*: J. L. Hooper is preparing to work the Big Blue tailings.——The tailings from the Harley mill are being treated by the cyanide process.

Los Angeles *Mining Review*: D. Hirschfeld of Bakersfield, who is working claims seven miles west of Randsburg, has ore enough on the dumps and in the mines to keep five stamps running many months.——At the Hard Cash mine, west of Randsburg, a force of men is taking out ore, which is treated in the dry concentrator.——It is reported that the Butte property has been sold to the Little Butte Co. and that the latter are negotiating for the wells and water owned by the Johannesburg Water & Townsite Co. If successful in the above deals they will put up a 15-stamp mill at the mines, in Randsburg, or at the pumping station in Johannesburg.—— The Good Hope people, who bought the Eureka 2-stamp mill, are keeping it running day and night. This mine will make a record this year.——The Johannesburg mill is running five stamps on ore from the Butte dump, and the other five on ore from beyond Garden Station. This latter is base and the tailings will be cyanided. The cyanide plant has made its first big cleanup.

Randsburg *Miner*: Woods & Waite, owners of the gravel diggings near St. Elmo, are having fifty tons crushed at the Barstow mill. A second shaft is being sunk. Other parties are getting good prospects. Some gravels assayed $40 per ton.——C. C. Boles, who has been leasing on the Minnehaha, had five tons of ore crushed at the Red Dog mill which returned $300.

Los Angeles.

It is reported a milling gold vein has been found in the San Gabriel mountains, northeast of Pasadena.

Madera.

(Special Correspondence).—There are some small high-grade veins in granite near Grub gulch which warrant development. Most of them have some development. There are also some good prospects on Potter ridge and near Coarse Gold. The ores are quartz, carrying free gold and auriferous iron sulphides. Galena also is found.

Coarse Gold, April 20th, '99.

Mariposa.

Sonora *Democrat*: The Copper King mine near Mariposa has been bonded to C. K. Thorburn of Sonora. There is a 65-foot shaft and a 60-foot tunnel on the prospect.

Nevada.

The Orleans M. Co. at Grass Valley has decided to resume operations. C. H. Brockington is Supt.

Auburn *Republican*: W. D. Pinkston is preparing to build a 20-stamp mill on the St. Patrick claim at Washington. The mill is from the Taylor mine, near Greenwood, El Dorado Co. Mr. Pinkston has a 90-foot ledge of low-grade ore.

Placer.

Colfax *Sentinel*: Supt. Felix Chappellet, Jr., at the Eureka Con. drift gravel mine, is drifting to drain the channel struck in the upraise. They expect to reach it in a few days. The Eureka, when opened, will employ 300 men. The company owns six miles of channel. ——During the heavy storms in March the pumps at the Herman mine near Deadwood were not able to handle the water and the shaft was filled. The new pumps will have sufficient capacity. Tunnel No. 5 cut the ledge at 1308 feet. A drift has been run south on the ledge 45 feet.——The Blue Canyon M. & D. Co. have their Azalea tunnel in 1430 feet. This tunnel is being run for a gravel channel. Quartz veins have been struck in the tunnel through the bedrock.

Auburn *Republican*: At Whisky Diggings, near Lincoln, the day shift in the copper mine, located near that place, took out $1500 worth of copper ore in one day recently.

Riverside.

San Bernardino *Sun*: The Virginia Dale mines, which were "jumped" on New Year's morning, will be held by the original owners. Judge Oster rendered a decision recently against the new claimants on two counts: First, the evidence shows that the owners of the property in '98 did $100 worth of work; and, second, that the claim jumpers did not make their title good, for the reason that they did not complete the location as required by law, and do the requisite work within sixty days from the date of the first location notice.

San Bernardino.

(Special Correspondence).—The Alvord gold mines, twenty-three miles northeast of Daggett, are being gotten in shape, under the direction of Gardner H. Smith of Pasadena. The property comprises a group of claims on a zone of calcite 200 to 600 feet wide, in which occur large masses of limonite. The iron and calcite are gold bearing. There are several thousand feet of development on the property.

Daggett, April 23d, '99.

Harrison & Godsmark, the owners of the Radcliffe mine in the Panamint range, are arranging to add five stamps to the ten in their mill. They have put up a cyanide plant. The mill is 4000 feet distant and 1700 feet below the shaft of the mine, and the ore is carried by tramway.

Ten miles southeast of Kramer three prospectors—Duncan, Clarke & Goldsberry—report a ledge 180 feet wide traced for half a mile, containing free-milling gold. The miners found it by dry-washing the lateral gulches leading to it and sinking a shaft 52 feet.

San Diego.

It is reported that S. Black of San Diego has found rich gold ore in his claim at Mesa Grande. There are several partially developed locations in the Mesa Grande district, and some rich quartz has been found at various times, but no systematic work has ever been done. The Shenandoah, one of the most important, was equipped with a 5-stamp mill. The district is a northwesterly extension of the Julian-Banner belt. The formation is chiefly mica schist, with numerous veins of coarse granite, in which black, green and red tourmalines occur, and in some localities also violet-colored lepidolite.

Shasta.

At Bragdon Moore & Nordstrom are reported to have made an improvement in catching both fine gold and black sand. "New Brussels carpet is laid in two 12-foot sluice boxes, laid at 7 inches grade to 12 feet, and a strong head of water run. Near the lower end of the lower box is a ½-inch undercurrent cut across the full width of the box and covered with fine wire screen, and the undercurrent box is laid with common grain sacks. The carpet in the two boxes catch all the gold and a little black sand. The undercurrent box catches the black sand by sweeping it off three to four times per day; if allowed to go too long without cleaning, the sand cakes and it does not save it at all."

It is locally suggested to bond the townsite of Shasta for mining the ground on which it stands. It is a remnant of placer ground left undisturbed since early days.

Shasta *Free Press*: H. C. Woodrow has been investigating the Bacchus, Trinity and the Butler mine on Dog creek and has shipped a car of ore from the Bacchus to the Keswick smelter.——It is reported that the Trinity mine is to be opened by the Bank of Shasta county.

Shasta *Courier*: A strike was made recently in the Capitol mine near Shasta, owned by Sheriff Behrens. In sinking, a 2-foot vein of free-gold rock going $60 per ton was found.

Siskiyou.

Yreka *Journal*: Baker & Co., who bonded the Gumboot quartz mine at Scott river, are finding good quartz in prospecting.——The Greenhorn Blue Gravel mine continues to yield handsomely; the ground now worked seems the richest yet found.——At the Rostel & Nehrbass ground, at Greenhorn, new machinery will be put in to get to bedrock.——C. V. Herman has discovered chrome ore in his land on Yreka Flats, west of town, a few feet from the surface. An assay of the chrome ore a few years ago returned $12 in gold and $3 in silver to the ton.——Austin & Co. are finding good pay on Yreka Flats; also more water for pumping into the sluices.

Yreka *News*: The Commodore mine, thirteen miles northeast of Scott's Bar, is running night and day, and good ore is being crushed.

Yreka *Journal*: The ledge in the New Klondike district on the Scott Valley road, three miles south of Yreka, is 40 feet wide, but is opened only by shallow cuts.——The Greenhorn Blue Gravel mine since working north in the claim under John Garvey has produced $12,000.——In Little Humbug there is a good supply of water and B. B. Jackson, Rider & Fabricius, Everson Rider and others are sluicing pay gravel.——Austin & Co. are taking out pay drifting their claim on Yreka Flats.——The new mill at the Cape mine on Greenhorn creek will be ready in three weeks.

Del Norte *Record*: There is unusual activity in mining in Happy Camp.——A body of ore has been found in one of the old crosscuts of the Union copper mine at Low Divide. It is 4 feet in width.

Trinity.

Redding *Democrat*: The Copper Queen mine, situated three miles east of Carrville, and owned by Baker, Vollmers and Dimmick of Trinity Center and E. Ellery of Redding has been sold to Napa capitalists. The new owners will erect a 40-ton smelter.

Redding *Searchlight*: H. Brown of the Bank of Napa and Schuppert & Buckman, also of Napa, owners of the Old Spanish mine, have bought the Copper Queen, five miles from Trinity Center and one mile east of Carrville. They will put in a forty-ton smelter.

Tuolumne.

Sonora *Democrat*: A tunnel has been driven 80 feet on the Black Horse, near Coulterville, cutting a 6½-foot ledge.——A carload of high-grade ore from the Densmore, near Sonora, has been shipped to Selby.——The Pedro Bros. have another pocket from their Bald Mountain claim. This time it was $1000, one specimen weighing twenty-nine ounces. Ore is being hauled daily from the Vine Spring mine, near Columbia, for shipment to Selby. ——At the Buckeye, near Coulterville, a shaft is being sunk on a 2-foot vein that it is reported will mill $80 per ton. The mine has a steam hoist and 4-stamp mill.——Work has begun on the Gerrymander at Sonora with three shifts. The shaft will be sunk 200 feet deeper.——A concentrator has been placed in the mill at the Temescal mine, near Sonora. In the past the sulphurets, which are high grade, have been wasted.——Sinking has been resumed in the Black Oak shaft, near Soulsbyville, now down 750 feet. It will be sunk 100 feet deeper, where a station will be put in and the eleventh level established. Two 10-inch pumps keep the workings free from water with a five-to-the-minute stroke.

Sonora *Independent*: J. Long has sold his mine to the Good Luck M. & M. Co., represented by Willey, Roderick & Greely of Monterey and Santa Cruz. The property is east of the Mammoth mine, near Jacksonville.——Fifteen tons of ore taken from the Vine Spring mine, near Columbia, will be shipped to Selby's Works.——The Densmore mine is reported shipping sulphurets to the same place. ——At the Anaconda mine, near Columbia, the shaft is down 104 feet and a level is being started. A survey for a tunnel has been made.——The Gerrymander mine at Sonora has started up with a force of ten men. The shaft will be sunk. J. Josephs is Supt.——Pumping is in progress at the San Guiseppi mine at Sonora under the superintendency of Dr. Drake. When the water has been removed development will begin.

COLORADO.

BOULDER COUNTY.

In crosscutting at the Mammoth another vein has been uncovered, 40 feet beyond the Black. It is mineralized and broken up.

Redding & Co., working the Freeland Extension, have found a rich free-gold streak near the surface in the first level west of the shaft.

The Amenda M. & M. Co. has taken a new lease and bond on the claims at Empire station, and a contract was let recently for 50 feet of crosscutting.

Representatives of the Princess of India tunnel, at Lawson, have big bodies of milling ore opened through the tunnel of the Monarch vein, and expect to lease the mill at Lawson.

The Cold Spring M. Co., recently incorporated to operate mines at Red Hoss mountain, it is reported, will build a large mill. The incorporators are Illinois men.

Ward *Miner*: The Hanna M. & M. Co. has secured the Gold Crystal mine, on Modoc hill. They will first sink the shaft 200 feet deeper. ——W. Barrett has given an option to the Ward Pyritic Smelter Co. on his Copper Glance group of four claims on Four-Mile creek, half a mile above Sunset.

CLEAR CREEK COUNTY.

Idaho Springs *Gazette*: The Seventy-Six M. & M. Co. has been incorporated for $50,000 to work the mine of that name near Dumont. The incorporators, with the exception of a local representative, are Chicago men. The mine is developed by a tunnel; a contract has been let to continue the tunnel.——Pease, Holladay & Co. have been developing the Nabob mine, on Silver creek near the Jo Reynolds, for years, and have ore in one of their drifts. They have opened it for 60 feet. The streak is from 4 to 6 inches thick.——The machinery at the Seven-Thirty mine, covered by the snowslide in February, has been uncovered and found uninjured. Forty men have gone to work in the mine.

Denver *Republican*: C. E. Stubbs of Denver has resumed in the Perkins tunnel at Idaho Springs. A contract is to be let.——G. Williams has found a mineral east of the shaft which is being sunk on the Teller lode. The pay streak shows sulphurets and is 3 feet wide. It is a surface pocket. Two feet of mineral has also been found on the west side of the shaft.

FREMONT COUNTY.

The owners of the Sentinel mine, at Dawson, near Canyon City, have a body of ore the gangue of which is streaked with pure copper.

A steam hoist is being installed on the Metallic King, Greenhorn district, near Canyon City. The ore shows copper and gold. The property is owned by a Galveston company.

GARFIELD COUNTY.

The Colorado Fuel & Iron Co. are to open the coal mines of Coal Basin and will build a narrow gauge railroad to the mines. Coke ovens will be built at Redstone.

GILPIN COUNTY.

Denver *Republican*: In March the Cook M. Co. shipped 2000 tons of ore, which produced 360 tons of concentrates; also 126 tons of smelting ore. During the same period the Concrete mine produced 1050 tons and in three weeks the Kansas-Burroughs Con. M. Co. shipped 2100 tons.——Sinking 100 feet at the Galena mine on Central hill is in progress, which will make it 650 feet deep. The property is owned by the Alpha G. M. Co. of Detroit, Mich.——The Cook and the Fisk mines on Bobtail hill are handling a good deal of water. In the former sinking is being carried on with three shifts, hoisting 250 buckets of water daily. The Fisk mine is working sixty men and its daily product is fifty tons of mill and smelting ore.——At the Queen of the West mine in Chase gulch three shifts are sinking and a depth of 685 feet has been reached. A cross vein was struck a few days ago in the shaft. The property is being worked by H. J. Stephens of Denver, the owner, who has done only development work this winter.

GUNNISON COUNTY.

Denver *Republican*: The Taylor Park M. Co., which had devoted itself to its placers, entered the lode mining field last fall and let a contract for 500 feet of tunnel on a lode at

the head of Tellurium creek. At the depth of 150 feet from the surface a large body of ore was found and a drift run 80 feet on the vein. The ore averages $65 per ton. The tunnel will cut the vein at greater depth and shipping will commence. Machinery is to be put on the property.——A rich strike is reported in the Napoleon of Pitkin district. A drift from the 300 level opened a 17-foot body of low-grade ore, and another drift at the 240 level has cut an 8-foot vein that will average 50% lead, 100 ounces silver and some gold.

HINSDALE COUNTY.

Lake City *Times*: C. C. Bruner, in charge of the Japanese group on Copper creek, in Burrows Park district, has a 7-inch streak of ore in a drift, an assay of which showed 500 ounces of silver, 1.5 ounces in gold and 7% in copper.

LAKE COUNTY.

The Home M. Co. of Leadville, which is pumping out the down-town mines, has reached the lower levels. Some properties are preparing to take out ore, and in the next month 500 more men will be at work in Leadville.

At the Moyer mine there is trouble over a reduction of wages on their trammers. They employ fifteen men in this capacity and have been paying $3 a day. This was reduced to $2.50. It is the same wages that most of the trammers in this camp are receiving. When notified they must accept $2.50 per day, they quit work. The Moyer resumed operations a year ago, and, after pumping out a large amount of water, began six months ago shipping regularly from 150 to 300 tons per day. Their product is low-grade silver ore. The places of the striking miners have been supplied with new men.

Leadville *Miner*: Mansfield Bros., working a sub-lease on the Crown Point, have opened in the third level a body of high-grade oxide iron 30 feet thick, besides a body of lead carbonates from 1 to 8 feet thick.

Leadville *Chronicle*: It is reported that the company which purchased the Colonel Sellers mine has a smelting scheme that will enable it to treat the zinc in its ores, which are associated with pyrite.

Leadville *Miner*: It is reported that a new ore body has been found in the Little Prince shaft of the Big Six on the north slope of Breece Hill. The shaft is to be enlarged and sunk deeper. This is the fourth important find recently made in that locality. The ore is gold bearing.——The Maid of Erin and Henriette mines at Leadville have been leased by D. H. Moffit et al. to S. D. Nicholson for ten years. The mines have been large producers. All the workings below the 300 level are flooded.

MINERAL COUNTY.

Creede *Candle*: The pumps and mill of the Co-operative mine at Creede are to be started. There are 40,000 tons of ore ready for treatment. Shipments will be increased.

MONTROSE COUNTY.

Uraconite, yellow sulphate of uranium, has been identified as one of the mineral species of Sierra La Sal. As the mineral is derived from the alteration of pitchblende, the Georgetown *Courier* thinks the discovery of the latter may be anticipated.

OURAY COUNTY.

Ouray *Herald*: In the Calliope mine, at the face of the tunnel, in 1500 feet, a new shaft is being sunk which is down 65 feet. An additional force will be put on. The vein is rich in wire silver.——The Sim Noel mine, a short distance from the Calliope, has a tunnel 100 feet and a 4-foot vein is being worked.

SAN JUAN COUNTY.

Silverton *Standard*: The Empire tunnel was started on April 1 last, and on April 15 had been driven 800 feet—a daily average of nearly 8 feet.——B. A. Taft will put a steam pump in at his Gem claim, at Bear Creek, and continue the shaft 20 feet deeper and drift on the lead, which shows petzite.——The Sampson mill produces three tons of concentrates daily.

The Red & Bonita Mountain G. & S. Co. has been developing the past two years and has opened up a number of veins, showing heavy bodies of low-grade ore. The property is owned in Quincy, Ill., and it has been decided to construct a mill. The contract for machinery was let to the Gates Iron Works of Chicago and the mill is to be ready in three months. The property has 3800 feet of tunnel and it is reported that there are 25,000 tons of ore in sight that will yield $15 per ton in gold, silver, copper and lead. The company has expended $50,000 in development and the 100-ton mill will cost $25,000.

SAN MIGUEL COUNTY.

Denver *Republican*: John Morton of New York, president of the Fortune M. Co. of Bridal Veil Basin, Telluride district, has gone to New York. The Fortune has been working a small force during the winter and as soon as Mr. Morton returns the force will be increased.

Telluride *Journal*: D. Martin has made a strike in the Silver Tip mine, near Ophir, the quartz showing gold.

Telluride *Examiner*: The Waterloo owners are arranging for a mill of twenty stamps. About 1500 tons of ore are on the dump. In the ground opened by the 700-foot tunnel and 112-foot shaft is a large ore supply.

SUMMIT COUNTY.

The high price of lead has had the effect of causing preparations to be made for working the lead-silver claims about Montezuma, many of which carry from 50% to 70%.

In Frisco the finding of veins carrying from one to ten ounces in gold has insured the permanency of the camp. Since the first of this month the mayor and council have sold lots, the proceeds to go into the town treasury for town improvement.

TELLER COUNTY.

The large air compressor in the new electric light plant at Goldfield is in operation and will supply water for drills used in mines belonging to the Smith-Moffat syndicate.

A strike is reported on the Mitchell lease on block 4 of the Orpha May No. 2 at Cripple Creek which at a depth of 40 feet 10 inches of ore was opened up which runs from two to twenty ounces. On the Keith and Grube lease adjoining a good vein has been opened.

Denver *Republican*: Gold hill is receiving more attention than for some time. C. Johnson has made a strike on the Half Moon of the Matoa Co. The International Gold King reports a find of sylvanite ore.——The Jerseyville Leasing Co. has the Grace Greenwood under lease and has an ore body 24 feet wide.——Two machine drills are now in use at the East Porter Gold King, a small compressor having been added to the plant by the new lessees. The first shipment from the Phillips lease on the same property is being prepared. At a depth of 60 feet they have an ore body 1 foot wide which carries sylvanite and free gold.——A strike on the Steelsmith lease on Findley is reported in the fifth or 400-foot level, where an ore body 4 feet wide has been cut, from which samples vary from $26 to $50 to the ton.——A shipment of smelting grade ore has been sent from the Elgin lease on the Republic of the Mary McKinney Co. Sinking is in progress, the present depth being 300 feet. A new level will be started at 325.——A good find has been made by Horan and associates, leasing on the Deadwood at Victor. Horan & Co. have worked this block for eighteen months without having found ore.——The Murphy mill, near Victor, is to be started up. Everything but the roaster will be in position.

IDAHO.

At Wallace A. B. Campbell has bought a three-sixteenths interest in the Sixteen to One group for $25,000.

The Lucky Boy mill at Custer, which had been closed during the winter, will soon start up.

Buffalo Camp is on the Bitter Root forest reserve and liquor dealers have been served by Forest Supt. Glendening to remove their stocks of goods from the reservation within twenty days.

At Wardner the Miners' Union demand that the Bunker Hill & Sullivan Co., employing 300 men, advance wages to $3.50 all around and recognize the union. The company is paying $3 and $2.50. The managers are willing to advance wages to $3.50 for miners and $3 for car men and shovelers, but will not recognize the union.

A company has been formed to run a long tunnel into the mountain on which the Big Buffalo group are situated. It will reach a point 2000 feet below the apex of the hill. The plans of the company include the installation of an air compressor and drills. Work is to begin as soon as the snow has gone. M. W. Musgrove is Mgr.

The Black Jack mine near Silver City has been shut down pending proposed unwatering of the property.

Boise *Statesman*: There is much controversy over the alleged depreciation of the Big Buffalo ore in depth. It is asserted that the report that values were falling off was circulated by the men holding the bond. The owners have since visited the mine and samples taken by them are claimed to show an increased richness of the ore with depth.

Cuprum *Standard*: A contract has been let by the Northwest Copper Co. to F. Algers for the sinking of a shaft on the Peacock mine 100 feet. F. Pierce is Supt. The shaft will be sunk on new ground in a cut run on the ledge from 30 to 40 feet wide and 30 feet deep. Ten men will work on eight-hour shifts.

Grangeville *Press*: The Dewey mine on the Clearwater has been bonded for $16,000.

MICHIGAN.

The following table gives the annual production of the Lake Superior copper mines in long tons since 1845:

Year.	*Tons*	*Year.*	*Tons.*
1845	12	1872	11,961
1846	26	1873	13,433
1847	213	1874	13,327
1848	461	1875	16,089
1849	673	1876	17,085
1850	672	1877	17,422
1851	770	1878	17,719
1852	792	1879	19,129
1853	1,297	1880	22,204
1854	1,819	1881	24,363
1855	2,593	1882	25,439
1856	3,666	1883	25,439
1857	4,255	1884	30 961
1858	4,088	1885	32,209
1859	3,985	1886	36,124
1860	5,388	1887	33,941
1861	6,713	1888	38,604
1862	6,165	1889	39,364
1863	5,797	1890	45,273
1864	5,576	1891	50,992
1865	6,410	1892	54,999
1866	6,138	1893	50,270
1867	7,824	1894	51,031
18 8	9,346	1895	57.737
1869	11,886	1896	64,073
1870	10,992	1897	64,858
1871	11,942	1898	78,014

Boston *News Bureau*: The strike is still on at the Tamarack-Osceola mills, near Houghton, and will continue unless employes are given 10% raise all around. Mills were started, but forced to close down at 3 o'clock on account of firemen quitting.——The Atlantic M. Co. has struck the Baltic lode on its section 16 and found it copper bearing. Explorations were begun many months ago on this property and a crosscut driven southeast in search of the lode. Atlantic drove the crosscut to the Baltic mine and the Baltic has since continued it.

MONTANA.

Dillon *Examiner*: The first carload of copper ore from the Goldsmith mine at Argenta has been shipped to Butte. The ore goes 25% in copper. French Bros. are operating the Goldsmith mine under a lease from W. A. Clark.

Helena *Independent*: At the Granite and Bimetallic mines more men are being added to the payroll.—The Watseka mine at Rochester is being reopened by leasers and new machinery being put in. A new shaft is to be sunk 400 feet.——The Clark mill will start up May 1st.

NEVADA.

The second elevator attachments below the 1850-foot level in the C. & C. shaft on the Comstock at Virginia City will be soon in operation. It is confidently expected that with this the water will be held at a point 130 feet below the 1750 level until the one in the other compartment is lowered 200 feet deeper. Mgr. Ross reports the elevator working steadily. His last report, dated the 27th, says:

"VIRGINIA, April 27th, '99.

"Elevator working steadily. Water in the 1750-foot level winze is 34 feet 4 inches below the station."

At the gold mining camp in Jumbo district, west of Mount Davidson, a 4-stamp mill operated by steam was built last fall near the Selby mine and has been in operation two months, crushing ore from the Selby mine. The place is called Selbyville.

The London mine, owned by R. Fulstone of Lovelock, has been opened by a 500-foot tunnel and a lot of ore is on the dump.

Twenty-five men are employed in mining and prospecting in the district.

At Pine Grove the Wilson Leaching Co., a Salt Lake concern, J. J. Blake Supt., has been operated a year, with a capacity of sixty-five tons of tailings daily. The plant consists of twelve steel tanks, twenty-five tons each. The ore is chiefly sulphurets.

At Pine Grove, Esmeralda county, the Wilson Leaching Co., under the superintendency of J. J. Blake, has been in operation a year with a capacity of working sixty-five tons per day.

The Virginia City Miners' Union has appointed Messrs. Mack, Young, Bravin, Fallon and Rodgers a committee to handle funds for the Home of Disabled Miners. All money contributed from that jurisdiction can be deposited in the Hibernia Bank of San Francisco. The sum of $12,923.80 has been collected already.

A Reno dispatch reports the purchase of a group of Pyramid Lake mining properties by a San Francisco mining engineer, acting for Eastern men, for $150,000.

Dayton *Times*: E. H. Dickie, of Unionville, will erect a leaching plant at Como for Logan & Hully. Mr. Dickie has tested the ore by his process, and believes he can get a high per cent of the values. He thinks he can cyanide considerable of the ore without crushing it.

Lovelock *Tribune*: George Lovelock reports that he has bonded his nickel and cobalt property in Churchill county to Los Angeles parties. They will expend $50,000 in development.

NEW MEXICO.

Santa Fe *New Mexican*: The Jarillas mining camp is in Otero county in a range of foot hills two miles wide and fifteen miles long. For twenty years it has been known that the Jarillas contained deposits of low-grade ore and that occasional specimens of high-grade gold ore and turquoise were found, but lack of fuel, water and transportation delayed development. Ffteen years ago $50,000 was spent in search of turquoise and high-grade ore, but was abandoned. Tiffany of New York, entirely abandoned the camp after spending a fortune. One claim upon which he spent $80,000 mining turquoise is now considered valuable for low-grade gold ore. It is known that the immense vein of trachyte in which he found small seams of turquoise yields about $4 per ton in gold and is considered a promising cyanide proposition.

Santa Fe *New Mexican*: A. M. Crosier at his claim, The Copper King of the Sacramentos, five miles from Alamogordo, has three carloads of ore on the dump, giving an average of 33⅓% in copper to the ton, with a trace of gold and silver. It is taken to Alamogordo on burros.——The Timber Peak M. Co. has started its new mill. It and the mine are lighted by electricity. A hundred men are employed at the mill and the mine.——A rich strike is reported from the old Graphite mine at Kelly, and the mill at that place will be put into operation.——The Camasair tunnel, near Elizabethtown, owned by Conly & Marcati, on Bitter creek, is in 514 feet. A number of leads 2 to 8 feet wide have been cut, also a large one of sulphide ore. Two shifts are at work.——The Fraser copper mines on Rio Hondo have been leased to a Montana syndicate for $100,000.——The Moreno Placer M. Co. has started operations.——Around Elizabethtown, mines idle for two years are being worked again, and new machinery is being placed in that district.

OREGON.

Baker City *Republican*: The Bonanza mine produces $20,000 to $30,000 monthly. For ten years it was a failure financially.

Baker City *Democrat*: A rich free gold ledge has been crosscut on the 500-foot level, south, in the Flagstaff mine, eight miles east of Baker City, and an 8-foot ledge of high-grade ore has been crosscut on the 200-foot level north from the discovery shaft.

SOUTH DAKOTA.

The new concentrating mill at the Bismarck mine, Keystone district, has started up. It has a capacity of 200 tons daily.

Wolframite is found in a 2-foot vein in the Durango and Harrison mines at Lead City, near the Homestake mine.

Deadwood *Pioneer-Times*: The American M. Co. will not do anything further in the Dacy shaft, at Ragged Top, until pumps are put in, as the water is coming in faster than the men can bail it. J. Medill is Supt.——A vein of ore has been found on the Agate group of claims belonging to O. W. Matson of Deadwood, situated on the divide between Blacktail gulch, Polo creek and Falsebottom. A force of men are sinking a shaft.

Keystone *Miner*: The Holy Terror Co. is putting in an air compressor and has commenced sinking 200 feet in the main shaft. When finished they will place at the bottom the largest pump in the Southern Hills.

Custer *Chronicle*: The Holy Terror Co. are adding to their plant.——The Tungsten mine, near Custer City, is again being worked. The shaft is down 110 feet.

UTAH.

Salt Lake *Tribune*: The controlling interest in the York properties at Bingham has passed to J. Chipman, it is reported, on a basis of $100,000 for the whole capital stock.——The syndicate by which 1,600,000 of the 2,000,000 shares of stock of the Dalton & Lark were recently tied up, has, it is reported, tied up the Antelope group, adjoining. It has been prospected to a depth of 600 feet. According to surveys that are being followed by the Bingham tunnel, the Antelope will be the first with which connection is made at a depth of 1300 feet.——Unexpectedly, the new shaft of the Showers Con., at Diamond, has cut the vein at a depth of 200 feet.——At the Cigale West Dip a stratum of dolomitic limestone, that had been recognized as the footwall, has developed into the most productive portion of the vein, free from refractory properties, which renders the roasting of the ores unnecessary. It has been prospected for 30 feet at several places upon its dip.——At the Gold Dust at Mercur, in the main workings, a breast of cinnabar is exposed.——P. T. Farnsworth of the Washington mine at Frisco is shipping high-grade ore to Salt Lake.——The Peruvian mine at Alta has found ore. Twenty-five men are employed in camp. Snow is still deep, and numerous shipments of ore are waiting for better roads.——It is reported $200,000 has been offered in Boston for the Montreal copper mine, near Milford. The property of the Cactus M. Co. at Frisco has also been bonded.——An Eastern party has gone to the Colorado river to investigate placer deposits.——The old Lehi mining district has been reorganized, with P. Evans as recorder.——At the Dragon iron mine, Tintic, M. Weir will commence sinking a three-compartment shaft 1000 feet.——There is reported at Richfield a rich strike in the Annie Laurie mine on the Senator Stewart claim of the Annie Laurie group. The tunnel on the Annie Laurie follows a vein of gold ore for 400 feet. The vein is 19 feet wide. The strike is in a cut running from the tunnel.——The machinery for the new smelter at the Apex mine near St. George has arrived. It has a 10 H. P. gasoline engine, and will produce about four tons of bullion a day.——In the Green Chloride mine, Camp Floyd district, milling ores have been found and a contract for another 100 feet of work will be let.——J. J. Daly has had a preliminary survey made for running a spur of the Union Pacific as far as the Ontario tunnel. Mr. Daly is also looking for a site for a sampler to handle ores from the Daly-West mine.——A new shaft is to be sunk on the Joe Bowers ground at Diamond, Tintic district. The present workings are on disputed ground.——C. Ford is superintending the construction of the new mill at the New Mammoth, Bingham. When the plant is in operation, Mr. Ford will leave for the property of the Idaho M. Co. in Idaho, where he will build a mill, and that completed will go to California, where he will make additions to the mill on the Ivanhoe mine near Plymouth.——The new hoist on the Congor at Bingham is completed. Three shifts were put on in the mine.——The retimbering of the shaft of the Blue Bird at Diamond, Tintic district, has been completed and sinking resumed.

WASHINGTON.

A shaft is to be started on the Sampson at Republic by Supt. Pearson. The vein is 5 feet wide, as shown by a number of openings.

The Young America, near Bossburg, is running all of its drills and the concentrator and employing thirty men.——The Bonanza is running a full force and is shipping two cars per day, under Supt. Hanley.——The Big Gold Bug at Bossburg has been sold to Tacoma parties.

Spokesman-Review: Supt. W. H. Brown of the Mountain Lion at Republic is planning to equip that mine with machinery, including a mill.——The tunnel on the Gold Leaf at Republic is to be extended by contract.——W. Lewis has gone to the Mammoth group on Whisky hill, with an additional force of men to put it in the shipping list.——The Palmer mountain tunnel, near Loomis, is in 1800 feet.——At the Golden Zone the concentrator is being built.——Work on the Spokane at Golden will begin in a few days.

FOREIGN.

AUSTRALIA.

Melbourne *Mining Standard*: Until recently the Broken Hill Proprietary had eight 120-ton smelters running, together with three 80-ton smelters. An additional 120-ton smelter has been blown in, and another of an equal capacity will be ready April 5th. As soon as the latter is in blast, it is intended to convert the three 80-ton into three 120-ton smelters.——The mines near Kalgoorlie are getting down into the sulphide zone, but no steps have been taken to treat any of this class of ore.——The problem of water supply for mining purposes is now solved. There is more water running to waste than is being used, and this will be increased when companies now starting at the south end of the field get fairly to work. One company is said to be wasting 150,000 gallons per day, and others up to 20,000 gallons.

London *Mining Journal*: The gold yield of Victoria for the past three months amounted to 184,908 ounces, an increase of 10,154.

BRITISH COLUMBIA.

Fort Steele *Prospector*: The Try Again mine, eight miles from Fort Steele, has been bonded by A. W. Bleasdell to Chas. Estmere, who rebonded to Spokane men for $10,000.

The claim has a 4-foot vein in a tunnel.——The Stemwinder mine in the Tracy Creek district, is reported to have 30 feet of pyrrhotite ore and the wall not reached. Galena also occurs.

Cœur d'Alene *Press*: A strike of copper ore is reported on the Highland King claim, assays going $211 in gold, silver and copper. It is on Diorite creek, twenty-eight miles from Fort Steele.——The shaft on the Mother Lode at Deadwood is down 215 feet; twenty-six men are employed.——The Old Ironsides, at Greenwood, has started its compressor, which runs ten drills, two hoists and three pumps. ——The first payment of $7000 has been made to Genzel, Wood & McDonnell on the bond on the Snowshoe in Greenwood, recently taken by J. W. Astley.——The water jackets for the Hall mines' smelter at Nelson have arrived. The lead furnace will be blown in, and there is enough ore on hand to keep it running six or eight weeks ——Eight men have been put on at the Ajax Fraction in the Slocan.——A new ledge has been struck on the Great Western, at Ymir, at a depth of 25 feet.——A shipment of ore from the Madison, in the Slocan, assays 572 ounces silver and $6 gold.——The upraise in the Evening Star, at Rossland, is in solid ore, which assays $40 to the ton.

Ashcroft *Journal*: S. Baker will work forty men on his West creek hydraulic mines, near the mouth of Cottonwood creek. M. Davis is foreman.

MEXICO.

A Durango dispatch says Warner Miller of New York has a ninety days' option on the Candelaria mine at San Dimas, owned by D. M. Burns of San Francisco. He agrees to pay $1,000,000 for the property.

The Mexican Esperenza G. M. Co., Ltd., of London, Eng., has allowed its bond on the Esperenza mines in the State of Toluca to go by default, after having paid $100,000 forfeit. The price to have been paid was $4,000,000 The company was organized for the particular purpose of buying and operating this property, but after deliberating at a recent meeting it was concluded not to take it up.

San Diego *Union*: President A. H. Butler and Manager M. S. Tweedie of the California & Oriental Steamship Co. have gone to Ensenada, accompanied by W. E. Webb, owner of the Tepustete iron mine at San Isidro, fifty miles south of Ensenada, Lower California. Butler and Tweedie visit the iron mine for the purpose of arriving at some conclusion concerning the probable amount of ore that can be loaded upon vessels within a given time for shipment to Japan by the steamers of the California & Oriental Co. through this port.

SOUTH AFRICA.

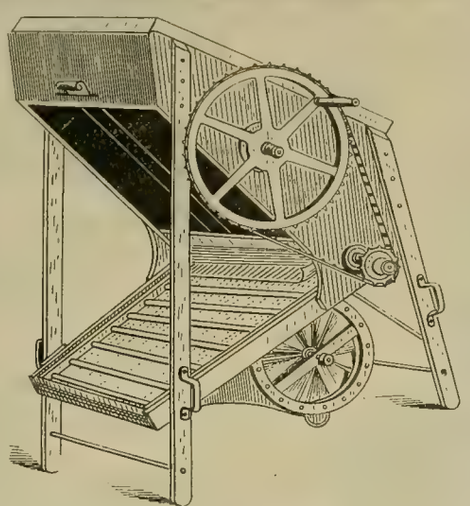
Johannesburg *Mining Journal*: Eighty additional stamps for the Robinson Deep are to arrive in April. The mortar frames are ready to be put in. The addition to the cyanide plant is progressing. One-third of the rock hoisted is sorted out as waste under present conditions.

THE KLONDIKE.

A lucrative business in Dawson is leasing thawing machines to work claims. One L. E Miller has an income therefrom of $250 per day.

The Malt Dry Gold Saver.

The Malt dry gold saver was invented and patented by a man who has followed mining in California since the early '50s. This machine received first premium at the Agricultural Fair in 1897 in Los Angeles over some dozen competitors. All of the materials used in its construction are of the best, well bolted ("not nailed") and screwed together; easily taken apart; woodwork, spruce and poplar; castings, iron and brass; lining, galvanized iron, heavy quality; riffle screen, No. 70 mesh, brass wire; hopper screen, ¾-inch mesh, well secured; fans, galvanized iron, neatly painted and varnished; five riffles on riffle board, also two riffles for nuggets on hopper screen; also flour gold pan underneath pans which saves the finest gold; clamps on sides for carrying about, with handles. Made in three sizes—small, medium and large; also small prospector for prospectors only. This machine can be easily packed and carried. References and full particulars can be had by addressing Wm. H. Hoegee, 138-142 South Main St., Los Angeles, Cal.



WANTED—SITUATION BY A PRACTICAL MILLMAN AND ASSAYER.

Would go anywhere. Best of reference. Address F. B., care of Mining and Scientific Press.

WANTED—POSITION BY MIDDLE-AGED man who can install, run and keep in repair steam, electrical, or mining machinery. Can also do office work and assaying if required.

Address W. H. K., McCloud, Cal.

A Mining Engineer and Metallurgist, at present superintendent of a 50-ton chlorination mill, wants steady position with mine or mill. Desires to change for family reasons. Good references. No objection to foreign countries. Address M. E. M., 1758 Emerson Avenue, Denver, Colo.

Wanted—Large Huntington or Bryan Mill.

Must be in good condition. Also 1000 feet of 12-lb T rails. State full particulars and lowest cash price. Address A. R., Mining and Scientific Press.

WANTED.

Capital to Handle Extensive Gold Mines.

JAMES ARTHUR, Cornucopia, Oregon.

WANTED.

A First-Class Mine Foreman for Development Work in the Northwest.

Must be a good all-round miner in shaft sinking, timbering, tool sharpening, handling men, and strictly sober. Young or middle-aged man preferred. Give experience references, pay wanted and full particulars. Address ROX, care Mining and Scientific Press.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

Gold and Silver Mines to Locate.

A man of experience and integrity will locate for a company a group of promising prospects in Nevada, in an old camp where many prosperous mines have been opened, on fair terms all round. Reference given. Address PROSPECTOR, care Mining and Scientific Press.

Mining Properties,

Prospects and Partially Developed Claims at Low Figures, Near Good Ore Market.

Also a 50-foot ledge, developed. Ore runs $4 and upwards; free milling. Can be quarried. Water right accompanies.

J. N. ROSA, P. O. Box 5, Shasta, Cal.

DIAMOND DRILL FOR SALE,

OR CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE IT.

Apply to J. A. MURRAY, care of Risdon Iron Works, San Francisco.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

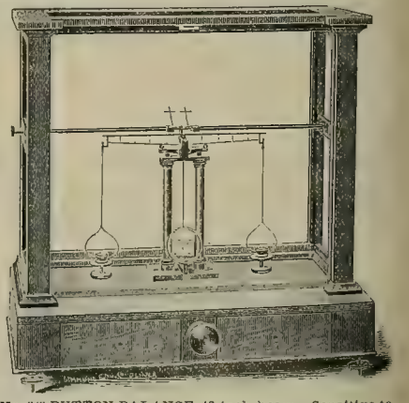
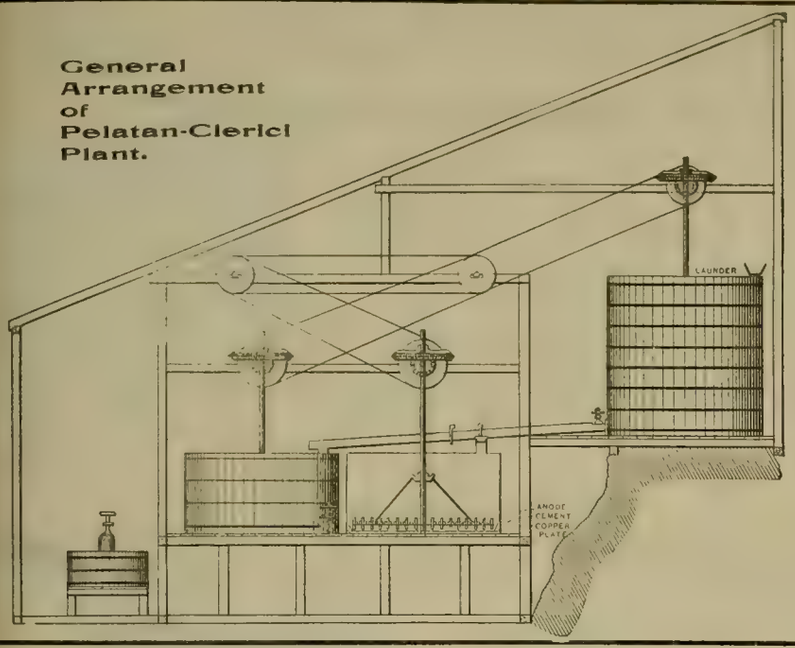
The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to



No 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to
Wm. Ainsworth & Sons,
(Successors to Wm. Ainsworth.) Denver, Colo., U. S. A.

General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves more than 85 per cent by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge.

Simplicity. Economy. Efficiency.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Our 12-in. Duplex Deep Well Pump, 4 ft. 4 in. high, weighs 1000 lbs.

Our Triumph Duplex Deep Well Pump

differs from all others in these particulars: It throws a continuous, unbroken stream without pulsation, vibration, water hammer, air chamber, counter balance, or fly wheel. It has no dead centers or cranks. All work comes on the lift stroke, moving vertically on the center line. We need no anchor bolts with our pumps. Requires less power. Is a perfect pump.

RECEIVED FIRST PREMIUM.

THE MAIT DRY GOLD SAVER

Received first prize at Agricultural Fair 1897 in Los Angeles over some dozen competitors, and has been used in southern California in various mining districts with success. The materials used for the construction are of the best. It is well bolted (not nailed) and screwed together. The woodwork is of spruce and poplar; castings, iron and brass; linings, galvanized iron, heavy quality; riffle screen, No. 70 mesh, brass wire; hopper screen, ¾-inch mesh, well secured; fans, galvanized iron, neatly painted and well varnished. It can be easily taken apart and packed, convenient for shipping to any part of the country. If you are interested investigate by writing us for prices and our illustrated descriptive circulars. Address

WM. H. HOEGEE, 140 S. MAIN ST., LOS ANGELES, CAL.

Market Reports.

SAN FRANCISCO, April 27, 1899.

SILVER.—London, 29d; New York, 63¼; San Francisco, 61; Mexican Dollars, 49½@50. New York exchange, sight, 5; telegraphic, 7½ cents premium.

LEAD.—New York reports steady, $4.30 bid, $4.35 asked; brokers' price, $4.10.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 7c; bar, 7¼c.

COPPER.—New York reports Lake firm at $19.25; brokers' price, $19.21.

A Birmingham, England, dispatch of the 26th says: The enormous rise in the price of copper is playing havoc with the leading industries in the Midlands. At Kynochs batches of hundreds of men have been discharged since the rise in the price of the metal began, and now instead of 4000 men only 2000 are at work there. The Government has decided not to give any more orders for cartridge shells while the present prices prevail, and orders have been issued stopping all the work possible. The electrical fitting firms are also losing business for the same reason. Local, bar, 24½c per lb.

IRON.—American, soft, $22.50@24 50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12½@13c per pound.

TIN.—Pig, 31c per lb.; Bar, 35c. New York reports firmer, $25.30 bid, $25.40 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $42.50; export, $38; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

RED LEAD AND LITHARGE.—One ton and over, at one purchase, 6½c; 500 lbs. and less than one ton, 6½c; less than 500 lbs., 7c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite.	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 32 @ 33c per lb.; carloads, 30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¾c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6¼c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

NAILS.—List per keg: No. 20 to 60d, wire, $3.10; cut, $3.00; 10 to 20d, wire, $3.15; cut, $3.05; 8d, wire, $3.20; cut, $3.10; 6 and 7d, wire, $3.30; cut, $3.20; 4 and 5d, wire, $3.40; cut, $3.30; 3d, wire, $3.55; cut, $3.45; 2d, wire, $3.80; cut, $3.60. In carload lots, 10c per keg less.

CORDAGE.—

Assessment Notices.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1899, an assessment (No. 13) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the fourteenth day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of April, 1899, an assessment (No. 24) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of he corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1899, an assessment (No. 18) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 17th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

MEETING NOTICE.

NOTICE OF ANNUAL MEETING OF STOCKholders of Jamison Mining Company. Principal place of business, 120 Sutter Street, San Francisco. Works on Jamison Creek, near Johnsville, Plumas County, California.

In accordance with the by-laws of said company, the annual meeting of the stockholders of said Jamison Mining Company will be held at the office of the company, Rooms 50 and 54, 120 Sutter Street, San Francisco, California, at 2:30 o'clock P. M. on MONDAY, the 15th day of May, 1899. By order of the Board of Directors.

SAM. W. CHEYNEY, Secretary.

Dated April 14th, 1899.

THE
"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

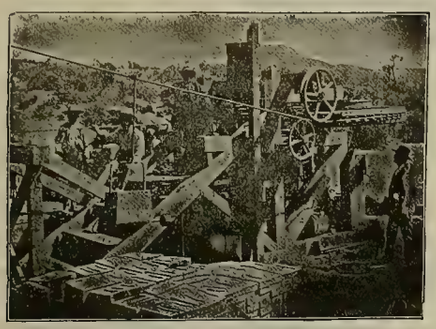
Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

A COMBINED POWER-SHOVEL AND CABLEWAY.

CALIFORNIA WIRE WORKS, - 330 Market St., San Francisco, Cal.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2026.—VOLUME LXXVIII. Number 18. SAN FRANCISCO, SATURDAY, MAY 6, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Genesis of Petroleum and Asphaltum in California.

An interesting series of articles, written by A. S. Cooper, State Mineralogist of California, was concluded in the issue of April 29th, '99. The subject has been exhaustively treated from a scientific and practical standpoint, and conveys a fund of valuable information. The existence of these peculiar mineral deposits has proven a great benefit to the cities of the Pacific coast. The origin of these deposits forms one of the most interesting subjects for study by the student of geology. The accompanying illustration is that of a bituminous rock quarry near Santa Cruz, Cal. The deposits lie almost horizontal, usually, though sometimes gently sloping or rolling, due to slight folding of the formation. Their edges are exposed along the steep hillsides. Usually they are found covered with light-colored shales or clay deposits which must be removed before the bituminous rock can be mined. No underground mining operations are carried on. It is cheaper to remove the overburden than to attempt to support it artificially after the bituminous rock is mined. The bituminous strata vary in thickness in different localities, being usually 10 to 20 feet in depth. In some cases there are two distinct strata of the bituminous rock, the separating stratum being usually sandstone, which is also bituminous, but the percentage is too small to make it commercially valuable. The density of the rock varies greatly, being from 15 to 20 cubic feet per ton.

A peculiar feature of these deposits of bituminized sand is the occurrence of jointing planes, which usually are nearly at right angles to the stratification of the deposit. This is remarkable when the sticky consistency of the material is considered. Vertical deposits of high-grade bitumen also occur which appear as a filling of crevices made subsequent to the deposition of the bitumen, having evidently seeped in.

One of the interesting features of quarrying in these deposits is the unearthing from time to time of the bones of large extinct animals.

Manner of Determining the Quantity of Water and Sediment in Crude Petroleum; A New Battery Stem Guide; Dredging for Gold; The Electro-Zinc Process and Experimental Researches which Led to Its Development; A New Corporation, 484. Metallurgical Standards; A Great Electrical Ventilating Fan; Gold Production of Klondike in 1898; Motors in Mines; The Copper Combine; Report of the New Primrose M. Co.; Conveyed by the Cataract Power Co., 485. Industrial Notes; Personal; Commercial Paragraphs; Books Received, 478. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 493.

SILVER the past two weeks has made a noticeable advance in price. The real reason of this sudden advance is not apparent, unless it is the result of the decided speculative tendency lately developed. It may also be in part sympathetic with copper and iron.

THERE is a growing tendency on the part of the land office department at Washington to enforce more strictly the regulations concerning the location of mining claims. This has taken a definite form in recent instructions issued to United States mineral land surveyors, who are directed as follows: "These provisions of the law (regarding the location of mining claims) must be strictly complied with in each case to entitle the claimant to a survey and patent, and, therefore, should a claimant under a location made subsequent to the passage of the Act of May 10th, '72, who has not complied with said requirements in regard to marking the location upon the ground and recording the same, apply for a survey, you will decline to make it."

SOUTHERN CALIFORNIA has organized a branch of the California State Miners' Association. This was accomplished on Saturday evening, the 29th ult., in the rooms of the Chamber of Commerce in Los Angeles. E. H. Benjamin, secretary of the California Miners' Association; A. H. Ricketts, chairman of the Mineral Lands Committee; Attorney General Tirey L. Ford, chairman on a national Department of Mines and Mining; Senator John F. Davis of Amador, chairman of the Senate Mining Committee, and Charles G. Yale were the representatives present from San Francisco. President Jacob H. Neff was detained by sickness, and Vice-President Ralston telegraphed his proxy to ex-Senator Stephen M. White, with the request that he represent him. The meeting was called to order by Secretary Benjamin and Stephen M. White became chairman. The representatives of the California Miners' Association all pleaded for unity, and were supported by others. A resolution organizing a southern California branch of the California Miners' Association was passed without a dissenting vote. Stephen M. White was made president and Mr. Breese secretary. County organizations will be formed in the seven southern counties, which will unite in the forming of a southern California organization, with headquarters at Los Angeles, but this organization will be part of the California Miners' Association.

Production of Gold and Silver in California in 1898.

The Superintendent of the U. S. Mint in this city has forwarded to the Director of the Mint at Washington a report on the production of the precious metals in this State for the last calendar year. The figures given are the result of a compilation from returns by producers to the San Francisco Mint. The following table shows the approximate yield of counties:

PRODUCT OF CALIFORNIA BY COUNTIES, 1898.

County.	*Gold.*	*Silver.*	*Total.*
Amador	$1,806,363	$1,742	$1,808,105
Butte	514,508	9,317	523,825
Calaveras	1,019,023	3,432	1,022,455
Del Norte	9,057	....	9,057
El Dorado	501,966	4,174	506,140
Fresno	27,557	....	27,557
Humboldt	57,512	....	57,512
Inyo	137,107	73,503	210,610
Kern	1,017,930	6,543	1,024,473
Lassen	37,460	300	37,760
Los Angeles	21,300	...	21,300
Madera	94,884	50	94,934
Mariposa	336,418	993	337,411
Mono	446,017	66,667	512,684
Nevada	2,017,628	19,476	2,037,104
Placer	1,488,022	5,670	1,493,692
Plumas	369,609	....	369,609
Riverside	189,188	1,384	190,572
Sacramento	57,301	....	57,301
San Bernardino	261,512	32,000	293,512
San Diego	673,196	300	673,496
San Luis Obispo	1,000	....	1,000
Santa Barbara	1,000	....	1,000
Shasta	860,180	171,768	1,031,948
Sierra	399,063	519	399,582
Siskiyou	768,804	321	769,125
Stanislaus	19,400	....	19,400
Trinity	859,255	314	959,569
Tulare	12,400	....	12,400
Tuolumne	1,734,953	15,582	1,750,535
Yuba	166,865	....	166,865
	$15,906,478	$414,055	$16,320,533

Comparing these figures with those obtained from the same source in 1897, the gold yield shows a gain of $35,077 and the silver shows a loss of $38,734, making a net loss of $3657, so that the output for the two years is practically the same. The drought the past two years has had a serious effect on the mining industry of California. It is this fact which accounts for the aggregate gold yield of the State remaining about the same during the past two years. In some counties there has been an increase, particularly in the south, and others show a decreased yield; but many new mines have become producers, thus keeping up the average yield. Had not these new producers come to the front, the year's returns would have shown a falling off.

In the year 1898 there were thirty-one counties in the State of California which produced gold, and there was a product of silver also from twenty of these. Of the thirty-one counties, seven produced over $1,000,000 each in the precious metals, and one of these exceeded the $2,000,000 mark. These counties are, in their order of production, Nevada, Amador, Tuolumne, Placer, Shasta, Kern, Calaveras. Both Shasta and Kern counties appear for the first time in the list of counties yielding over $1,000,000 a year in gold and silver. The one showing the largest increase over output of the previous year is Amador county, while Nevada county again leads the list as the largest producer of gold and silver. Twelve counties show an aggregate increased yield of $1,602,723 from previous year, while nineteen counties show an aggregate decrease of $1,606,380, leaving a total decrease of $3657.

The relative importance of the different kinds of gold mining carried on in the counties of California is a matter of interest as to the origin of the metal, whether from alluvial washings or rock in place. Figures collected by the Mint show that not only is quartz mining by far the most important branch of the gold mining industry, but that its importance is steadily on the increase as compared with other forms. Considering both gold and silver, the placer mines of California yielded in 1898 the sum of $1,841,473, the hydraulic mines $962,192, drift mines $1,028,547, and quartz mines $12,488,321. Comparing these returns with corresponding ones of the previous year, it is seen that quartz mining shows a gain of $1,098,191, placer mining a loss of $538,441, hydraulic mining a loss of $388,896, and drift mining a loss of $174,511. The placer, drift and hydraulic mines suffered more, proportionately, from the very dry seasons than did quartz mining. It is found somewhat difficult to separate properly in the returns these forms of gravel mining, as many simply say "placer" in response to the question, when they may actually be engaged in drift or hydraulic mining. For this and the further reason that unless otherwise specified the Chinese are enumerated as "placer miners" (since they never work quartz), some of the gold attributed to "placers" may have come from hydraulic or drift claims. The drift tailings worked by Chinese are also called under the heading "placer."

Inquiry was also made by the Mint officials as to the number of men employed in gold, silver, lead and copper mines of California in 1898. The number is found to be 19,823, and, as compared with the number in 1897, an increase of 3060 is shown. The counties in which over a thousand miners are employed are Amador, Calaveras, El Dorado, Kern, Nevada, Placer, Shasta, Siskiyou, Trinity and Tuolumne. The highest number is employed in Nevada county (1949), which county is also the largest gold producer. The largest producer of silver is Shasta county.

These figures of source of gold and silver are checked by return figures of destination—that is, total receipts of all U. S. mints, U. S. assay offices, refineries, smelting and reduction works all over the United States. The aggregate returns from producers—in source—are larger than those shown by the receipts of mints, assay offices, etc.

Strike and Dip.

A frequent source of error in the location of quartz mines is found in the inability of the prospector to distinguish between the true and apparent strike of a vein. Many veins have a winding course, swinging first one way and then another, but most veins are practically straight for considerable distances. There is less likelihood of error in locating a vein which stands perpendicular, or nearly so, for the topography of the ground does not affect it materially; but where veins have a low angle of dip in a rough country the locator finds his vein striking in a zigzag line across the ridges and gulches and he is often puzzled to know how to locate his claim so as to cover the lode. This difficulty may be solved by a correct understanding of the meaning of strike and dip. The strike of a vein is its direction on a horizontal line, taken at right angles to its dip.

When about to locate a mine the strike must be taken in a horizontal direction (on the level), and not down the slope of the hill. This is the true strike, so do not locate the claim with an elbow in the center, but straight—parallel with the real strike.

A CAUTIOUS investor says mining is a gamble. It must be admitted that this is true in a measure. What business is not? Mining, however, may be conducted in such a manner as to largely remove the speculative element. In the beginning of the history of a mine the prospector stakes a chance when he locates his claim in the hope, if not the belief, that it will contain mineral which it will pay him to develop. As work progresses, and the value of the mine becomes more apparent, whether it be great or small, the risk diminishes. If the prospect is a poor one the possible investor feels less inclined to invest. If it is rich he considers it a fair gamble. With a greater amount of development the prospect becomes a mine with a certain absolute value, and this value increases with the extension of development work until the limit of worth is determined by the actual value of the mine. It may be said that a developed mine showing certain value, whether being operated or not, has a prospective merit, the extent of which it is difficult to determine; but as a matter of course, when the investor is willing to pay for that which he cannot see, he enters the realm of chance and he measures this risk by the indications of a reasonable probability of a continuance of ore deposits only partially developed.

BRITISH COLUMBIA, it appears, has had just enough experience with the American extra-lateral right law to raise some very nice legal problems, which are heightened by the complex geological features of that region.

IT is now thought that copper will at least reach the 20-cent mark, if it does not go beyond it. It seems to be not so much a question of price as to where to look for sufficient metal to supply the still increasing demand.

Concentrates.

EIGHTEEN feet of gravel in bank, one ton.

TWELVE INCHES—1 foot—equal .3058 meter.

TWENTY feet of broken quartz weighs a ton.

LONG belts are more effective than short ones.

ONE Troy pound equals .822857 pound avoirdupois.

TWENTY-SEVEN feet of dry gravel or sand in a pile, one ton.

EACH set of high-speed crushing rolls requires 10 to 50 H. P.

A MINER'S INCH is approximately twelve U. S. gallons per minute.

NEVADA COUNTY, Cal., leads in the gold output for '98 with $2,017,628.

BY doubling the diameter of a pipe its capacity is increased four times.

A U. S. GALLON contains 231 cubic inches; the English gallon 277.274 cubic inches.

IN water pipes the friction increases approximately as the square of the velocity.

ONE pound avoirdupois equals 14 ounces 11 pennyweights 16 grains Troy, or 7000 grains.

MULTIPLY a vertical head of water in feet by .434 and it will give the pressure in pounds.

THIRTEEN cubic feet of solid quartz in place in the mine weighs about one ton—2000 pounds.

A 10x16 JAW CRUSHER requires 15 H. P., more or less, according to the hardness of the ore.

TO REDUCE avoirdupois pounds to Troy ounces multiply the avoirdupois pounds by 14.5816.

IN a quartz mill each 850-pound stamp, dropping ninety-five times a minute, requires 1.33 H. P.

ELBOWS and other irregularities in pipes increase the friction of air or water passing along the pipes.

UNDER 100-foot head 124.6 cubic feet of water per minute will develop 20 H. P. with an impact wheel.

THE amount of water usually required for an ordinary belt concentrator is 200 to 300 gallons per hour.

THE gold ores of California contain on an average about 2% sulphurets, worth from $40 to $200 per ton.

PLIABLE ropes are better for transmission than those that are stiff, as it requires less power to bend them.

THE value of the total mineral production of California in '98, both metallic and non-metallic, was $27,289,079.

THE diamonds mined from South African fields are estimated at 63,000,000 carats, valued at over $400,000,000.

IT is estimated that the present annual output of the United Verde copper mine, in Arizona, exceeds $15,000,000.

THE theory of concentration is based on the difference in specific gravity of the various minerals contained in an ore.

WHERE a rock is soft, the edge of a bit should be sharp, and, as the hardness of the rock increases, the edge should be less acute.

A VOLUME of 386 cubic feet of air traveling 1000 feet through a 3-inch pipe under 60 pounds pressure looses about 3¼ pounds by friction.

ABOUT five gallons of water are required for steam making hourly for each horse power. Each stamp requires 60 to 80 gallons per hour in the battery.

IT is stated that the New Idria quicksilver mine in San Benito county, Cal., can produce quicksilver cheaper than any other mine in the United States.

A GALLON of water (U. S. standard) contains 231 cubic inches and weighs 8⅓ pounds. A cubic foot of water weighs 62½ pounds and contains 7½ gallons.

HEAVILY sulphureted quartz requires fewer cubic feet, but the difference is not particularly noticeable until the amount of sulphurets present is considerable.

PISTON SPEED in engines has been increased from 200 feet per minute to 500 and 600 feet in late years, and now 1000 feet per minute or more is not uncommon.

WHEN estimating requirements when selecting a cable for hoisting in a mine, it is best to allow from one-fifth to one-seventh of the strength, according to speed.

TO ASCERTAIN the speed of drums and pulleys, multiply the diameter of the driver by the number of its revolutions, and divide the product by the diameter of the driver.

THE tunnel on the line of the San Francisco and San Joaquin Valley Railroad near Pinole, in Alameda county, has been completed. It is 1045 feet long and 18 feet square.

IN starting a line of holes for feather and plug work, the line should begin at the face and end at the back, with a deep hole to insure carrying down the side in a true line.

A GOOD preservative of wire rope above ground is raw linseed oil applied with a piece of sheepskin, wool inside, or the oil may be mixed with equal parts of Spanish brown or lampblack.

ONE atmospheric pressure is 14.7 pounds. It will raise a column of water to the height of 33.8 feet at sea level, theoretically, but few pumps produce a vacuum complete enough to do it.

THE resistance of belts to slipping is independent of their breadth, hence there is no advantage in increasing its width beyond what is necessary to enable it to resist the strain it is subject to.

WIRE ROPE must not be coiled and uncoiled, like hemp or other rope. If not on a reel, the coil should be rolled along the ground on its edge, like a wheel; any attempt to uncoil it will cause it to kink.

ELEPHANT BOILERS is a name given to boilers of large size and peculiar construction. They are used when the power required varies greatly, as in electric and cable railroads. They are capable of developing upward of 50% beyond their rating for short periods. Some of the largest boilers of this type have exceeded 50 feet in length.

IN the Leucite hills northwest of Point of Rocks, Wyoming, occurs a leucite rock which is allied to phonolite. The rock has a felsitic texture, though finely porous, and is of light yellowish-gray color.

A HALF-INCH rope running over a 5-foot sheave running 100 revolutions per minute will transmit 20.6 H. P. A ¾-inch rope on a 12-foot sheave running 100 revolutions per minute will transmit 180 H. P.

MOLYBDENITE is the sulphide of molybdenum, and is used in the manufacture of steel, but is not in use on the Pacific coast. The pure concentrated mineral is worth about $200 per ton in Eastern markets.

A STRAIGHT-EDGED drill bit causes most of the cutting work to be done by the outside points. It cuts more rapidly, but the drill must be changed more frequently. A taper or curve is more economical.

AT sea level the atmospheric pressure is nearly 15 pounds per square inch, at 1250 feet altitude about 14 pounds, at 2500 feet 13.33 pounds, at 3750 feet 12.66 pounds, at one mile 12.02 pounds, at two miles 9.88 pounds.

THE greater the diameter of sheaves and drums of winding engines the longer wire rope will last. The wear on a wire rope increases with speed, consequently it is economy to increase the load rather than the speed.

A GALLON of liquid air, weighing about eight pounds, it is estimated, on expanding to normal temperatures, has a total capacity of generating three-fourths of 1 H. P. Of this a good engine might use one-fourth H. P.

IN the year A. D. 1800 the average steam pressure in engines was 5 pounds per square inch; in 1840 it was 20 pounds; about 1850, 50 pounds; 75 pounds a quarter of a century later, and now 120, 150 and 175, and even higher.

IN slotted battery screens a No. 5 screen is 20 mesh; the slot is 29-1000 of an inch wide. A No. 7 screen is 30 mesh and the slot is 24-1000 of an inch wide. No. 9 is 40 mesh and is 20-1000 of an inch wide. No. 12 is 60 mesh, 15-1000 of an inch wide.

A WIRE CABLE running under ground or in water may be protected by applying mineral or vegetable tar, to a barrel of which has been added one bushel of fresh slacked lime; boil it well and apply. The lime will neutralize any acid in the water.

THE average cost of producing the greater bulk of copper in the United States is 7 cents per pound, though at most mines the cost is greater. The lowest cost is said to be at the works of the Boston & Montana Co., where it is 5 cents, the next lowest being Calumet & Hecla.

COMPRESSED AIR under seventy-five pounds pressure per square inch, if allowed to escape from the receiver through a hole, issues into the atmosphere at a velocity of 548 feet per second. If the escape be made through a short length of pipe, the velocity increases to 658 feet per second.

A STRAIGHT-EDGED drill bit does not work to advantage in marble. A straight-edged bit will break on the edges or become dull quickly. The bit should be bluntly pointed and the point should be a little to one side of the center to avoid sticking and to accomplish the best work.

IN feather and plug work in quarrying the depth of the holes must be determined by the cleavage properties of the rock. In all cases they should be deep enough to prevent running off. The plugs are usually alternately short and long, the long holes being on the outside nearest the edge.

THE chief function of air receivers in connection with air compressors is not for the storage of air but to neutralize the pulsations caused by the regular discharge of air from the compressor cylinders and also to collect a large percentage of the moisture incident to the compression of the air.

EVERY 850-pound stamp in a mill dropping ninety-five times a minute requires 1.33 H. P.; each 4-foot belt concentrator requires about ¾ H. P., and an 8x12 rock-breaker requires from 6 to 8 H. P. according to character of ore. Abundant power should always be provided in either hoist or mill.

SINGLE edge bits on drills are always used in hand work, but this type of bit is not suitable for use on percussion drills in hard rock for the reason that the blow is so heavy that the edge cannot be made to stand. For this reason the bit is divided into several edges and the force of the blow is thus distributed.

THE manufacture of zinc spelter, or the process of zinc smelting, is briefly as follows: The ore is first calcined —roasted to drive off the carbonic acid and sulphur and to be transformed into an oxide. It is then crushed fine and mixed with half its weight of fine crushed coke. The mixture is next charged into cylindrical retorts, and there heated to 1300° C. At that temperature the oxide is reduced and vaporizes, passing from the heated retorts into a condenser, where it liquefies, is drawn off and cast into molds.

THE first diamond discovered in South Africa was recognized in March, 1867, by John O'Reilly, near Orange river. The diamond was found on a table in a farm house. It is supposed to have come from the Vaal river. For several years diamond mining was carried on along the river by a system similar to placer mining, but not before 1870 was the real source of the diamonds discovered, when several were found at Dutoitspan, about fourteen miles from the Vaal river. The largest diamond discovered in the river placers weighed 83¾ carats before cutting.

DRILLING in sandstone has a remarkable effect on drill bits. Sandstones are usually soft, but drills cannot be used effectively which are finely pointed. On the contrary, they should be flattened. A bit with a knife-like edge will become shaped like a razor—that is, the edges will become concave. This is due to the bedding of the bit in the grit of the rock, and it is rubbed as though on a grindstone. The sandstone is not usually hard enough to dull or turn the sharp edge, and the more the bit is used the sharper it becomes. It cannot be used long, for the reason that the outside edges, where the most wear takes place, become dulled and the ends become tapered and no longer cut the hole clear. The most successful sandstone bit is that with a blunt, flat edge. It is usually called the stub bit. The bit is usually made 1½ inches long, with a face ⅜-inch to ⅝-inch wide. The cutting face should be square and rectangular. It should be kept thin to secure best results and rapid cutting. If a cornered hole results, it may be overcome by flattening the bit a little. The bit is simply heated and hammered to a square edge. The chief work being done on the outer edges, they must be kept up to gauge.

IN the case of a heavy and unexpected flood of water in a mine, which it becomes necessary to stop by the construction of a bulkhead, a pipe with a valve or gate should be constructed in the bulkhead, affording an outlet for the water while the bulkhead is under course of construction, and which may be closed when the bulkhead is completed. A pressure gauge attached to this pipe will indicate the pressure per square inch. Divide this pressure by .434 and it will give the vertical height of the column or reservoir of water that has been encountered, but this gives no indication of the volume of water.

WHERE A has located and secured a patent upon a placer claim B has no right in a lode or vein which he may subsequently discover on the land of A. There is no law in California imposing a tax on mining locations simply because they are locations. Where claims are on the public domain the title is vested in the United States, the claim holder having only possessory rights. The improvements, however, may be assessed and are taxable, and where the claim is located on an agricultural patent, as many in California are, the improvements are taxable and also the land covered by the claim, the same as any other portion of the ranch.

IN the Moffitt system of ore reduction the ore is first crushed and pulverized by a combined crusher and pulverizer, thence passed into an oxidizing furnace, which has a rotating cylinder with plow-pipe troughs with a high degree of heat under atmospheric pressure, the pressure blower forcing the sulphur, arsenic and other fumes under water, the material passing through a pulverizer, thence over an amalgamating table, thence into the chlorine tanks, then passed through the pressure rubber rolls, the liquid being turned back into the chlorine tanks. This solution is then run into a retort furnace and condensed until all values are in a metallic form.

TO MAKE concrete for machinery or retaining walls, use six parts of broken rock small enough to go through a 3-inch ring, two parts of clean sharp sand, and one part of Portland cement; thoroughly mix when dry. Do not add water until required for use, then add enough water to make a thick mortar; mix in small quantities and use at once; thoroughly tamp with a suitable bar immediately. Concrete made in this manner will set enough in twenty-four hours to carry a load, and in three or four days will be hard enough to run machinery on. If broken rock cannot be obtained, clean creek gravel of about the same size may be used. Never use loam, clay or very fine sand. For special strength use more cement.

A MAP of the workings of a going mine on which the progress of development is indicated, if not daily at least very frequently, is always of great service in giving a more thorough understanding of the relative position of the various shoots or stopes as exposed in the workings, and, in the event of closing down for a long period, an accurate map of the workings has great value should the mine be reopened. The possession of such a map, known to be absolutely correct, would have been worth thousands of dollars to several California mines opened recently after a long idleness. The great danger arising from tapping unexpectedly large bodies of water in old flooded levels in the extension of new work is obviated by the possession of a correct map of the old workings.

THE miner's inch is of California origin and is used very little elsewhere. The term is not a definite one, as various water companies have different methods of measuring the volume of water; for this reason, the miner's inch varies from 1.36 to 1.73 cubic feet per minute. The most common measurement is through an aperture 2 inches in height and of whatever length may be required, and through a plank 1¼ inches thick. The lower edge of the aperture should be 2 inches above the bottom of the box and the plank 5 inches high above the top of the aperture, thus making a 6-inch head, measuring from the upper edge of the plank—with which the surface of the water must be even—to the center of the 2-inch aperture. Each square inch of the aperture represents 1 miner's inch and is equal to 1⅓ cubic feet per minute.

THE Boston & Colorado Smelting Co. was started at Blackhawk, Colo., by N. P. Hill in '67, and, by giving Colorado miners a home cash market for their ores, aided greatly in the development of Colorado's great mining industry. In the building of the little pioneer reverberatory and calcining furnace every firebrick cost $1, being railroaded from St. Louis and then hauled 600 miles in wagons; the iron cost 22 cents per pound, the skilled labor $8 per day, and the smelting charges were proportionate—from $20 to $45 per ton, according to the kind of ore. The resultant matte was hauled 600 miles to the Missouri river, thence railroaded to New York City, thence by vessel to Swansea, Wales, to be separated and refined. Ten years after its establishment it removed to Argo, and at the time of its recent absorption had a record of gold, silver and copper production of over one hundred million dollars.

PHONOLITE and clinkstone are synonymous; the former name is derived from the ringing sound given out when a slab of the rock is struck with a hammer. The essential constituent minerals are sanidine, nepheline and usually hornblende and magnetite. Nosean and hauyne (silicates of alumina and soda) are also often present in considerable quantity, also leucite and tridymite. A number of other minerals also occur, among them augite and olivine. Phonolite graduates over toward trachite when oligoclase appears as a constituent. The oligoclase-sanidine rocks are called trachyphonolites. The amount of silica in phonolites ranges usually from 50% to 60%. As in most other rocks, there are several divisions in the phonolites, based upon the predominance of some particular mineral, as nepheline-phonolite, leucite-nepheline phonolite, nepheline-nosean phonolite, sanidine-nosean phonolite, etc. The proportions vary considerably. Plagioclase rarely occurs in phonolite. Until recently it was presumed that phonolites in America were of rare occurrence, but the association of the rock with rich gold veins in Colorado and South Dakota has led to a search for the rock elsewhere, and there is no doubt it will actually be found more abundant than had been supposed.

Placer Mining and the Future Possibilities of This Branch of the Mining Industry.

Written for the MINING AND SCIENTIFIC PRESS by JOHN W. GRAY.

Placer mining has always been an attractive branch of the industry of mining. It has also been a profitable one. A very large part of the money wealth of the world has been wrested from mother earth by this method, and a large part of that to be gotten in years to come will be obtained in the same manner.

To the moneyed man this branch of mining offers profitable investment for capital, in many cases with less risk and a surer promise of good returns than the same investment in the competitive channels of ordinary industrial enterprises. To the individual it offers, as it always has, the opportunity to engage in mining with far less capital than is usually required in the more laborious and expensive methods of metal mining. To the business man and the public generally it offers a permanent field for disposal of their manufactures, goods and productions, the natural result of the constant production and circulation of the gold obtained. To the State it means increase in population and wealth, and consequent increase in taxable property. The full development of this branch of mining, where the proper field for it exists, means great good to a great many, in a great number of ways, and so it ought to be aided and encouraged by all the parties to be benefited thereby.

From rough crude ways this method of mining has been slowly improved, by successive evolutions of better contrivances and operations, until to-day many of the problems incident thereto have been fairly well solved by the skill of man. The end is not yet attained, however, and the future of this branch of mining will see other improved methods and operations, and its development will be more complete, bringing golden reward in abundance to gladden the heart of the sturdy worker, and a full measure, besides, to those who may aid in this development, or become connected with it in business ways.

Placer mining has passed beyond its primitive stage. Time was, and not so long ago, when the three essentials in its operation were rich gravel, water in abundance and plenty of dump room. The text books extant upon the subject still so declare.

Such is not the case, however. These three attributes are by no means all essential, and it is a matter of fact that successful operations may be satisfactorily carried on without any one of these so called essentials existing. New and improved methods of operation, and the modern machines and contrivances now in use, have opened a new field of possibilities, and already have given practical and profitable proof that a new order of things exists.

California, although she has many skilled miners, and a number of mines operated by the improved methods and machinery, has still a long lane to travel. Other parts of the world are quite abreast of us, and some a distance ahead in the line of travel. In some parts of the world Government and local aid is given and steady effort made to develop this branch of mining. Concessions are allowed, subsidies granted, and the industry is fostered as one of the most beneficial pursuits of man. The great and widespread good coming from a full development of the possibilities of placer mining is understood, and persistent effort is made to attain this end. In this land such is by no means the case, national aid is a thing unknown, the same may be said of the local governments, and in a great measure is this also true of the general public. Progress has to be made against many obstacles, and, in some instances, against constant opposition.

Some little time since I had occasion to become familiar with the conditions of an enterprise on this coast which was being offered in London. The property possessed merit and value, was being offered without overload, and upon perfectly business-like and reasonable conditions. The enterprise was considered promising, but it was decided by the London capitalists that the reports submitted could not be relied upon, since California was the part of the world where such operations were most extensively carried on, and that it was impossible that properties of real merit should be subject to disposal away from there. The very fact that the property was not taken and operated by California people was considered sufficient cause to condemn it. This decision seems surprisingly silly, yet it is not uncommon. The real truth of the matter is that such enterprises in this part of the world are seldom undertaken by local capital, and most of the large operations out here have been developed, and are now being carried on by eastern and foreign capital. Why our mining interests are in a great measure overlooked and neglected by local capital is not so easy to answer, but it is nevertheless so.

And now a word as to the conditions of the industry, some of the lines along which full and permanent development may come, and the possibilities which offer themselves.

Placer mining for the most part is carried on by large companies, with a big capitalization, controlling large areas of ground, and usually controlling also the water supply, great or small, as the case may be. The operations, although by improved methods, are often extravagant and wasteful, and although profitable, are not as much so as they might be made. The best conducted mines have skillful managers and approved appliances. Dredging operations are carried on with a measure of economy and success by the use of improved machines constructed by our well-known manufacturers. Very large areas, however, of the best ground in the State are now unworked, or only partly worked, as a result of the debris law, which prohibits discharge of tailings into the rivers and streams which form the natural dumping ground. There are also many other areas bearing gold in paying quantity which are not only not worked, but not even developed. Restraining barriers to impound the tailings from the large mines now idle have long been talked of. Large sums of money have for several years been appropriated by nation and State for the construction of available dams, etc., but, although the Government engineers have been continuously at work to discover and plan the best thing to be done, no actual work of construction has yet been undertaken, so difficult do the problems appear of solution. Therefore, in a very great measure, the placer mining possibilities of the State await the solution of vexed problems, the assistance of capital and the friendly aid of the public generally to spring strong into life again.

There is a method of mining which may be said to be the reverse of present methods. Instead of wasteful and extravagant use of water, the latter is carefully husbanded, only being used when and where most needed, and then in comparatively small quantity. The foundation principles of this method are economy in the use of water and the substitution, in great measure, of power-driven machines and appliances for hand labor; small tips are used in cutting the ground; boulders and large stones are separated from the fine material; a small quantity of water only is used in washing; the material is run through short sluices of little grade; a number of faces are simultaneously worked; the faces are first cleared and put in the best condition for the economical use of water, and the water is used only so long as complete efficiency is utilized. Again, the faces are prepared, the process repeated, and so continued. The claims made for this method are much greater efficiency in the use of water as an actual getter of gold, and a much greater saving of fine gold, and that it is applicable in connection with mechanical elevating appliances, where requisite dump room cannot be naturally obtained. It is also claimed that the method doing away with long and expensive sluices, costly rock cuts, etc., under proper conditions, can be operated at a moderate cost per cubic yard of material, and, taking into account the greater saving of gold, in final results will compare favorably with other methods of mining. The dredge and other appliances similar in principle are, in a measure, typical of this method in their respective ways, and it has already become well known with what economy it is possible to handle and wash material and elevate the tailings under ordinary conditions.

I have seen this method of mining in operation in a number of places, but have not seen it in practice, in its best form, on this coast. In one place I visited a long terrace was being so worked. From the front the claims extended back indefinitely. The faces were worked in widths of from 100 to 200 feet, three men to each face. Sluices were short and so arranged as to be easily advanced and cleaned. Boulders, large rocks, etc., were dumped behind the work as it advanced, only the fine material being washed. The banks are from 60 to 80 feet high and the water was used under this pressure. Water was used from two hours a day to four hours every other day. The water supply of the terrace was about 400 inches, and it was parceled out and sold to the different faces at the time and in the quantity needed. A very satisfactory quantity of ground was being worked, and the miners, owners of the claims themselves, were making good wages, and paying very liberally for the water besides. Some of these claims had been so operated for a number of years, and had ground remaining more than sufficient to last the lifetime of the owners.

In another place I saw material worked in this fashion, the tailings being elevated by mechanical means over 80 feet, and then washed through second sluices to the dump. The men were paid good wages, and the manager told me that all material going over 10 cents per yard paid a profit. In a large way the cost of handling the material would have been considerably reduced. In another place I saw miners, with free water, easily making wages from ground not averaging over one grain of gold to the yard.

In some portions of the world much work has been done by the Government in the way of supplying water for placer mining. In most cases the mining is done in the manner just outlined. Permanent and prosperous mining communities have thus been created. I have visited some of the mining sections thus developed, and found them busy, active communities, prosperous to a degree, and affording the best markets of the region.

In many places in California, as elsewhere, the development of a water supply and the system of mining I have mentioned would give rise to permanent and really prosperous communities. Operations would be profitable alike to capital and worker. A superior mining class is thus formed, excellent markets created, and local prosperity assured. Gold-bearing fields can be so worked which are of too small average value to pay large companies great profits, but which will nevertheless pay satisfactory incomes for an indefinite time to all industrious workers. The full development of all the fields ought thus to be brought about, thus benefiting all classes in a most desirable manner and profiting to the utmost from this source of wealth. I have in mind, as I write, various localities possessing the necessary natural conditions. Here mining communities could be established which ought to become models of their kind, and substantial sources of constantly created wealth.

Possibly a solution of the vexed mining problems confronting the regions affected by the debris law might be worked out along the lines reviewed. One of the marvels of the present time is the ease, rapidity and cheapness with which material can be loosened, elevated, moved and disposed of in large quantities by the use of power machines and improved modern appliances for such work. The rivers will supply power cheaply and in great abundance, which could be easily distributed to the different localities. The present ditches would supply water for hundreds of separate operations, each one paying satisfactory wages to the workers and a handsome tribute to the capital employed. Probably, in the end, as much money would be made by the land and water owners as under present methods, and incalculably more good would result to the sections interested and the public generally. If this could be done, the debris question might be practically settled, and it is within the range of possibility that, if the money appropriated for restraining barriers, etc., could be expended along the lines suggested, more ultimate good might result from the work than in the direction now being pursued.

A Reverberatory Furnace for Smelting Gold Slimes.*

By W. BETTEL.

Not long ago I noticed a description of a furnace for smelting the ash from the calcination of charcoal, which had been used for the precipitation of gold from liquors obtained in chlorination works.

The similarity of this, in arrangement and construction, to an old style of pan furnace which I had used many years ago in the several smelting establishments, and its adaptability to conditions obtaining on these fields, has induced me to bring the matter before the public.

The furnace is constructed somewhat like a cupellation furnace, only with a rectangular instead of an oval opening to admit the removable brick-lined cast iron pan (furnished with a tap hole and spout, to be lined in the usual way). Two bearers of heavy iron are built into the brickwork, and carry four long screws which support the pan. A simple arrangement is used for regulating the temperature of the furnace, which makes the furnace very economical in fuel consumption.

The method of working here would be as follows: The pan being lined (with brick set in clay) is heated until all the moisture is driven off; the fire is then urged until a good melting temperature is obtained in the furnace, and a charge of fairly clean slag is melted therein. When it is judged that the brickwork in the "pan" is fairly saturated, the excess of slag is tapped out (the basin of the brick lining sloping in all directions to the tap hole) into a large mould (holding about 2 cwts.) having a tap hole near the base to draw off the slag after the particles of gold have subsided. The furnace is now ready for charging with the mixture of calcined slimes and flux, thoroughly moistened with water, either put into paper bags or compressed. The moisture prevents all but a minute loss by dusting (about 0.04% to 0.05%) during melting. When a charge is melted the furnace is again charged with fluxed slimes until the brick-lined pan is full of molten slag. It is now rabbled with an iron paddle to thoroughly mix the slag and collect the particles of gold. These, being fairly pure, have a high melting point, and they sink unmelted, but as coherent masses, to the floor of the furnace. About twenty minutes' firing cleans the slag sufficiently. It is then tapped out, the gold being left unmelted. When all the slag has drained out the heat is rapidly raised (a smoky fire being avoided), and the oxidizing flame quickly melts and refines the gold. The molten gold is then, with due precautions, tapped out into moulds. If, however, a large quantity of slimes has to be melted, the slag is tapped from time to time, leaving the gold unmelted in the furnace until after the last tapping out of the slag, when the gold is then smelted down, refined and tapped. The bullion is remelted in the

*Journal of the Chem. and Met. Society, South Africa.

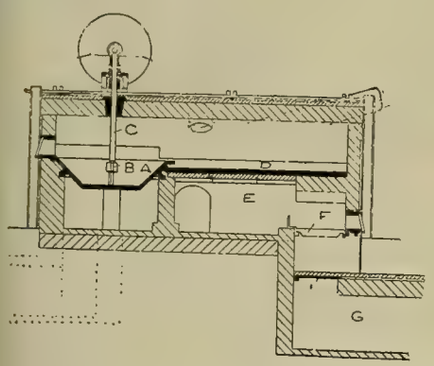
usual manner for casting into bars. When convenient the lining is taken out of the pan, the dark colored brick separated from unstained firebrick, the former crushed in a small mill, and the gold recovered by cradling, panning, or amalgamation in the usual way, the residue, if rich, being resmelted with rich slag. If poor, it is to be mixed with the bulk of the slag for sale.

The small amount of gold collected in the flue (and dust chamber, which is not an expensive addition) after say six months' smelting, is smelted with the next batch of slimes.

This simplifies slimes smelting. It is less expensive than ordinary smelting with plumbago pots. The bullion is obtained of any fineness up to 995, and with ordinary precautions customary in handling gold-bearing materials, can be relied upon to prevent losses at present unavoidable. The refractory material (firebricks) is easibly obtainable, and the cost per ounce of gold for renewal extremely small. After smelting, the pan may be removed from the furnace, if thought advisable, and placed under lock and key until the following smelting, thus avoiding all risk of theft of the small amount of gold it may contain.

The Manufacture of Sulphate of Copper.

What is claimed to be an entirely novel process for the manufacture of sulphate of copper has recently been devised by a chemist at Bordeaux. It is well known, says *Industries and Iron*, that when commercial sulphuric acid at 66° Baume in which copper is immersed is heated, the acid is partially decomposed; the copper is transformed first into a sulphide, then into an oxide, sulphurous acid and steam being liberated. The undecomposed sulphuric acid unites with the oxide of copper and transforms it into sulphate. By continuing the heating operation, the excess of sulphuric acid, if any, volatilizes; anhydrous sulphate mixed with a small quantity of sulphide of copper remains. On again treating the mass with hot water the sulphate dissolves; the liquor is decanted, and crystallizes on cooling. The copper still unattacked, if such exists, is collected and again enters the cycle of operations; the same applies to the sulphide.



FURNACE AND PAN USED IN MAKING COPPER SULPHATE.

The copper is introduced either in the state of fragments, granulated, precipitated or the like into a cast metal vertical shaft shown at *C*, to which a movement of rotation is imparted from the outside. It carries two horizontal arms, marked *B*, provided with toothed ribs in the form of plow shares capable of sliding vertically along the driving shaft in such a manner as to constantly clean the bottom of the pan and prevent the adhesion of material, whatever their degree of wear may be. This pan is heated. When almost the whole of the copper has combined with the acid the contents of the pan are transferred by the operatives to a sole plate *D*, which is also heated, and where the reaction is completed. When this has taken place the mass is caused to fall into a vault or cellar, shown at *E*, of dimensions varying with the magnitude of the operations. Cooling takes place in this cellar, and the mass is then removed by the operatives to the dissolution vessel. There are always two operations in progress in the furnace, one in the pan and the other upon the sole plate. The sole plate and the pan are heated by the grate marked *F*; but should there exist at hand a sufficient source of waste heat, the bars of the grate may be removed when once the furnace has been started, and the door of the grate and the ash-pit may be walled up. A damper is shown at the covering of the stone marked *G*.

It is stated that the deepest ocean sounding yet recorded has been made by H. M. S. Penguin during a cruise in the Pacific. A depth of 4762 fathoms was found between Auckland and the Tongan archipelago. The Penguin also investigated the recent disappearance of Falcon island, which was formed during a volcanic eruption in 1885 and vanished in September last year, and it was found that the island had sunk three fathoms below the surface.

The Crosshead in Shafts.

To the Editor:—Noticing an article on crossheads in your issue of April 1st, '99, I desire to bring your attention to two improvements in same (according to my idea). In the first place, 24 inches is too small, as the crosshead is apt to pitch and get stuck in the guides, thereby running risk of pulling

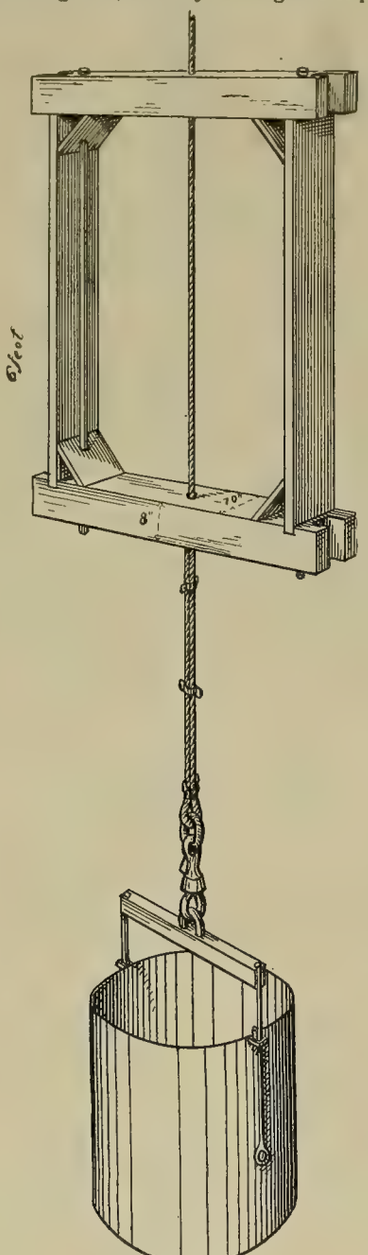


FIG. 1.

guides out. The law or custom in Montana is to make them about 7 feet long, as they run more smoothly and are not dangerous. The upper and lower deck are made of wood, as in sinking vertical shafts the less you have above you to become loosened the better. Iron straps are liable to come off and are subjected to a severe strain when you dump the bucket on top. As the crosshead goes down it rests on the chuck blocks placed near the bottom of the shaft and stops there. The bucket descends to the bottom. Miners riding the bucket guide it with their candlesticks by touching walls until it reaches the crosshead, which can be kept any distance from the bucket desired. The cable can be turned back the desired amount and secured

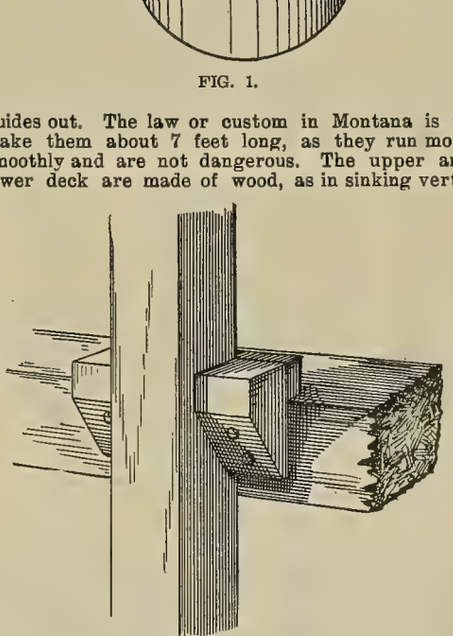

FIG. 2.

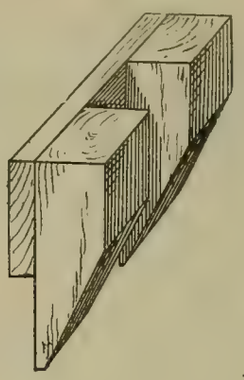
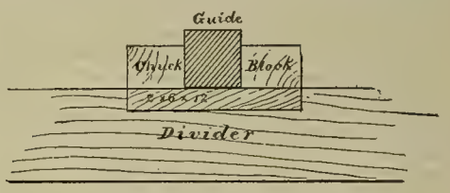


THE CHUCK BLOCK.

by clips. Engineers must lower the bucket slowly when approaching the chuck block, so as not to let the crosshead fall upon them, as they may be knocked loose. When possible it is best to sink 35 or 40 feet below timbers and then put in a number of sets at a time and bring them down as far as you can with safety. My idea is that the vertical height of the crosshead should be one and one-half times its width. In using a wood deck with side of jaws



PLAN OF CHUCK BLOCK.

made of wood (cut from one piece) there is no danger of picking out splinters in guides.

The accompanying drawings will illustrate the construction of the crosshead, and of the chuck blocks and their position in the shaft. The chuck block is so arranged that the wedge-shaped blocks have a position on each side of the guides—are joined by a piece 2x6, which rests upon end plate or divider. For security the wedge ends should be nailed to the timber. The chuck blocks should be placed on each side of the shaft. Fig. 1 shows the general arrangement of the crosshead. Fig. 2 shows the chuck blocks in position. CROSSHEAD.

Auburn, Cal., May 1st, '99.

Government Assistance in Australia.

A change has been made in South Australian mining conditions by the repeal of a regulation having respect to State assistance in prospecting, and the substitution of a different provision. The Minister will receive applications for Government assistance from any person or company engaged in deep-sinking, and may grant such applicants subsidies as he may think proper, but no subsidy shall exceed 100% on the amount proposed to be expended, and the total grant to any person or company shall not exceed $5000. The amount of the subsidy shall be a debt due to the Crown, and 50% of the net profits of the mine shall, until the subsidy is repaid, be applied in payment of the subsidy. The person or company, before the subsidy is paid, shall execute a bill of sale to the Minister, to secure payment of all chattels belonging to the person or company used in connection with the mine, or which shall thereafter be acquired in connection with the mine. In the event of the insolvency of any person, or the winding up of any company to whom a subsidy has been granted, the Minister shall have a first charge on all assets of such person or company in respect to such portion of the subsidy as shall be unpaid.

The California Water and Forest Society, lately organized to deal with the vast problem of the State's water resources and their conservation, has gone ahead in the direction of carrying out the laws which failed to receive the Governor's signature, as if they had been approved, and has appointed the officers contemplated. The Commissioner of Irrigation is Professor George Davidson and the Forestry Commission is composed of Professor E. W. Hilgard of the University of California, Professor Dudley of Stanford University, Abbot Kinney of Los Angeles, Warren Olney, Sr., of San Francisco and George Towle of Placer county. The officers named are simply officers of a voluntary society, but it is the idea that they shall in a large measure fulfill the functions of such State officers.

Some Experiences of a Working Miner.

NUMBER XII.

Written for the MINING AND SCIENTIFIC PRESS.

Mining probably affords better opportunity for gross misstatement and exaggeration of facts, with a fair chance of finding a believer, than any other business. The prospector is proverbially optimistic—he must be to succeed—and he assiduously endeavors to impress all others with his ultra-sanguine views of things, particularly the value of his own property. There are a few—a very few—exceptions to this general rule. I once met a prospector named McN——, who owned about a hundred locations, and he wanted me to go up and make an examination of one of them, several miles distant. He explained in some detail the existing conditions at his prospect, stating that at the surface he had a vein 12 inches wide which assayed $100 per ton, but at the bottom of the shaft, 12 feet in depth, the vein did not look well—in fact, he was not sure he had a vein there at all. Thinking it might be a case of fault, I and a friend went over to look at the place, and, true enough, there were pieces of ore about a foot wide which evidently had been taken from a vein near the surface, but which in sinking had pinched to a seam, and in the bottom of the shaft was absolutely nothing. My friend gazed down into the hole and remarked, "This fellow, at least, is discouragingly truthful." This was a rare instance.

When at the P—— M—— mines, at the invitation of the owner of a claim some seven miles distant I went with him to look at the prospect. He assured me he had 3 feet of ore which would mill $18 per ton. I doubted it, but, as in many previous cases and since, went anyhow, against my own judgment. We walked across the sands of the desert, heated under the scorching rays of a May sun, and eventually arrived at the place, where I found a cut 20 feet long and 4 feet wide. No quartz was visible anywhere, but there was a quantity of light gray dyke rock piled up on the dump, and lying in the cut was a boulder of the same material weighing perhaps 500 pounds. To say that I was disgusted is a very mild way of putting it. I asked what had become of the ore, and the prospective millionaire pointed to the pile of dyke rock. I remarked in somewhat forcible language that I doubted his statement and knocked off a piece of the light gray rock, which on close inspection was found to be spangled with fine points of gold. This simply illustrates that it is not always safe to doubt even the prospector, for in this case also he was truthful.

I have in mind another instance in which the usual relation of the claim owner to the intending investor is clearly shown. Two men owned the G—— mine and had done considerable work upon it, in the course of which some very rich gold ore was encountered, with the usual resulting notoriety. The widespread fame of the property came to the notice of two capitalists of O——, who went to examine the mine. They spent some time on the dump and in the large open cut, grinding and panning ore, always with surprisingly rich results. On being invited to go down into the shaft, one of the capitalists looked timidly down into the dark hole, and, discovering only two or three sticks of timber and a very frail ladder (he was a large man), declined the invitation, but asked how it looked below.

"Just the same as it does up here," was the unhesitating reply, which, by the way, was the truth, too; but he might have added, with equal truth, that there was little or no gold down there, though it looked the same.

"How much do you want for this property?" was the abrupt question of the would-be investor.

"Well," was the cautious answer, "I don't know; you see, we have never put a price on it."

"It is for sale, isn't it?" asked the rich man.

"Yes, I guess so," was the reply; "we will sell anything we have."

"Well, name your price," was the business-like remark of the capitalist.

In relating this circumstance afterward, one of the owners of the mine admitted to me he did not know what to say. He feared if he put it too low they might become suspicious, and, if too high, they would not buy. He explained to me:

"You see, we knew the mine better than anybody. There was nothing in the level at the foot of the shaft, and, although the face of the cut looked beautiful and showed lots of free gold, we knew there was nothing back of it, for we had drilled holes through and tested the drillings. Finally, I made a venture and said: 'Well, Mr. H——, we will take $50,000 for the mine.' To which Mr. H—— replied, without the least hesitation: 'All right; we will take it.' I nearly fell in the shaft. You could have knocked me down with a feather."

Now, you will naturally conclude that this deal was a go; but it was not. It almost passes belief that these two poor miners, having a chance to get a fortune for a prospect which they believed to be practically worthless, should let such an opportunity pass. But this is the way of the prospector. His cupidity—and, in this case, dishonesty as well—often results in his undoing.

The same day a third party, learning what had been done, talked and urged and plead with these two men to consolidate their property with one in the neighborhood on which he claimed to have a bond, representing that he could dispose of the whole property for half a million dollars, of which their share would be $200,000. They eventually consented, and when, a few days later, the capitalists returned with the coin to pay for the mine, they were informed that it would be impossible to close the deal, as they had made other and more satisfactory arrangements. The two capitalists were greatly disappointed and very angry. All this occurred several years ago, and the prospectors still have their mine, nothing ever having been done with it since, and it can now be had for a song. It may have been relocated by others, for all I know.

Some years ago when the E—— G—— mine was in full blast and making money, the superintendent concluded that the brick stacks should be replaced with water jackets, believing it would prove a financial benefit to his company. After much correspondence and telegraphing back and forth the directors finally held a meeting, at which the superintendent was present and explained his ideas fully. The directors were satisfied of the advisability of the suggested change, though it would involve the expense of a large amount of money. They finally, somewhat reluctantly, told the superintendent to go ahead and make the change. He returned to the mine, several hundred miles distant, after having ordered the furnaces. Almost immediately upon his arrival at the mine he commenced blowing out the furnaces and as rapidly as possible to tear the old brick stacks down. Within ten days he wrote the head office detailing progress in demolishing the old plant. The effect of this letter was almost electrical. Another meeting of the board of directors was held, at which it was determined that such unwarranted, precipitate action on the part of the superintendent was unheard of—how did he know but that they might want to reconsider the matter, change their mind, and countermand the order for the new furnaces. The promptitude of the superintendent almost cost him his place. However, he finally got them down to a business basis again and the work proceeded without further interruption. A large portion of the timber and lumber of the old plant was used in constructing the new. When the new furnaces were in readiness, one after another was blown in, and the first charges consisted of the bricks and refuse obtained from and about the old furnaces. The men found upon digging beneath the site of the old brick stacks that the metal had penetrated some distance into the earth. All this was cleaned up and charged into the new furnaces. The result was a large quantity of high-grade bullion—far higher than had ever been shipped from the mine at any previous time. The effect of this surprising output in the home office may be imagined, and it was all laid to the superiority of the new water jackets and the good judgment of the superintendent. When the waste and refuse of the old plant were exhausted, ore from the mine was again charged as formerly and the grade of bullion dropped from about $400 to $150 per ton. When the first consignment of the latter grade reached the home office the superintendent received a telegram reading "Make no bullion under $400 per ton." In reply to the mandatory telegram the superintendent was obliged to write a long letter explaining that the directors would have to furnish a correspondingly higher grade of ore to reach the $400 bullion mark. Incidentally I will add that the debris of the old plant which was run through the new paid all the cost of the change, and the ore was treated to a greater advantage at lower cost. MINER.

THE value of a pan prospect can only be determined when every factor in the case is known. One frequently hears an expression of satisfaction or pleasant surprise at the sight of gold in a pan prospect, with a remark as to its richness or poverty, when the observer knew nothing whatever of the quantity of ore or gravel from which the prospect resulted. It may have been an ounce, it might have been a pound or more. The value can only be determined when the relation of the quantity of material taken to the result in gold is known. Even when the quantity of ore or gravel is known, it is not always safe to venture a guess as to the value per ton unless one has become familiar with the material by frequent tests verified by assays, or treatment in mill or sluice. Many prospectors hazard a calculation as to the value of the ore by counting the number of colors, each color representing an arbitrary value per ton, as one color $1.50 per ton, twelve colors $18, etc. How unsafe this is may be readily understood when consideration is given to the fact that the colors, being very small, usually, give no indication of their shape. Light, scaly gold, while making a good showing, will not weigh up with round, shot-like gold, apparently much inferior in size. When one becomes accustomed to the gold in any particular mine, he may then make a fair approximation of the value of his ore by pan prospect; but if he remove to a new locality, all this has to be learned again by experiment.

Cinnabar in San Luis Obispo County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by F. VON LEICHT, E. M.

Deposits of cinnabar in the rocks of the Santa Lucia range of mountains have been known to exist in San Luis Obispo county as early as 1862, when Mexicans opened the first mine, and since then many other cinnabar prospects have been found and over 150 claims located.

Among these, the Oceanic mine is the most important in production of quicksilver as well as in the extent of its ore deposit. The mine was worked during the years from 1876 until 1879, when the price of quicksilver went down to $25.25, a price which forced most of the quicksilver mines in this State to shut down, the Oceanic mine being among this number.

The Oceanic mine is located in the hills north of Santa Rosa creek, five miles east of Cambria, along a large fissure which follows near the contact of sandstone and serpentine. The trend of this fissure is nearly east and west and the outcroppings of the harder portions of the vein can be plainly seen, reaching to the west towards the ocean and extending to the east into the higher parts of the mountain range. The ore is mainly composed of material derived from attrition of the two rock formations, and this material has been recemented, more or less, and is of different grades of fineness and cohesiveness, being classified as sandstone, loose sand and mud rock. All these grades of vein material are impregnated with cinnabar and sometimes with small globules of native quicksilver. The average ore contains nearly three-fourths of one per cent in cinnabar distributed through the mass of vein material in small grains, in small seams and sometimes in small masses.

The fissure which contains the sandstone ore body has a length of 250 feet and a varying width from 6 to 22 feet, while the fissure filled with the so-called mud rock is about 50 feet in width and probably of the same length as the sandstone ore shoot, the two ore bodies being separated by a barren sandstone formation about 20 feet in width. The sandstone vein has been penetrated to the depth of 600 feet and is shown to contain the same character of ore to that depth, while the mud rock deposit has been only opened to 150 feet in depth, showing the same width of deposit there and indicating that it will reach to greater depth. There is a large quantity of ore in sight, all of similar grade and value. The country around the mine is delightful, and Cambria is a thriving little town of about 350 inhabitants, where nearly all supplies needed at the mine can be purchased at very moderate prices.

A NEW EXPLOSIVE is being experimented on at Sydney, Australia. It is called kallenite, and differs from dynamite in that, instead of being largely composed of an incombustible base-like infusorial earth, eucalyptus leaves and ti-tree bark are used. These contain a large quantity of gas, and their combustion adds to the force of the explosion. The whole compound, in short, is explosive, and this, it is claimed, adds to its efficiency and economy at the same time. In the experiments at Sydney four holes were drilled to a depth of 16 feet, and each was charged with twelve pounds of kallenite. The charge was fired by electricity, and dislodged with comparatively little upheaval 200 cubic yards of stone. There was little noise and hardly any perceptible smoke or fumes. These qualities would indicate kallenite to be a desirable explosive for military as well as for mining purposes.—Johannesburg, S. A., Mining Journal.

CONCERNING silver, former Director of the Mint E. O. Leech is credited with saying: "It is my suspicion that some one in London may profess to have advance information in regard to the recommendations to be made by the Indian currency commission, which has been taking testimony for several months and is expected to make a report next fall. If it is contemplated to reopen the mints of India to the coinage of silver upon any terms, in order to supply the need there for more currency, the demand thus created would tend to advance the price of the metal more than any other influence. The belief that such a step might be taken, whether well founded or not, has influenced the silver market on several occasions since the Indian mints were closed in 1893."

THE Ute reservation in Colorado was thrown open to occupation at noon on May 4th by proclamation of President McKinley. The strip is fifteen miles wide by sixty in length and embraces valley and mesa lands. Only a limited amount of prospecting has been done on the reservation, but it is believed to be underlaid by coal and oil.

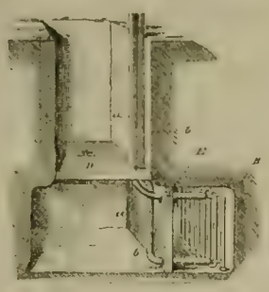
THE powder works at Point Pinole, in Alameda county, Cal., exploded on the morning of the 4th inst., without killing any of the workmen, fortunately, though there were several who had narrow escapes. This is the second time within a year these works have been destroyed.

Latest Mining and Metallurgical Patents.

Patents Issued April 25, 1899.

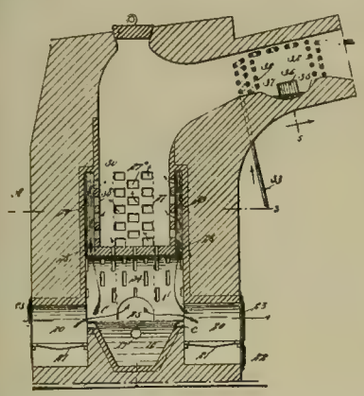
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR FACILITATING EXCAVATING OR MINING.—No. 623,598; H. Francis, Madison, N. J.,



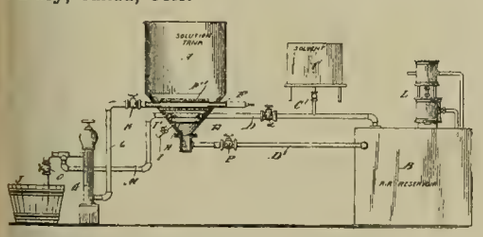
An apparatus for facilitating mining operations in frozen soil, the combination of the descending and return pipes *a b* having horizontal lateral bends, an upright or perpendicularly presented movable coil *B* forming extremity or connection between pipes, the upright movable shield *E* for confining the heat and protecting operatives, and movable non-conductive diaphragm or shield *D* for preventing displacement of the warm air by cold air.

SMELTING FURNACE. — No. 623,762; C. Bishop, Knoxville, Cal.



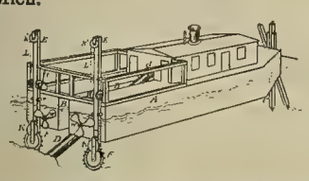
Smelting furnace, provided with fireboxes, an ore supporting arch between the fireboxes into which the said fireboxes open, and side flues having lower ends leading through the arch provided with perforations in their inner walls, an exit flue provided with a settling box, a condenser in the said flue, fireboxes opening into the central chamber, a settling pot in the bottom of the central chamber and provided with a slag and a bullion off-take, a bullion pot into which the bullion off-take leads, an apertured arch above the settling pot, and apertured flues, two of which lead through the sides of the arch at the bottom and the other two through the top at the ends.

APPARATUS FOR LEACHING ORES.—No. 623,772; A. F. Duey, Salida, Colo.



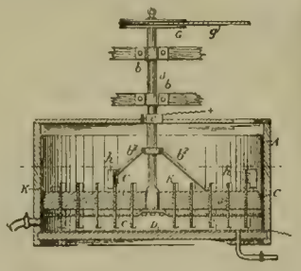
Leaching apparatus, comprising leaching tank or vat, means for forcing air through the ore with the leaching liquid, a hollow filter in the tank above the inlet for the air and leaching liquid, a pipe leading from the filter, a pump connected with the pipe leading from the filter, an air compressor, a tank for storing leaching liquid, perforated pipe in the bottom of the leaching tank, connections from the air compressor and liquid storing tank to the perforated pipe, perforated drainage pipe in the bottom of the tank, and layer of filtering material about said pipe.

HYDRAULIC DREDGE.—No. 623,804; B. H. Muehle, Detroit, Mich.



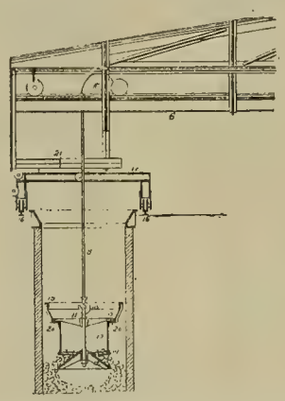
Dredge hull provided with an upright spud at or near one end, and a traction wheel carried by said spud, traction wheel constructed and arranged to travel on the river or analogous bottom transversely of said hull, whereby the end of the dredge hull to which the traction wheel in engaged may be moved laterally. A vertically adjustable suction tube *D*, and moving around a pivotal spud *C* by means of one or more traction wheels *F* upon spuds *E*.

APPARATUS FOR TREATING ORES.—No. 623,822; Luis Pelatan, Paris, France.



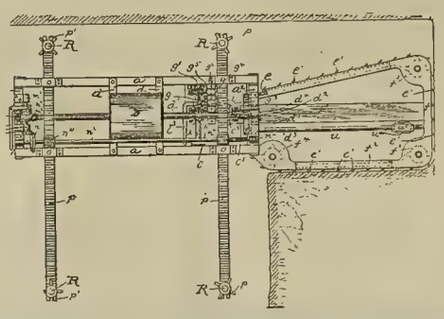
Apparatus of the kind described, combination with a vat, of a mercury cathode at the bottom thereof, an anode suspended in the vat entirely from above whereby an unobstructed space is provided between the surfaces of the anode and cathode, said anode consisting of an arm extending close to the sides of the vat, and pins or stirrers projecting from said arms upwardly and downwardly to within a short distance of, but none of them touching, the cathode. The combination with an annular vat, of an annular mercury cathode at the bottom thereof, a rotatable annular cathode above and parallel to the cathode, the anode consisting of arms extending close to the inner and outer internal walls of the annular vat and provided with pins or stirrers projecting from arms upwardly and downwardly to within short distance of, but none of them touching, the cathode.

BLAST FURNACE CHARGING APPARATUS.—No. 623,854; S. T. Wellman, J. W. Seaver, and C. H. Wellman, Cleveland, Ohio.



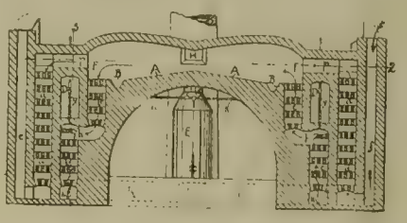
An apparatus for feeding or charging a furnace, comprising a main crane having a portion extending over the furnace, a bucket suspended from said crane and having a movable bottom connected to the suspension device, a raising and lowering device on the crane for said bucket, a flange on the bucket and a ring adapted to engage flange and support the bucket, a supplementary crane having raising and lowering mechanism for ring, a structure depending from the main crane and adapted to support the bucket when the support of the suspension device is removed.

MINING MACHINE.—No. 623,924; J. M. McHugh, Boston, Pa.



Mining machine, the combination of a suitable frame, cutting mechanism on frame, means for advancing cutting mechanism longitudinally into the coal and for moving frame transversely of the cut, a rocking bar on frame, a cutter guide on bar adapted to form a longitudinal groove in the coal, and means for locking bar in position, the combination of a main frame having channel bars extending longitudinally thereof, the open faces of channel bars facing each other, downwardly projecting flanges on bars, pins passing through bars and flanges forming racks thereon, a movable frame, cutting mechanism carried by frame, a shaft on frame, pinious on shaft engaging racks, and mechanism for rotating shaft.

ROASTING AND SMELTING FURNACE.—No. 623,833; J. A. Russell, Tacoma, Wash.



A roasting and smelting furnace having a hearth sloping and widening from a central summit, superheating and gas generating chambers at each end of said hearth, generating chambers each divided by an offset into two parts, an opening from side to side of the furnace above the lower part of each of said generating chambers and means in openings for alternately discharging liquid hydrocarbons into said lower generating chambers.

Fireproof Mortar.

Many mixtures have been tried by builders and architects with a view of producing mortars which will really possess fire-resisting properties, and nothing satisfactory up to the present has been discovered; but now some one has discovered that serpentine rock, which contains a considerable amount of asbestos, possesses very high fire-resisting properties. This rock, when powdered and mixed with good lime, etc., can be heated up to 1100° F. without experiencing any damage whatever.

One of the great dangers when a building is on fire is that the mortar after being heated cracks or disintegrates when water from the firemen's hose is thrown upon it. The new material, however, it is claimed, can be heated to 1100° F. and immediately plunged into water without cracking. Another great advantage possessed by this new material is its high degree of elasticity. The advantage of this will be readily appreciated by architects and others who are constantly called upon to advise with regard to sinking or settling buildings. As soon as the building begins to settle, ordinary mortar begins to crack, but this new mortar is so elastic that it does not crack, but simply yields to the strain. But perhaps one of the most remarkable properties of all is the ease with which nails can be hammered into joints made with the new mortar without damaging it in the slightest degree. It flows readily from the trowel and can be easily pointed up.—Iron and Steel.

Serpentine is very abundant in California, but it does not usually contain asbestos in any considerable amount. Small veins of crysotile in serpentine masses are not of infrequent occurrence, and occasionally a locality is found where asbestos occurs in considerable abundance, which, though unsuited to the ordinary uses to which that mineral is put, may be sufficiently good for the purpose of making fireproof mortars, as described above.

The Copper Combine.

The much talked of copper combine has at last taken tangible shape. The Boston *Financial Review* says:

The charter of the Amalgamated Copper Co. (present issue of capital $75,000,000, with power of unlimited increase) has been filed at Trenton, N. J. In New York City the Amalgamated Copper Co. organized for business with the following officers and directors: President, Marcus Daly; vice-president, Henry H. Rogers; secretary and treasurer, Wm. G. Rockefeller. Executive Committee—President ex-officio, Wm. Rockefeller, Henry H. Rogers, A. C. Burrage. Directors—Marcus Daly, Wm. Rockefeller, Henry H. Rogers, A. C. Burrage, Robert Bacon of J. P. Morgan & Co., R. P. Flower of Flower & Co., F. D. Olcott, Pres. Central Trust Co. of New York, James Stillman, Pres. National City Bank.

Seventy-five million dollars of the capital stock is offered for public subscription at $100 per share by the National City Bank of New York.

Golden Gate Mill, Mercur, Utah.

In a recent issue appeared two illustrations of the Golden Gate mill, Mercur, Utah, the largest cyanide mill of the kind, and on page 477 is presented what is in some respects a better outside view of the mill, which has attracted considerable attention. The ore is broken to 2-inch ring by No. 6 Gates crushers, and subsequently reduced to suitable cyaniding sizes in nine sets of Gates rolls, operated in series.

Manner of Determining the Quantity of Water and Sediment in Crude Petroleum.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

The presence of water in crude petroleum oil can be detected by flooding a pane of glass with the crude oil, so that a thin film of the oil is left upon the glass, and then holding the glass before strong daylight; if water is present, it will show as bright round spots in the darker ground of the film of oil. To make sure that these brighter spots are not air bubbles, they can be pricked with the point of a needle.

In Allen's "Commercial Organic Analysis" the following occurs: "The water and sediment present in crude petroleum of Pennsylvania are usually determined by mixing the sample with an equal quantity of petroleum spirit and keeping the mixture at 49° C. (= 120° F.) in a graduated glass vessel for at least six hours, after which the liquid is allowed to cool and settle for a period of not less than two hours for light-grade oils, increasing to eighteen hours for the heaviest qualities."

This test is good for such oils as have a paraffin base, such as the Eastern oils, as paraffin is soluble in petroleum spirits; but where the base of the oil is asphaltum, as at Summerland, the asphaltene, one of the constituents of asphaltum, being insoluble in petroleum spirits, remains undissolved. The undissolved asphaltene sinks slowly down through the solution and floats upon the surface of any water that has already separated from and reached the bottom of the tube. This stratum of asphaltene arrests the further settlement of any asphaltene sediment and water which were gradually sinking towards the bottom of the tube. The water, asphaltene and sediment form a mechanical mixture which is called "sludge."

California oils sometimes contain water to the extent of 15%, and if very heavy a considerable amount of silt. The following table gives the specific gravity of some petroleum oil and solvents for the same:

	Specific Gravity.
Petroleum spirits, a solvent of Eastern petroleum oil and paraffin, but is not a solvent of asphaltene	.725
Solvents of Eastern and California petroleum oil, paraffin and asphaltene:	
Turpentine	.870
Chloroform	1.527
Carbon disulphide	1.292
Eastern oil paraffin base	.823
Summerland oil asphaltum base	.957

Crude Eastern oil having a specific gravity of .823 is considered so dense that water and sediment will not settle from it without decreasing its density by the addition of petroleum spirits. One part of Eastern petroleum and one part of petroleum spirits give a solution having a specific gravity of .774 as follows:

	Specific Gravity.
One part petroleum spirits	.725
One part Eastern oil	.823
	1.548

and 1.548 divided by 2 equals .774, the specific gravity of the solution.

Even if petroleum spirits was a solvent of asphaltene, how absurd it is to attempt to determine the quantity of water in the Summerland oil which has a specific gravity of .957 by adding an equal amount of spirits of petroleum having a specific gravity of .725, which forms a solution having a specific gravity of .841, being a liquid denser than crude Eastern petroleum, from which it is claimed that water and sediment will not settle without reducing its specific gravity by the addition of light solvents. But this manner of determining the amount of sediment and water in crude and heavy California oil is in general use.

The following is one of the laws of solution: Let there be two liquids (Summerland oil and petroleum spirits) which dissolve one another only partially; then a homogeneous solution may always be produced by adding a third liquid (in the case of the Summerland oil—turpentine, chloroform, or bisulphide of carbon, which are solvents of asphaltene as well as the spirits of petroleum) which mixes in all proportions with each of the original pair.

Petroleum with an asphaltum base, and the solvents of asphaltene, all possess a high specific gravity, consequently a ternary mixture of crude Summerland oil, the solvents of asphaltene, and petroleum spirits, will require a large proportion of the light petroleum spirits in order to reduce its density to a degree that is suitable for the settlement and separation of water or sediment that may be mechanically held in the oil. For instance, in order to produce a solution of nearly the same density as is employed in the determination of water and sediment in the Eastern oils, the following proportions would have to be employed:

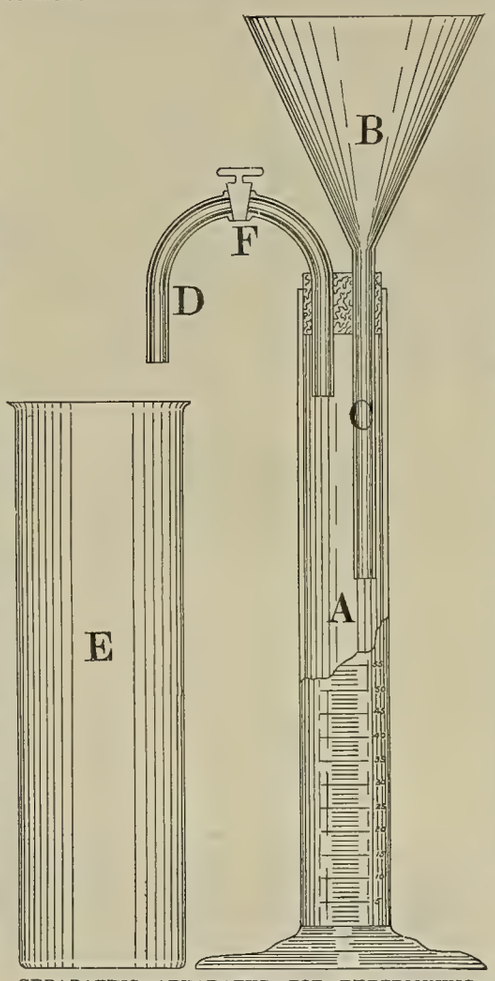
	Specific Gravity.
One part Summerland oil	.957
One part carbon bisulphide	1.292
Fourteen parts petroleum spirits	10.150
	12.399

and 12.399 divided by 16=.775, the specific gravity of the solution, or the following:

	Specific Gravity.
One part Summerland oil	.957
One part turpentine	.870
Five parts petroleum spirits	3.625
	5.452

and 5.452 divided by 7=.779, the specific gravity of the solution.

In reducing the heavy California petroleum oils by solvents to a density equaling the lighter Eastern oils reduced by petroleum spirits, a much larger amount of solvent is required; in fact, the amount of solvent is so great that it becomes impossible to ascertain the amount of water and sediment present by the use of an ordinary graduated glass vessel. To overcome this difficulty, the following apparatus can be used:

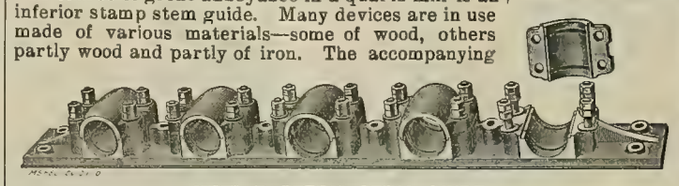


SEPARATING APPARATUS FOR DETERMINING AMOUNT OF WATER AND SEDIMENT IN CRUDE PETROLEUM.

The separator consists of a graduated cylindrical vessel *A*. Extending down into the cylinder *A* is the tube *C*, coming from the funnel *B*, as the water and sediment is heavier than the solutions described above, when the mixture of oil, water and sediment runs into the separator from the tube *C*, the water and sediment sinks to the bottom and the oil runs off through the pipe *D* into the vessel *E*. The cock *F* regulates the flow of the fluids. The amount of oil examined is of such volume that each division of the graduation on the glass is 1% of the same.

A New Battery Stem Guide.

A source of great annoyance in a quartz mill is an inferior stamp stem guide. Many devices are in use made of various materials—some of wood, others partly wood and partly of iron. The accompanying



NEW BATTERY STEM GUIDE.

illustration is that of a new device manufactured by the Globe Iron Works of Stockton, Cal.

There is no wood or babbitt metal used in its construction. It is made of the best quality of cast iron, the back of the guide being one solid piece, secured to the battery guide beam with bolts. The guide is so constructed that any stem can be readily removed, independent of the others. The bolts holding the caps in position do not pass through the back plate, but are set in a recess and may be removed. They are superior to the old-style wooden guides and will not cut or score the stems, as the stems immediately center on coming in contact with the guide.

The stems have very little play in the boxes, moving up and down without perceptible vibration. This has a tendency to make the shoes and dies nearly even and lessens the likelihood of breaking the stems. The weight of the guide complete for five stamps is 165 pounds.

Dredging for Gold.

The gradual erosion of gold-bearing banks by the streams and rivers naturally causes a deposition of strata lower down, containing more or less gold. These alluvial bottoms, sedimentary bars and beds of streams have, until recently, been considered as beyond the reach of any ordinary method of working.

They were not capable of being washed or sluiced, because they were already at the lowest level. Various attempts to dig the material up and elevate it into sluices, from which it could be worked, were made; but the constant presence of water in such workings and the great cost, or impossibility of drainage, rendered such efforts abortive. Miners were compelled to be content with scratching the surface or sinking shallow pits until overcome by the water, and speculating upon the unknown and untold riches that lay just beneath their feet.

The bottom of the alluvial deposit, or "bedrock," as it is termed, is generally where the richest pay is found, due to the natural gravitation of the gold. Thus it comes about that attention has been turned to dredging as a method of reaching these deep and submerged deposits effectively. On the face of it a simple enough problem, yet what vast sums have been spent in the mistaken efforts of those who did not fully appreciate all the conditions involved, and how elusive the little yellow grains are when attacked under water! The seductiveness of the gold attracts many to engage in a mad and determined search for it, and it is not strange that, like moths around a candle, some should come to grief.

The truth is that gold mining is a business which must be learned, like any other business, and it is just as amenable to the natural laws which govern it as any other of the practical sciences. What would be said of a tailor who engages in watch making, or of a merchant who engages to design a bridge or a locomotive? Yet we see the merchant, the manufacturer and the business man launch out into gold mining and make simple calculations of the enormous wealth that can be taken out of their claims at so much per cubic yard, and assume all the responsibility of the practical and technical work.—A. W. Robinson in Cassier's Magazine for May.

The Electro-Zinc Process, and Experimental Researches Which Led to Its Development.

In the issue of Feb. 18th, '99, under the above title, appeared an interesting paper by W. Bettel of Johannesburg, S. A. The author sends corrections, which change certain paragraphs to read as follows:

From the rapidity with which the gold in slimes dissolved in weak cyanide solutions I concluded that the state of division of the finer particles of gold in slimes approximated to that of the particles which, prepared chemically, cause a pink coloration in water, or, as is suggested by R. Zsigmondy, is in actual solution as so-called "colloidal" gold.

I thereupon made a solution of gold containing five milligrammes of gold per litre and added thereto a reducing agent in sufficient excess to separate metallic gold in the pink state. The liquid was then diluted to twenty times its volume.

This represented the amount of gold in an actual slimes pulp, carrying 3% of slimes assaying 5 dwts. fine gold per ton. In this solution was diffused some slimes residues from my filter-press treatment containing no free cyanide and only three grains fine gold per ton, in the proportion of 300 grammes per 10 litres (= 2.2 gallons), and then 22 grains of lime finely ground—the lime was white and well burnt—the slimes precipitated carrying with them practically all the gold.

THE American Smelting & Refining Co., the new corporation comprising the eighteen big smelters of the United States, recently incorporated, it is reported will make Denver, Colo., the center for the purchase and distribution of ores and the headquarters of its metallurgical works.

Metallurgic Standards.*

By FREDERICK T. SNYDER.

It is perhaps because of its great antiquity and the force of established custom that modern scientific methods have been so slowly adopted in metallurgical work. The other industrial branches that have to do with the transformation of power into useful results are found to have standards of comparison complete in proportion, as the industry is young, perhaps the most complete being the youngest of all—the commercial utilization of electricity. There is available in the transactions of various associations of mining interests a mass of records covering the operation of many plants under a wide variety of conditions—records that just miss being of great value, because they are expressed in units that are not standard, making the utilization of the experience they record impracticable. Speaking for my own department of the metallurgy of the precious metals, the great need is a group of standard units by which the results of one establishment may be utilized in planning and operating another under somewhat different circumstances. The most pressing of these are:

First.—A unit of weight.

Second.—A scale of sizes for crushed ore.

Third.—A coefficient that shall represent the mechanical condition of the ore.

Of these, the second has to do with milling work alone; the first and third underlie the operations of both milling and smelting.

The unit of weight is in much the most satisfactory condition. To the extent of which it is individually a factor, results can be expressed in terms whose accuracy lies within the limits of error of the ordinary observation. Its usage and form leave much to be desired. The common unit of weight in metallurgic work is the ton. The question at once arises, in considering a record: which of the four tons in extended use is it? Especially as their variation is too small to admit of the question being answered by a direct consideration of the records themselves. Fortunately, one of them, the metric ton, is rapidly driving the others out of use. It is desirable that forethought should be used in aiding its introduction, that multiple standards of weight may end as soon as practicable. Of the value of its decimal notation little need be said. Its close correspondence with the present English long ton (2205 lbs. in place of 2240 lbs.) involves in its introduction the minimum change in one's standards of experience. An additional feature, of distinct value from our present point of view, is the correspondence it brings about between laboratory and mill calculations. It is desirable that all weights in metallurgic practice should be "dry weights," and that a definite statement of the determination of moisture should form part of each record. It should be understood that competent assays and analysis are always made on dried pulp, and that they are of value only as applied to "dry weights" of ore. The practice of obtaining the weight of ore by calculation from volume is to be condemned. Estimates made in this way are practically worthless as records. Fallacious values that lead to disappointing investments can frequently be traced to this practice. A scale can so readily be introduced at some point in any process on which the pulp can be actually weighed, that a desire to avoid complication can hardly be urged in extenuation.

When we turn to a consideration of units of size, for crushed ore, we are at once in contact with the illusive question of "mesh."

These concentrates were crushed through a thirty-mesh screen. What does it mean? That it was a screen having thirty wires each way per lineal inch? Possibly, that was originally what it meant, but the screen that these concentrates came through had no wire at all. It was an indented slot screen. Even if it had been a wire screen, who is going to tell how much of each thirtieth of an inch was wire and how much hole. Then was it a woven screen or a sewed one? If woven, was it double-crimped or single? But grant that these are all known and made matters of record; that the available free area of the holes has been ascertained by a round taper needle, will this tell what sized tetrahedron of quartz will go through that same hole.

The angle at which the material strikes a screen is a factor in determining the size of the particles that go through.

Forty-mesh pulp (whatever that may mean) is produced by a twelve-mesh screen by throwing the material against it at a small angle—a feature of great importance to leaching plants, where the possibility of dry crushing and screening often means the difference between success and failure. It serves to illustrate most pertinently how wide a range of ratios the mesh of a screen has to the maximum size of the product passing through.

In stamp mill work another indefinite factor is the height of discharge. With the same screen the average size of the issuing pulp can be halved by doubling the height of the discharge. How are we to compare results? Because one battery with a thirty-mesh screen and a 4-inch discharge saves 60% of the gold in an ore on the amalgamated plates below, is it an inferior machine because the next battery with the same thirty-mesh screen, but an 8-inch discharge, saves 70% of the contained gold? A proper screen analysis of the pulp would explain the difference, and again illustrate what an indefinite standard "mesh" is when taken alone.

The necessity for definite data in my own work has led me to abandon screens entirely as primary standards of size and to measure the minimum diameter of the ore particles directly by a specially constructed micrometer. The special features consist in tipping the calipering points with disks one centimeter in diameter, the surface of which are parallel within one-thousandth of a millimeter (one thirty-thousandth of an inch) and in making the lower disk movable. In use, the micrometer is held vertically, the lower disk slid down and the ore particles, wet or dry, put upon it. It is then raised until the stop on the handle comes in contact with an adjustable shoulder. The lower disk is then locked in position by a screw. A series of tests has shown that this lower disk can be repeatedly replaced in the same position within one-five-hundredths of a millimeter, when working rapidly and without especial care. The upper disk is then unlocked by a screw, and, by the handle, is screwed down upon the ore particles. When the pressure of the ore particles reaches a predetermined and uniform pressure, a ratchet in the handle slips and the rotation of the barrel and advance of the disk stops. The amount the disks are separated is then read in hundredths of a millimeter on the scale. The upper disk is retracted by rotating the barrel and the lower disk withdrawn and the ore particles removed. The range of the instrument is from one-hundredth of a millimeter to about four centimeters, the precision being uniform over the entire scale, at about one-five-hundredths of a millimeter for groups of ten observations. It has been used so far entirely in the calibration of laboratory screens. A given material, to be examined, is screened, and the minimum diameter of the maximum-sized particles passed by the screen is determined by the micrometer. This is then marked on the screen and used in records where the mesh of the screen was formerly recorded. It should be noted that the screen will not calibrate the same for different materials, having different systems of cleavage, such as coal and quartz. Independent constants should be determined for each. The following screen analysis of tailings from the Belmont mine, Ontario, stamped through smooth slot screens, called 50 mesh, taken Sept. 27th, '98, will illustrate its use:

Milligrams.	*Per cent.*	*Maximum size millimeters.*	*Through corresponding mesh stamped on screen.*
5,640	100	.83	(on) 40
636	11.3	.50	40
432	7.7	.23	60
4,570	81.1	.17	80
5,638	100.1	...	..

Concentrates crushed on a mortar through a 100-mesh wire screen gave an average of $\frac{1.5}{100}$ of a millimeter. It should be noted from the construction of the micrometer and its method of use that it is the size of the largest particle or the actual free area of the screen that is determined.

A definite unit of size once available, it becomes of interest to determine whether some coefficient cannot be arranged that will permit of legitimate comparisons being made between the work of different mills under different conditions.

Other conditions being the same, it is evident that the amount of gold that will amalgamate from any given ore will be proportionate to the total area of surface exposed by crushing. In a given weight of ore the number of particles is inversely proportional to the cube of the diameter of each particle.

The area of each particle is proportional to the square of the diameter.

Therefore the total surface area of the particles in any given weight of ore is inversely proportionate to the average diameter of the ore particles.

In a leaching proposition the metal dissolved is proportionate to the area exposed, other conditions being equal.

It is evident that the work done in crushing ore is proportionate to the surfaces separated.

*Condensed from a paper read before the Canadian Mining Institute.

A Great Electric Ventilating Fan.

The well-known Hoosac tunnel, near Fitchburg, Mass., will soon be thoroughly ventilated, says the *Electrical Review*. One of the largest ventilating fans ever built will be placed at the western end of the tunnel, and when it is in operation it will draw the smoke-laden gases and atmosphere from the interior. The fan will be 16 feet in diameter, with a capacity of 600,000 cubic feet per minute. It will be operated by electric power.

If this experiment prove successful, it is very likely that ventilating fans of similar design will be employed in ventilating mines. Small fans run by electricity and placed near the face of workings, where the air is bad, would be greatly benefited, as the foul air, being driven out, would be replaced by fresh air from the surface.

Gold Production of Klondike in 1898.

The San Francisco Mint has obtained a statement of the bullion production of Alaska received at U. S. Mints and assay offices and private refineries and smelters during 1898. This statement shows that Alaska produced in that year the sum of $2,517,121 in gold and $127,101 silver (coining value).

There have been all sorts of estimates made of the output of the Klondike for 1898, some of these running as high as $20,000,000. The more conservative persons, however, like the managers of the leading transportation companies, have been inclined to put the amount at about $10,000,000. All the institutions securing gold have made inquiry as to source, that is exact region, and record has been kept of this. The San Francisco Mint has prepared a statement of all bullion of Northwest Territory (Klondike) production received at all U. S. Mints and assay offices and private refineries and smelters throughout the United States during the calendar year 1898. This shows the gold production of the Klondike to have been last year $11,038,478 and the silver $208,156 (coining value), or $80,498 commercial value. This statement proves that the amount of gold and silver named actually came out of the Klondike region in 1898. Doubtless some which was produced in that country during that year is still retained there; and some small amounts may have been carried direct to foreign countries without being sold or minted here. That which was retained will be duly credited to its source when it comes out this season. It must be remembered that in the Klondike the gravel is mined in the winter months and the gold is not washed out until the summer months when the thaw gives a water supply for the purpose. The figures given then practically show the result of the clean-ups of the summer of 1898, though some of the gravel may have been taken out in the fall months of the previous year. In the same way the gravel mined after the freeze in 1898 will only yield its auriferous contents during the summer of 1899. However, as the records are kept by calendar years, all this evens up eventually and the Klondike gets full credit for all its yield. It is not probable that any very large amount above the figures given was produced in the Klondike in 1898, as the number of months following the freeze of that year, and before December 31st, gave plenty of time for the gold to be brought out and counted in the year's returns of yield.

Motors in Mines.

In some of the mines on the Continent where both oil locomotives and electric motors have been used, some comparison between the cost of the two systems is possible. In one mine the cost of the former has been 1½d per train mile, as compared with 3½d in the case of the electric motor. The cost of two oil locomotives is said to have been one-fourth of the cost of one electric motor. The steam, nitrogen and carbonic acid evolved by the former is not enough to vitiate the atmosphere; and it has the advantage of compactness. It works on a 2-foot 1-inch gauge, and when exerting 6 H. P. is able to take a maximum load of seventeen tons. It is said that when running at the maximum speed of four and one-half miles per hour, and with the full load, the consumption of oil is barely six and one-half pounds per hour. An arrangement of friction clutches and chain gear on the crank shaft enables the engine to run backwards or forwards at the will of the operator.—Industries and Iron.

THE copper combine is said to be drawing off much of the speculative capital which would otherwise probably be engaged in exploiting other properties. The appearance of the new copper company is expected to be followed by a period of great activity and excitement in copper companies. It is understood that the basis upon which the different companies will go into the new company is such that on the earnings of the individual companies the new company will be able from the start to earn 6% at least on its $400,000,000 of capital.

THE directors of the New Primrose Mining Co. at Johannesburg, S. A. R., render the following report for the month of February: Mill—160 stamps ran 25 days 22 hours, crushing 21,731 tons of ore, yielding 6251.42 ounces of gold, at a cost of £17,135 2s 8d for milling, mining and general charges, including development, or 15s 9.2d per ton. Cyanide—About 15,096 tons of tailings treated yielded 4409.10 ounces gold; cost, £2617 16s 5d, or 2s 4.9d per ton. Financial—The total cost of working for the month has been £19,752 19s 1d.

NEARLY all the electric energy supplied in Hamilton, Ont., is conveyed from a distance of forty miles by the Cataract Power Co. The works of this company are located at De Cew Falls and were constructed at a cost of $600,000. This sum included not only the erection of a power house and the necessary lines for power transmission, but also a canal connecting with the Welland canal at Allanburg.—Electricity.

Mining Summary.

ALASKA.

It is reported a strike has been made on Forty-Mile, and miners are stampeding from Klondike to the American side.

The newly reported discoveries near Forty Mile are on Jack Wade creek. It is reached by passing up Forty Mile river to Fort Steel and up Steel creek, over the divide in what is known as the Healy mining district. There are side streams running from Jack Wade, but so far only two have been prospected. It is to these unprospected side streams that miners are heading. On Robertson creek as high as 40 cents to the pan was being taken out. It is twelve miles up Wade creek. On claim No. 8 above lower discovery nuggets worth as high as $44 have been picked out of pans that went as high as $22 in fine gold. From one hole $500 was taken. Bedrock is found at a depth of 18 feet.

ARIZONA.

(Special Correspondence.) — The veins at Stockton Hill, Mojave county, are well defined and usually of considerable continuity. In size they vary from a seam to several feet. The ores are principally galena, pyrite and chalcopyrite and zinc blende in greater or less amount. The value is chiefly in the silver, which occurs native in sheets and wires and also in the form of ruby silver, beside black sulphide. Specimens run up into thousands of ounces per ton. A cross lead on the Black Warrior claim is almost wholly quartz carrying a little copper sulphide and visible gold, while the Black Warrior vein itself is a heavily sulphureted vein, with values in silver and little gold. The mines could be reached to a depth of several hundred feet if a long tunnel were driven in from the south side of the hill, a feasible proposition.

Stockton Hill, April 29th, 99.

It is reported that the Old Dominion Copper Co. at Globe has absorbed the property of the Continental Copper Co., the price paid being $60,000 to $70,000.

H. E. Owen has been buying mining properties near Jerome and developing them. He is reported to have made a strike in one and has purchased machinery for development.

Prospectors report finding rich ore in the Canada del Oro, near the Mammoth mine.——The capacity of the Mammoth mine is to be doubled.

Kingman *Mineral Wealth*: Carter & Nellis have made the last payment on the Bullion-Beck mine, an extension of the Mollie Gibson at Chloride.——Jones & Dryden have good ore on the New London mine. It is about to be sold to Los Angeles parties.——The Kingman Sampling Works worked thirty-five tons of T. L. Ayers' ore this week from his mine at Cerbat, also gold ore for G. McGregor, from his mine in El Dorado canyon.——Work of development has commenced on properties near the Sunlight, owned by E. T. Loy and others.

Tucson *Citizen*: J. C. Valentine of Indiana is about to open an old property in the Sierritas, on which the Mexicans operated an arrastra many years.

Phœnix *Republican*: The Lottie mine in the Big Bug district has a tunnel in the ledge 1000 feet. Near the surface several ore chutes are known which will be cut by this tunnel. In this property a year ago, in a 200-foot shaft water was encountered that could not be controlled by pumps, the shaft filling with water. This led to the running of the tunnel.

Tombstone *Epitaph*: G. H. Dunlap is developing a copper property in the Huachuca range. It is the intention of his company to sink a shaft 700 feet in depth. The shaft is now down 300 feet.

CALIFORNIA.

Amador.

(Special Correspondence).—Several mining operations of considerable magnitude at and near Jackson have suspended work the past year. Whatever merit these properties may possess, the owners probably know better than the general public. One of them—the Alma—has expended a large amount of money and opened a great deal of ground. The property has been drifted between 700 and 800 feet along the vein, and about as much more ground lies within the limits of the claim upon which no development has been done. An ore shoot may yet be found by drifting the full length of the claim.

Jackson, May 1st, '99.

Supt. Dye of the Amador Queen No. 1 mine near Jackson will let a contract to run 200 feet of drift on the 1100 level. Power drills are to be used.

Jackson *Republican*: There is a report that the Bunker Hill mine near Amador City will change hands in June.——It is reported that C. D. Lane of Angels has bought two mines near Pine Grove and will soon begin their development.——It is reported that work at the old Newton copper mine at Ranlett, between Jackson and Ione, is to be resumed.——The Bellwether mine at Jackson will pass to a new company which will be known as the Hepburn G. M. Co. The work of sinking will begin in three months.

Butte.

Marysville *Appeal*: G. M. Sparks has filed a claim against Butte county for the sum of $6000, of which amount $4800 is alleged to be due for 240 loads—480-tons—of gold-bearing gravel and tailings removed by O. M. Turner et al. under orders of Supervisor Ormsby from his (Spark's) land and used on the county road. He values said gravel at $10 a ton.

Oroville *Mercury*: Machinery for the Golden Trout mine, on the South Fork between Lumpkin and Strawberry Valley, will arrive soon and the saw mill, which is to cut lumber for the buildings, mill, and mine timbers, will be built. The ledge is said to average 5½ feet, never less than 4 feet. Five tunnels have been run, three on one side and two on the other side of the river, the length of ledge shown being 1500 feet. A shaft is being sunk on the east side of the river and an upraise to connect two of the tunnels has been begun. A 10-stamp mill will probably be erected. J. Watson is Supt.

Calaveras.

At a recent meeting of the stockholders of the Gwin M. Co. the following officers were elected: F. F. Thomas, Pres.; C. S. Benedict, Vice-Pres.; J. J. Crawford, Sec. Directors—E. C. Voorheis, C. M. Belshaw, D. McClure Jr., D. C. Hyland.

A corporation has been organized to operate the Lindsay mine near Angels, about half a mile west of the Utica mine.

San Andreas *Citizen*: Placer mining is active near Wallace; many locations are being made. New claims have recently been located three miles east of Sheep Ranch. The ore is high grade.——The Petticoat mine near Railroad being operated by Rosenfeld & Sons of San Francisco is looking well. There are 3000 tons of ore on the dump.——J. W. Anthony, representing San Francisco capitalists, has purchased the Oro Fino gravel mine on the Williams ranch, midway between San Andreas and Mokelumne Hill, from Edwards & Co. The mine has been worked in a primitive way. There is a tunnel 200 feet from which a crosscut 100 feet has been run and the old river bed found. Buildings will be erected on the property, new machinery will be placed and a process new to this county for handling gravel introduced.——At the Thorpe mine near Fourth Crossing thirty stamps are dropping, and sixty men are employed. The mill is operated with electric power and is lighted with electricity. The hoist is run by steam.

Mokelumne Hill *Chronicle*: It is reported that an addition of twenty stamps is to be made to the mill of the Gladiator mine, on Mokelumne river, making thirty. S. H. Lucas is Supt.——The Keystone mill is crushing ore from the Petticoat mine, near Railroad Flat.——Howard & Heuston have finished timbering the New York mine, near Railroad. The shaft is down 140 feet and is 4x8. The property will be developed by a San Francisco company.——Alexander & Parker of Cripple Creek, Colo., are to open up the Fair View mine, near Railroad.——The shaft on the Keystone mine is to be sunk 500 feet deeper.——The Kangaroo mine, owned by Beals & Trainor, one-half mile from Railroad, has a vein which averages 3 feet in width. Four shafts have been sunk on the mine, two of them being double-compartment. The deepest is 60 feet; one is 40 and two 30 feet.

San Andreas *Prospect*: It is reported that a strike was made in one of the upper levels of the Paragon mine near Railroad Flat recently. The company will drive a tunnel into the hill 1000 feet, which will tap the ledge at a greater depth. A large compressor will be installed, grading for which is in progress.——At the Petticoat mine, Railroad Flat, a pump station is being excavated at the 450 level. From a mill test the ore bodies in the 450 level proved better than expected. A contract has been let to sink the shaft 200 feet deeper.——Prospectors between Railroad Flat and West Point found pockets recently from which they took several thousand dollars.——The water is being taken out of the Poorman mine near Railroad Flat and the shaft retimbered.

El Dorado.

E. W. Chapman is developing the Gold Note mine, twenty-seven miles above Placerville. A double-compartment shaft is down 400 feet. The ledge runs from 5 to 7 feet in width. A new 20-stamp mill has been built and will soon commence crushing. Steam power is used. Water power will be added with a pressure of 400 feet.

Placerville *Republican*: A rich body of ore was discovered in the Mt. Pleasant mine near Grizzly Flat last week.

Placerville *Democrat*: A San Francisco company is about to take a bond on the Selby near Placerville.——The custom mill is running on ore from the Skinner mine near Placerville.

Inyo.

(Special Correspondence).—John Baxter is working a gold mine near Coso.——Rich gold rock is being taken from the Barnes & Anderson mine near Independence. Johnson and McGinnis also have a good prospect near the former mine.——D. Holland and partners have a 3-foot vein in the Guadalupe mine at Beveridge. Five men are at work sacking ore.——In the Panamint district the Harrison & Godmark 10-stamp mill in Pleasant Canyon is running.——It is reported that the World Beater has been sold by the Montgomerys. The ore is to be crushed in a rotary mill.——Thirty men are at work in the Anvil Springs camp eighteen miles south of Ballarat.——A. Williams has 12 feet of ore in the Birdie mine in Tuber canyon.——It is reported that the railroad is to be extended from Johannesburg in Kern county to Ballerat.

Kern.

A rich gold strike is reported from the desert, ten miles southeast of Kramer station. For a year Clarke, Duncan & Goldsberry have been dry-washing in that locality. Last November they found pay near Kramer. While dry-washing, they prospected for ledges. In January they found them. They have located twelve claims. The formation is described as quartzite and porphyry and the vein 20 feet wide.

Merced.

Hollister *Free Lance*: Coal has been discovered in the mountains southwest of Los Banos. Samples show the coal to be of good quality.

Napa.

The Ætna Co. is developing new ground, and the prospect is reported promising.

Mariposa.

(Special Correspondence).—It is again semi-officially reported that the Merced Co. will build an electric plant on the Merced river this season. Surveys of the river have been made from Merced Falls to Yosemite. The site selected is said to be just within the National Reservation.

Kendall Bros. & Whitney, who, under a bond, have been developing the Quail mine on Indian Gulch, have about completed a sale of their interests. At 700 feet their tunnel cut the ledge, showing 18 inches of high-grade ore.

The Mt. Gaines mill, near Hornitos, is now operating with electricity transmitted from Merced Falls.

The crosscut at the 200 level in the Murphy mine has cut the vein.

The 6-stamp mill on the Porter mine will be running by May 10th. Sinking will be at once resumed on the Mary Harrison and carried down to the 1000 level at least. Exploration of the hanging-wall country by crosscuts continues, the output of the mill has been somewhat increased of late by changes and additions to the crusher plant. Contracts have been awarded for a year's supply of wood for mine and mill, also for 2500 ties for the tramway to replace those of "Digger" pine laid a year ago.

Bear Valley, May 1st, '99.

Nevada.

The Grass Valley Miners' Union has joined the Western Federation of Miners.

Grass Valley *Union*: Last October a deal was consummated at Spenceville in the western part of this county of which no mention has been made. The paint and copper works there were sold to a company headed by M. B. Kerr. The copper mine has produced at a depth of 200 feet 50,000 tons of copper ore and the ore between the 200 and 100 levels has not been stoped out.——The new reservoir for the Empire M. Co. will be built by Horan Bros. It will be 310 feet long, 75 feet wide, with an average depth of 7 feet; 125,000 cubic feet will be excavated.

Grass Valley *Union*: Morse Bros. and J. Quinn are getting out timbers for a mill, which will be built on the property of the Otsego M. Co., on the Middle Fork, near Dodsons. Excavations for the mill have been completed. A wire rope tramway 1000 feet long will transport the ore from mine to mill.

Grass Valley *Union*: Thos. Hall shot and killed a Chinaman whom he found robbing his sluices at French Corral, a few days since.

Nevada City *Transcript*: S. Poorman of San Francisco and H. Davis of Auburn are at the Poorman & Hastings claim on the Middle Yuba, near Columbia Hill. The derrick and flumes washed away during winter will be replaced and the claim operated again.

Nevada City *Herald*: The Slide M. Co., operating on the South Yuba river, a mile and a half east of French Corral, will build a 10-stamp mill on its property, to be operated by electricity.

Placer.

Work is in progress at the Little Dipper mine near the Iowa Hill grade in Shirt Tail canyon. The mine is owned by Holmes & Pease of Yankee Jims. The old works have been timbered and arrangements are being made to breast the new gravel recently found.

J. Harrison, who is working the St. George gravel mine, has finished an upraise and is preparing to take out gravel. The tunnel is in 1200 feet.

G. A. Colwell has been taking out good gravel at his mine on Shirt Tail canyon. He is also prospecting a quartz ledge near his gravel claim.

Kavanaugh, Dougherty and Hodder, who have a lease on the Small Hope gravel mine, are cleaning bedrock. The mine is owned by Cranage & Federer.

The Trafton claim on Georgia Hill is being worked on a lease by Gilbert, McCoy, Lowell and Findley. The lessees are hydraulicking under permit from the U. S. Debris Commission. They use 100 inches of water under a pressure of 150 feet.

Auburn *Leader*: At Valley View mine new machinery is being put in which will double the capacity of the plant.——The Blue Canyon M. & D. Co. has its Azalea tunnel in 1430 feet, run for a gravel channel. Quartz veins have been struck in the tunnel.——At the California mine in Washington district a tunnel 2100 feet cuts the vein at a depth of 700 feet, and the ledge is 30 feet wide. The ore averages $6 per ton and is worked in a 20-stamp mill. The company will put in twenty more stamps this spring. The Supt. is Dana Harmon.——The Giant King near Washington is being developed by a San Francisco company, A. Pugh, Mgr. They have a large ledge of low-grade ore so situated as to handle it at a low figure. The same company is developing the Dillon mines, where they have a tunnel in on the vein 400 feet, with a depth of 250 feet.——The Eagle Bird has a 30-stamp mill at work. The mine is 800 feet deep. Thirty men are employed. G. W. Hall is Supt.——The Gray Eagle mine has a new air plant and is running a crosscut to tap the ledge 400 feet below the workings. J. Cohoe is Supt. This company has a mine on Canyon creek which is being developed.——The St. Patrick mines, six claims, on a ledge 50 feet wide, are opened by tunnels, giving a depth of 600 feet. They are building a 20-stamp mill and expect to add twenty more.

Grass Valley *Telegraph*: Directors of the Morning Star M. Co. held a meeting May 1st at Colfax. Pres. Neff and F. Richards were present. They decided to declare a dividend, No. 101, but the amount has not yet been made public. The dividends for March and April were $2.50 per share and in February was $3.50. For some time a hard formation has been encountered and the usual amount of gravel has not been taken out. The usual output is 900 cars a week, at present only 550 carloads being extracted.

Auburn *Herald*: Supt. T. W. Waterhouse has rebuilt the hoisting works at the Grass Ravine mine, which was burned a short time since, and is sinking the prospect shaft to 400 feet. The shaft is 235 feet deep in quartz. Six men are employed. The mill will be rebuilt as soon as the ore justifies. The ore from the bottom of the shaft shows galena sulphurets.——The Hathaway shaft, near Ophir, is down 630 feet and the ledge averages 2½ feet in width. The regular force is forty men, part of whom have been laid off during the repairing of the mill. Water is the motive power. The ledge runs east and west. A. B. Eastwood is Supt.——The Gold Blossom employs forty men. The mill has twenty stamps. The hoisting works are run by steam and the mill by water.——The Boulder mine, near Ophir, has been bonded and the shaft will be sunk deeper.——At the Bellevue the shaft is down 160 feet in good ore. The lessees, Brye & Lozano, have taken out some rich mill and sulphureted rock. The three shafts are to be sunk 1000 feet. These shafts are called the Center Star, the Belmont and the Almont. The first is 725, the second 250 and the third 530 feet deep. All the hoisting and drilling is done by air. Forty men are employed. E. J. Kendall is Mgr.

Colfax *Sentinel*: T. Browne, formerly of Red Point, has leased the Paragon drift mine at Bath and has with him D. J. Wheeler and W. H. Rea. They have given a sublease to Allen & Brown, who will work ten men, and also to Duffey & Greenwood. Work has commenced.——Development is in progress at the Caledonia mine on the middle fork of the American below Michigan Bluff. The ledge averages 5 feet. The upper tunnel is in 200 feet. Five men are running a tunnel 217 feet lower, now in 65 feet. The property has a 10-stamp mill.——At the Star drift mine at Last Chance, owned by G. Ray and H. May, two men make good wages from five cars of gravel per day.——Rich gravel is being taken from the El Dorado drift mine at Last Chance, owned by Ray & Co. The main tunnel is in 3600 feet.——At the Bishop mine at Last Chance, owned by H. Parmlee, one shift of men is taking out gravel. The main tunnel is in 1800 feet. Gravel is being taken from 300 feet in.——At the Savage mine near Bald mountain six men are employed. Supt. Savage is drifting north and south on the 200 level.——B. Kavanaugh is working his gravel mine on Bald mountain, where three men are employed sluicing. This claim has been worked each season for twenty years.——The Blue Eyes, a bench claim in Duncan canyon, near Bald mountain, is being worked with a pipe and sluices. The mine is owned by A. Nylen, Mrs. J. Dougherty, A. F. Sheehan and L. Woodworth.——J. Hodges of Yankee Jims is getting good returns from his gravel mine on the American river below Colfax.——The Washington drift mine is being worked by H. F. Adams. The tunnel is in 1000 feet.——The Cranage claim, owned by Federer, Enos & Cranage, northwest of the Small Hopes, is being worked on a lease by A. McCullom of Yankee Jims.

Plumas.

Quincy *Bulletin*: Eight stamps of the Crescent mill, near Crescent, are running, crushing ore from the Washington mine, owned by J. McGrath. Four more stamps will be started soon.——One hundred tons of ore taken from Dr. Carter's mine, near Crescent mills, was recently worked in the Crescent mill and yielded $5 per ton. J. Ghidotti has leased the mine from Dr. Carter.

Riverside.

Los Angeles *Mining and Metallurgical Journal*: At Virginia Dale the O. K. mine is the best developed mine in the district. It is down 200 feet, and the ledge is wider than at the surface, and is better ore. J. Ingersoll of San Bernardino is Mgr. He intends to sink another 100 feet, which will make the shaft 300 feet deep. The O. K. ledge is one of the strongest leads in the camp, there being 18,000 feet of this ledge located and many good prospects. Commencing at the south end and going north, first, is the Greenhorn, owned by Baird & Perry of Rialto, Cal.; the M. L., belonging to Palmer & Wellington of Los Angeles; O. K., owned by the O. K. Co.; Gold Basin No. 2, belonging to I. Reed; Single Standard; Dale, belonging to Reed & Curtis; Pipton, belonging to H. B. Botsford of Los Angeles; Jumbo, belonging to Ellerman & St. German; White Star, belonging to Furguson Bros., who have three more locations north of the White Star. The Greenhorn has a prospect shaft 12 feet. The M. L. has two prospect shafts; the O. K. one 20-foot shaft and main shaft 200 feet. It has 250 feet of drift at the 50-foot level, with upraise to the surface. At the 100-foot level it has a drift north 100 feet and south 200 feet, with upraise to the 50-foot level; and at 150 feet has 200 feet of drift running south, with upraise to the 100, and are drifting north and south at the 200. No ore has been stoped. The Gold Basin No. 2 has two shafts, one 50 feet and one 110 feet deep. The Single Standard has a tunnel in 50 feet. The Dale has one shaft 30 feet. The Jumbo has one shaft 80 feet and another 130 feet, with 100 feet of drift. The White Star has a shaft down about 150 feet, with some drifts and a tunnel 1400 feet in length.

Los Angeles *Herald*: McHaney & Pinkham have found a new mine. McHaney is one of the locators of the Desert Queen mine, and says the rock will average better than the Queen. The mine is twelve miles north of Indio. The vein is 4 feet wide.

Winchester *Recorder*: J. Norton has bought of W. P. Rice his interest in the Lettie and Anaconda mines south of Winchester. Assays show the ore to be rich.——Development at the Utica mine, twelve miles west of Winchester, shows a good body of ore.

San Benito.

Boston *News Bureau*: The New Idria Co. is sinking a new shaft, now down 200 feet, and should soon be in shape to double its output.

San Bernardino.

Redlands *Citrograph*: T. H. Oxnam and ten men from Delamar, Nev., arrived in Victor last week and went to the Gold Mountain

mines, where they will do development work on mines belonging to E. J. Baldwin of San Francisco. There has been no work done on these claims for twenty years.——The Silver Mountain mining district at Oro Grande has filed papers for record at the county recorder's office setting forth the reorganization of the district.

San Diego.

Los Angeles *Mining Review*: Straus & Shinn, who are operating the cyanide plant at the Stonewall mill, near Cuyamaca reservoir, are having trouble with the water company, who use the lake as a storage reservoir. The cyanide men were careful in placing their plant to avoid the possibility of contaminating the waters of the lake with cyanide solution. The tailings are elevated over a rise in the hill south of the lake and dumped into a gulch not tributary to the lake.

Shasta.

Redding *Free Press*: The Mountain Copper Co. will soon build a second matte furnace having double the capacity of the present furnace.

Sierra.

Downieville *Messenger*: Another strike has been made in the Mountain mine. The mill will soon be ready to run forty stamps.——W. York is running the lower tunnel and sinking the shaft at his mine. Some rock has been found in the lower tunnel, which prospects well. The mill is running day times.

National Bulletin: The Feather Fork G. M. Co. is washing the tailings dumped at the Thistle Shaft mine.

Solano.

Cordelia *X-Ray*: A flow of gas has been struck in a well at the Page tract below Cordelia, where boring for oil is in progress. The depth reached is 400 feet.

Tulare.

Porterville *Enterprise*: The principal mining district in this county is White River, twenty-five miles south of Porterville. Over $50,000 has been taken out during one year with the old way of mining, improved machinery as yet not having made its appearance. There are a 5-stamp mill and a 10-stamp mill. The ore is gold-bearing quartz, mostly oxidized. There are several other districts which have promising prospects. Four miles from Mountain Home are deposits of copper owned in Los Angeles.

Tuolumne.

At No. 2 level of the Santa Ysabel, on Quartz mountain, the ore body is 17 to 18 inches wide and 18 to 20 feet long; at No. 3 it is 5½ feet wide and 75 feet long; at No. 4 it is 8 feet wide and from 120 to 130 feet long. The width on the fifth level has not yet been ascertained. The striking of the Central ore chute on the fifth level demonstrates the continuity of the ore body and increases the reserves. Stoping has been started at the fourth level. At the fourth level and above the Central ore chute has averaged $12 to $14 per ton.

Sonora *Independent*: At the Shawmut-Eagle mine, near Jacksonville, 175 men are employed.——L. Green of the Jim Budd mine, on Eagle creek, near Columbia, reports the new shaft down 35 feet and a 2-foot vein of ore in sight.——Page & Vassallo, who bought the Potter place at Springfield, on which there is a quartz mine, have begun sinking on the vein.——It is reported that the Grey Eagle mine at American Camp will be started up. A new shaft will be sunk, operated by a steam hoist. The gasoline engine, formerly used for hoisting, will run the mill.

Jamestown *Magnet*: J. E. Nelson is developing the Black Star claim near Jacksonville. He is down 40 feet on the ledge.——A. G. Wiedekind has leased his gravel and quartz claims near Pine Log to Mr. Watkins and associates of Salinas, who have also purchased a quarter interest in the John Royal mine at Summit Pass, near Columbia.

Sonora *Union-Democrat*: The Mount Jefferson mine at Groveland is to have a 20-stamp mill.——The Free Lance mine, on the Tuolumne river near Ward's Ferry bridge, has been bonded to P. R. & F. J. Gardner and C. A. Myer of San Francisco for $6000, $1000 of which was paid down. The vein in a 130-foot tunnel averages 3 feet wide. A second tunnel will be started below the first. A mill is also contemplated. P. R. Gardner is Supt.——The Jubilee M. Co. at the Hazel Dell, eight miles north of Soulsbyville, is drifting. The vein has widened from 2 to 3½ feet. Two power drills are being put in. The 2-stamp will be completed in two weeks.——It is reported that the Sweeney mine at Quartz mountain, adjoining the Dutch on the north, will be put in active operation.——It is reported the Clio group of claims near Jacksonville are to be developed by Boston capital.

COLORADO.

BOULDER COUNTY.

Ward *Miner*: The Cold Spring group of eleven claims at Gold Hill has been sold for $75,000, the Bordeaux group of ten claims for $80,000 and the White Cloud mine for $13,000. The Bordeaux group was owned by G. Teal and G. Rogers. One-fourth of the purchase price was cash. The purchasers are the Cold Spring G. M. & M. Co. Its incorporators are W. H. Combs, J. M. Page and P. J. C. Robinson.——The Rag Tag Co. are preparing to resume operations on Michigan mountain. They are considering putting on a steam hoisting plant. They will resume sinking this month.——The Adit Dewdrop has forty men on the payroll and will add to this force as the work progresses. Three power drills are now run in the main and north tunnels and upraise, and three more machines have arrived which will give employment to more men.

CLEAR CREEK COUNTY.

The Delta-Hudson mine, in Virginia canyon, is now being worked under the management of the Denver Mines Agency Co.

A strike is reported in the Hardscrabble lode. The claim is in Pinckard gulch, west of the Shively. Assays from the streak which Mr. Frazier has opened gave 420 ounces silver, 20% lead and one-tenth of an ounce gold per ton.

The Pratt G. M. Co. has been organized at Yankee to acquire a group of claims at that place. A number of Virginia capitalists are interested in the company. They are making direct purchases. Machinery is to be installed. They will build a concentrating mill, 100 tons daily capacity. All veins have been tested and a number of lots of ore have been tried by the mills at Idaho Springs.

The Chesapeake tunnel at Yankee has been compelled to close down until the snow disappears, for it is impossible to get fuel to the tunnel. The company has a streak of mineral opened near the breast and for 400 feet have a continuous streak of pay ore.

The Butler Co. will resume work in the Cornucopia on Chicago creek. The shaft on the south side of the creek will be sunk and the adit on the north side extended toward a junction of this with another vein.

A. H. Colburn, who has a lease on the Silver Age for three years, will sink the new shaft at the mouth of the adit and drive levels into the ore bodies found in the winzes sunk from the adit. This ore is lead with gold and silver values.

FREMONT COUNTY.

Denver *Republican*: The first test run of the Junior Order cyanide plant at Bare Hills has been made and demonstrated a success. The cleanup shows an extraction of 95% at a cost of $1 per ton for mining and treatment. The mine is low grade, located on a diabase dike, from 20 to 30 feet in width. The plant is built close to the shaft, the ore trammed direct to the bins in the mill, a distance of 30 feet. Water is supplied from the old shaft, 100 feet in depth. Cyanide is adapted to the treatment of this ore, as, with coarse crushing, the values are extracted to 40 cents per ton in forty-eight hours. It is stated that arrangements will be commenced for a 100-ton plant.

GUNNISON COUNTY.

(Special Correspondence).—The snow is now nearly gone from the gold belt and things are taking on a lively aspect, with promise of an increased summer's work. Many new properties are being opened and a large per cent of them are finding good bodies of pay ore, and in the future I shall record what I have seen personally at these properties. It is reported that a rich strike has been made in the crosscut at the 150 station in the Gunnison. The last 5 feet of the vein on the north side shows a great deal of free gold and it is thought will run two to five ounces per ton. The vein at this crosscut shows a width of 20 feet solid quartz, all pay milling ore. It also is observed at this station that its width has increased a little with depth. Sinking is going on and at 200 feet and 250 feet crosscuts will be run to determine its width at those points. The management will then run levels and further develop the property. The erection of a mill at the mine is contemplated.

An option has lately been secured on the Eureka and Antioch claims by G. W. Bartholomew. The property is situated just west of the town of Du Boise on Goose creek. The claims run northerly and southerly and lie side by side. The main shaft is on the Eureka and is 100 feet deep. It was started on the vein, but at 20 feet the vein left the shaft, which was continued straight down. It is the intention to crosscut at the bottom of the shaft to the vein. Where the vein left the shaft it is 4 feet wide and carries good values in gold, lead and silver. The ore is generally soft and shows a good per cent in lead carbonates, from one to two ounces gold and ten to sixty ounces silver. A tunnel 400 feet long from Goose creek will give a depth of 400 feet at the shaft.

The vein on the Antioch is less promising, but it may be all right when opened. The Pride of Denver joins it on the west, where they claim to have shipping ore, its values principally gold.

East and adjoining the Eureka is the Mollie's Dream, worked by a tunnel from a gulch on the north end of the claim. Mr. Griffie says he has considerable ore saved for shipment on the dump. The vein is 2 to 3 feet wide and is lead carbonate, with from one-half an ounce to two ounces of gold, also some silver.

The Iowa, a silver-lead property, has been bonded to G. W. Bartholomew by H. F. Smith of Indiana. The property is a patented claim and has considerable work on it, exposing large bodies of argentiferous galena. Ores that would not stand transportation when the work was done can now be shipped at a profit. The values in lead are about 28% and from ten to sixty ounces of silver. The vein is from 10 to 12 feet wide and most of the ore will ship without concentrating. Work will be started on this property the middle of July. The bond price is $10,000, running two years from August 1st, '99.

At Quartz, near Pitkin, the Maid of Athens Co. have several hundred tons of ore on the track and ore bins full, awaiting shipment, which will commence as soon as the Colorado Southern is open. It is reported that this vein is over 30 feet wide and is improving. The mine is not deep, being new. The ore shoot was opened less than a year ago and today can output 100 tons per day. The value is chiefly in silver, with a little lead.

The Citizen, an extension of the Maid of Athens, has a 6-foot vein of gray copper running high in silver as well as copper.

Gunnison, Colo., April 25th, '99.

It is reported that the Vulcan, Chimney and Good Hope mines are to be purchased by a Boston syndicate, the buyers taking 51% of stock for $4,500,000.

LAKE COUNTY.

Mining Investor: S. D. Nicholson and his associates have combined under one management a large portion of Carbonate hill. The combination has brought under one management a number of leases and properties, making a total of eighty acres, with a number of shafts reaching down to various contacts, which are now being worked through the several shafts. The chief operations will be conducted through the Wolftone shaft, which is to be sunk to a depth of 1500 feet. The combination takes in the Mab, in which is a large body of ore at a depth of 1000 feet in the second contact. It was found last September by running a level from the bottom of the shaft, 800 feet. The ore is being extracted through the Mab shaft at the rate of 4500 tons per month, and at present this shaft is the chief producer in the combination. The ores are sulphides of iron and lead, the values being in silver and gold. From one of the stopes 100-ounce silver ore is being broken. The Wolftone shaft is outputting 600 tons per month.

Leadville *Miner*: Another strike has been made in the Valley City and Forest Rose mine. Six feet of work had been done when the ore was encountered. It is lead carbonate, carrying silver and gold. The carbonate runs 60% to 70% lead. The mine was recently leased by R. Fogel to Pres. Gates of the Illinois Steel Works, C. T. Roberts and others.——At the Bon Air shaft Supt. Newell has caught up and retimbered the shaft to a depth of 200 feet and good progress is being made.

MONTROSE COUNTY.

The La Sal Copper Co. continues shipments of ore, thirty-five teams being engaged in freighting the ore to the railroad at Placerville. The values continue unchanged.

OURAY COUNTY.

The Caroline M. Co. have a concentrating mill of 500 tons daily capacity in operation at Ouray.

PUEBLO COUNTY.

It is reported that the capacity of the Philadelphia Smelter & Refining Works at Pueblo is to be increased 40%, and the improvements will be started at once. New blast furnaces will be erected, with all the latest machinery. Eight roasters will also be erected. The copper plant will be enlarged, doubling the capacity. There are employed 800 men; and when the improvements are completed, the number will be increased to 1200.

TELLER COUNTY.

Victor *Record*: McDonald & Isaacson, leasing on block 3 of the Lonaconing of the Kimberly Co., have rich ore in the bottom level of the mine at a depth of 240 feet. In addition to a body of medium-grade ore, there is a seam, several inches wide, which shows sylvanite. This lease has previously mined medium-grade ore.——On the Lansing of the Pinnacle Co. a perpendicular working shaft is to be sunk. A contract for 100 feet has been let. An 8x10 steam hoist and boiler has been contracted for.——Van Norman, Thurston & others, leasing the Homestake on Big Bull mountain—the eastern limits of Goldfield—have their steam plant in operation and are hoisting rich ore showing free gold. The pay streak is small.

Denver *Republican*: It is estimated that there are 6,000,000 tons of ore in the dumps of Cripple Creek mines, valued at $5 per ton. Owners are receiving bids from mill men to work this ore.

IDAHO.

The Blue Jacket mine, in the Seven Devils, has 5 feet of solid copper ore in a 22-foot vein. It is cut by a tunnel 450 feet long at a depth of 310 feet. The ore also carries gold.

The present strike in the Cœur d'Alene mining district was inaugurated about April 20th and is directed principally against the Bunker Hill and Sullivan mines at Warder, where non-union men are employed. The demands of the miners for increased wages were met by the mine owners, but the miners demanded that the union be recognized and that non-union men be discharged. This the mine owners refused, and the Last Chance mine closed down. The Bunker Hill and Sullivan continued to run with non-union men until April 30th, when the concentrating mill and other buildings of the Bunker Hill and Sullivan Co. were blown up and destroyed by fire and the the non-union men driven out.

Work on the Humming Bird mine is in full blast. Brown & Rose have the contract for sinking the main shaft and have two shifts at work. It will take sixty days to complete the contract.

Spokesman-Review: J. Jones has resumed work on the Silver Eagle in Dobson's gulch near Wallace. It has been a year since work was done there except to sink a few feet last summer from near the face of the tunnel.——A mill has been ordered for the Conjecture mine on lake Pend d'Oreille.

Salt Lake *Herald*: The Melcher M. Co., whose property is in the Stokes mining district, Cassia county, will put in steam drills. The machinery is ordered. The tunnel will be run to cut six veins which parallel each other across the property. When the last vein has been cut a depth of 1700 feet will have been attained. The mine is thirty miles north of Kelton, on the Central Pacific.

Hailey *News-Miner*: The pump and pipe line at the Tiptop mine work successfully. The line of pipe is two miles long and takes water from Rock creek to supply the 20-stamp mill. The water has to be raised perpendicularly about 900 feet.——A company has been organized in Utah, known as the Harvest M. Co., capital $100,000, for working the Washington mine in Boise basin.

Grangeville *Press*: W. H. Walp, Supt. of the Iron Crown mine on Newsome creek, has $2110, proceeds of a mill run of 110 hours. The Iron Crown mine is a porphyry dyke running the full width of two claims. Since last fall 600 feet of tunnel has been run on the vein. From this tunnel four crosscuts have been run east and west. The mine is on the summit of the low divide between Newsome and Beaver creeks, at the head of the Allison gulch diggings, which were rich in placer gold. It is a blanket ledge on top of the hill.

MICHIGAN.

The Queen group of iron mines at Negaunee have been sold and transferred to the Oliver Iron Co., controlled by A. Carnegie. The Queen is a non-Bessemer, hematite mine, which since 1886 has produced 2,918,000 tons of ore.

The consolidation of the Ashbed and Humboldt mines is contemplated with the erection of a new mill and smelter at Eagle Harbor.

Boston *Financial News*: The Franklin M. Co. will by the middle of May start its mill. The company will then have expended on improvements $650,000. It is planned to stamp 1000 tons of rock per day at first and from that work up to 1500 tons. On the basis of 1000 tons the yield should be 30,000 pounds of copper per day.

MONTANA.

At Hassel it is reported that large ore bodies have been opened on the Cambria property, and it is thought to be the continuation of the Diamond Hill property which recently sold for $2,000,000.

The annual report of the United States Assay Office shows the following total mineral products of the State for '98:

	Fine Ounces.	*Value.*
Gold	253,867	$5,247,912 91
Silver	14,818,661	19,150,482 15
	Fine Pounds.	*Value.*
Copper	216,979,354	$26,162,616 20
Lead	21,403,592	860,055 70
Total value of production		$51,319,067 15

In gold Montana is third, both Colorado and California leading.

NEVADA.

The following telegram from Manager Ross explains the present situation on the Comstock: "Aug. Waterman, Sec'y Comstock Pumping Association, San Francisco—Elevator working steadily. Water in the 1750-foot level winze is 40 feet below the station." The work of installing the second elevator and attachments below the 1850-foot level of the C. & C. shaft is proceeding with all the expedition possible. It is expected that the new extension of the plant will be in operation by the 8th inst.

F. Emmitt, U. S. Marshal, last week posted official notices of sale upon the Silver Peak mining property, so long in litigation. This sale is advertised under the decree of court to take place by the Marshal on Thursday, May 25th, to satisfy the mortgages held by J. I. Blair, aggregating $642,140.85.

White Pine *News*: The discovery of a gold ledge west of White Pine, and its sale to Salt Lake people, has stimulated prospecting for gold in the mountains south. These mountains have been prospected for silver in years gone by, but no attention was paid to gold, and ledges cropping out prove to contain gold.——W. Watson of Ely and a companion found some very rich gold float, which, on horning, proved most satisfactory, so the boys next morning found a ledge of gold ore. These mines are six miles south of Cherry Creek.

Men have been put to work the past week on the Belcher and Yellow Jacket mines at Gold Hill. Work was also recommenced on the Hale & Norcross mine in the old tunnel, in which nothing has been done for five years.

The April Fool mine at De Lamar has been sold to A. H. Wethey of Butte, Mont., for $25,000. In the instrument of transfer Mr. Wethey is referred to as trustee. It is presumed he represents W. A. Clark. The property comprises five locations. The ore milled thus far runs $25 per ton.

Carson *Appeal*: The Little Bonanza mine near the Delphia property in Smith valley will be developed and a mill built. The property will be operated under the name of the Cayahago G. M. & M. Co.

Genoa *Courier*: E. Raycraft has two men at work on two mining claims back of Carter's station in Pine Nut. One is an old location known as the Betsy Jane; the other is new. Assays made of the rock return $22 in gold, 88 ounces in silver and $28 in gold, 51 ounces in silver, respectively. Both assays show 10% antimony.

Ely *News*: A coppor strike is reported from the Morris mine in West Camp.

Salt Lake *Tribune*: The first payment of $25,000 has been made by O. Stalmann on the purchase of the Copper Basin mines in Humboldt county. The total price is reported at $100,000. The property consists of twenty-one claims, the ores from which have been going to the smelter at Golconda and average 12% copper with $10 in gold.——The Glasgow & Western M. Co. of Salt Lake has made its third payment of $20,000 on the purchase of the Copper Canyon group of claims in Humboldt county. The total amount involved is $110,000. The company reports a steady output that averages 18% copper.

Salt Lake *Tribune*: H. E. Fruedenthal has bought a two-thirds interest in the Iron Silver mine, Bristol district, Nevada, for $15,000. A consignment of ore showed 32% copper, sixteen ounces silver and 70 cents in gold. The mine was owned by the J. Gilmer estate and had been idle for years.

NEW MEXICO.

It is rumored that the Standard Oil Co. have offered the Hearst estate $200,000 for its option of $1,200,000 on the Santa Rita mines. The option was not transferable; but, by agreement with the Bonanza Development Co., who are interested in the option, the non-transferable clause has been eliminated. The Standard Oil offer holds good until July 1.

Silver City *Enterprise*: The Romero mine, at Santa Rita, has been pumped out to the 100 level, where there is about 3000 feet of drifts and crosscuts, with little stoping. The mine was found in better condition and the ore richer than anticipated. There are sheets of copper from ¼-inch to 6 inches in thickness, in addition to the mass of ore, which contains cuprite, tenorite and melaconite. The average of ore shipped from the camp runs above 20% copper. The mine will be opened to the bottom of the 500-foot level.

Hillsboro *Advocate*: At the Black Maria, the working force has been doubled.——A

strike of copper sulphides has been made in the north workings of the Opportunity.——The Richmond is making a 100-ton shipment to the Trippe mill. —— Foreman Jack Burke has made a strike on the Robins & Crews Snake mine lease.——The Trippe mine made a 60-ton shipment to the El Paso smelters during the week.——W. F. Hall has taken a lease and bond on the Mastodon, and has eight men.——Six men have been added to the Warren mine force.——S. F. Keller is making a shipment of $130 ore to the Silver City Reduction Works. —— The Charter Oak and Percha mills sent $9980 in gold bars to the refinery. —— The total output of Hillsboro mines from Jan. 1st to April 27th, '99, was 4705 tons.

Denver *Republican*: Gilchrist & Dawson have purchased a twenty-four-one-hundredths interest in the Hanover copper mine at Hanover.——The Colorado Fuel & Iron Co. has increased its daily shipments of iron ore to Pueblo to 100 tons.——The water has been pumped out of the Romero copper mine at Santa Rita. The ore body was found larger and richer than anticipated. The poorest of the ore runs 20%.——A strike of gold ore averaging $32 to the ton has been made at White Oaks. The district is in better condition than in years.

OREGON.

(Special Correspondence).—The James Arthur placer mines at Cornucopia will commence operations May 10th with a full head of water, which will probably continue all season.

There are a great many mining men at Baker City investigating the mining region near here.

Baker City, April 25th, '99.

C. Reed has begun work on placers at Sturgill's bar and expects a big season's run.

It is reported that the Cornucopia mines have been bonded to Spokane capitalists until June 1st. They have forty-five men doing development work.

An expert is examining the Crystal Palace mine near Sparta, owned by Portland parties.

Seven hundred men are working on the railroad or prospecting in the lower end of Pine valley.

SOUTH DAKOTA.

(Special Correspondence).—At the head of Polo creek, three miles west of Deadwood, some discoveries of high-grade gold ore have recently been made. In this vicinity the rocks are chiefly trachyte and rhyolite, in which occur vertical veins which are gold-bearing. In Polo mountain the rocks of the Cambrian are found faulted and intercalated with sheets of intrusive rocks, in which it is probable ore deposits may be found. On the northeast side of this mountain, the basal member of the Cambrian, the conglomerate, is exposed at several places and may be gold-bearing. These conglomerates are the northern extension of the rich deposits in Blacktail and near Central City, the continuity of which is broken northward by faults, of which there are several. There are also several faults in Polo mountain which a cursory examination will discover. Some of the quartzite in this vicinity looks much like that about Terry's peak and it may be found ore-bearing.

Deadwood, April 25th, '99.

UTAH.

A. Murphy, Supt. for Mineral Ranch M. Co. near Milford, reports the walls of the vein 93 feet apart, and that the average contents of the ore, chiefly copper, are such as to insure a good margin. The company owns seventeen claims adjoining those of the Montreal.

Another strike has been made at the Bingham C. & G. M. Co., at Bingham, and ores show 18.2% copper, five ounces silver and $1.80 gold. The vein has been opened 35 feet, with neither wall exposed. The discovery was made at a vertical depth of 41 feet below the surface.

The Sioux mill at Mammoth, which has been silent for months, is to start up again under the direction of F. Peyton, the lessee, who has made arrangements with the Lower Mammoth for handling its milling ores, the delivery of which has commenced.

The Hunt and Riley mines at Mercur are reported sold to Eastern men for $30,000.

The two best known properties owned by the United States M. Co. are the old Telegraph and the old Jordan mines, which are among the oldest mines in Utah, having been worked over a quarter of a century. Their deepest workings are 400 to 500 feet. Before the gold and copper deposits were discovered in these properties a short time ago the mines had to their credit a record of from $40,000,000 to $50,000,000 in silver and lead, all of which went to smelters.

A shepherd on the southern range has written a letter to W. L. Pickard of Salt Lake, accompanying it with samples of what he describes as a fine grade of iron and there is a mountain of it. Mr. Pickard received a certificate from his assayer showing, instead of iron, 44% copper.

Salt Lake *Tribune*: A report from the superintendent of the Old Resolute at Ophir states that the strike in the new workings has developed 10 inches of ore rich in native silver. ——The silver chute underlying the auriferous in the Eagle M. Co.'s property at Mercur has been reached 200 feet west of the bottom of the shaft and 800 feet on the dip of the vein. Assays give thirty-six to sixty ounces silver, with an average of $1 in gold.——T. Kearns of Park City has purchased an interest in the Big Injun group, Lisbon valley, near Moab, and with C. E. Loose will continue development. It is reported the owners will erect a smelter.

Salt Lake *Review*: A steam hoist is to be put on the property of the Sindar M. Co. on the southwest dip of Camp Floyd district.—— A new lead-silver camp is being opened on Cottonwood creek near Peterson in Morgan county. The extent of the ore, which is carbonate, has not been determined. The ore runs 35% to 50% lead, 25% to 30% iron, six to ten ounces silver.

Beaver *Blade*: On Beaver creek, Newton district, the placers contain gold in paying quantities. The black sand carries $50 gold per ton.

Salt Lake *Tribune*: A strike has been made in the Eagle mine at Mercur. Mgr. Mayne says the ore has widened to 4 feet, much of it showing brittle silver and bromo-chlorides, with the real extent of the body yet to be determined. The success of the Eagle in prospecting the silver vein will induce others to drive to it. The point on the dip at which it has been found by the Eagle is the lowest at which it has been encountered in the camp, the apex of the vein being 900 feet above.—— At the Golden Gate mill over 700 tons of gold-bearing ore are being put through the crushers daily, which in a short time will be increased to 1000.

WASHINGTON.

A good strike is reported from the Alice-Eureka at Republic.

Supt. Stewart has uncovered 8 feet of ore on the Stray Horse, at Republic.

Reports from Princess Maud indicate an improvement in the size of the ledge. The values have not changed.

The Gold Finch group of claims, in Republic camp, are to be developed under the direction of J. Hales.

Work has started on the Gallatin at Republic. It is owned by a Spokane company. C. V. Ewell is Supt.

Ore from the bottom of the Mable shaft is reported to assay $60.

The report of a strike in the Morning Glory is confirmed. It is an 18-inch paystreak, clearly defined from the rest of the vein, and lies on the footwall, and between it and the balance of the vein is a horse, separating it from the hanging wall part of the vein.

Republic *Miner*: It is reported that a vein has been opened at Davis Camp, in the south half of the Colville reservation, 26 feet wide, which assays 38 ounces silver, 18% lead and $1.60 in gold.——A 4-foot vein assaying from $8 to $35 per ton has been opened on the Surprise at Republic.——The Mabel at Republic is reported to have 6 feet of $60 ore at the bottom of a 30-foot shaft.

Spokane *Chronicle*: The Morning Glory at Republic, it is reported, has an 18-inch pay streak in the face of the tunnel, in which free gold can be seen. An assay gave a return of $466. This ore body is the richest ever found in Republic. The ore is being sacked for shipment and shipping will begin as soon as the roads will permit.

WYOMING.

H. Yount of Grant has bonded his copper mine on Blue Grass to Cripple Creek men for $15,000. The bond carries a lease of the property and the agreement to develop it.

FOREIGN.

AUSTRALIA.

London *Mining Journal*: It is seventeen years since news was received in Sydney that some important finds of silver and copper ores had been made at Thackaringa, Umberumberka, and Purnamoota. A stampede of miners and prospectors quickly ensued, and further discoveries of gold, silver, lead and copper ores were rapidly made over an area of about 300 square miles; but the greatest attention was given to a bold outcrop of manganiferous gossan at Willyama, at a place known as the Broken Hill, which has since become famous. The deposit since its discovery has yielded minerals valued at more than £25,700,000, the principal figures being: Silver 7,573,531 ounces, valued at £1,336,067; silver-lead ore 1,379,389 tons and silver-lead 363,719 tons, valued at £22,891,434, or, including last year's returns, a total of £25,681,470 worth of raw ores.

BRITISH COLUMBIA.

A 6-foot vein of iron and copper ore has been struck in the shaft in the War Eagle mine at the 750 level which assays $60 in gold.

The Ruth mine in the Slocan is to have a concentrating mill.

The Ivanhoe, P. J. Hickey, Mgr., is reported to have let a contract for a concentrator, and the Wakefield mines will have concentrating machinery.

M. A. Ferguson of Greenwood has a placer on Boundary creek three miles south of Greenwood, and has located three claims. The dirt goes 25 to 50 cents to the yard. A company has been organized in London, capitalized at £10,000, and called the King Fungas Placer M. Co. P. B. Stanhope of Barnsby, Yorkshire, is en route to take charge of the work.

Spokesman-Review: A strike is reported on the Rosey claim, the property of the Cariboo No. 2 G. M. Co. at Camp McKinney. Supt. J. Murphy reports a strike of black sulphurets in Cariboo No. 2.

Spokane *Chronicle*: The shipments from the War Eagle last week reached 1360 tons. The new hoist has not been accepted by the company, but it is being operated more or less. The sinking of the main shaft continues; 15 feet were made during the week. The shaft is now down 749 feet. The ore encountered is of a good grade and in large bodies.

Spokesman-Review: The Ymir mill during the month ending April 10 treated 250 tons, yielding $1500 on the plates and an estimated value in concentrates of $600. There is 20 feet of this character of ore and 8 feet of high-grade ore. Since then forty stamps have been in operation. A contract has been let for hauling the concentrates to the railway.—— The Rossland-Ymir Co. has been incorporated to work the Bruce group one mile from Ymir. The group consists of five claims, the Bruce, Canadian, Simcoe, Colville and Hope. The promoters are J. E. Lane & Co. of Rossland. ——The showing on the Union Jack group is good. This group is seven miles from Ymir and consists of five claims—the Union Jack, Queen, Empress, Horseshoe and Climax. The ledge on the Union Jack is 7 feet wide. A shaft has been sunk 40 feet with a drift 15 feet at the botton, where 4 feet of ore averaging $10 per ton has been cut. On the Queen a ledge outcrops 20 feet wide. A shaft has been sunk in this ledge 20 feet and a tunnel is being driven to tap the shaft. The tunnel is in 90 feet. At the breast ore carrying iron, zinc and galena has been exposed, assaying $29.60 in gold.——The Tracy Creek G. M. Co. is a corporation formed to develop claims in the Tracy Creek camp, Fort Steele district of East Kootenay. The claims are the John L., J. H. C., and Hartwell, all on the Lewis creek side of Tracy mountain. The vein crops from 15 to 40 feet wide through the length of the John L. and J. H. C. claims. In an open cut they have a foot of solid gray copper.

Victoria *Times*: Eight feet of ore is showing in one of the Queen Bess tunnels.——Work was started last week on the Corncracker claim, southeast of Victoria.——A body of ore is reported to have been struck on the Whitewater Deep.——Fifteen tons of ore have been sacked on the Mollie Hughes and a 20-ton shipment is nearly ready. ——At the Tremont group, Four Mile, a tunnel is being driven and is now in 60 feet.——The reported sale of the Mountain Chief has been confirmed.——The Northwest Mining Syndicate has purchased the remaining eighth interest in the Alpha, Alpha Fraction, Lakeview No. 12 and Lakeview Fraction mineral claims, adjoining the Bosun.——The Rambler Cariboo M. Co. will install a five-drill compressor. Mgr. W. H. Adams has returned from Rossland. The company has on the property a boiler, hoist and three steam drills.

CANADA.

Toronto *Mining Gazette*: Toronto is to have the largest blast furnace in Canada. Its capacity will be 200 tons of ore per day.

Rat Portage *Miner*: The average assay of 2000 samples made by the Rat Portage Metallurgical Works was $11.11 per ton.——Work commenced on the Hecla concentrator, Lake of the Woods district, April 5th. The mill will have a capacity of 200 tons per twenty-four hours.——The Lucky Coon mine is in operation again. This mine was one of the first found on the Seine river.

Rat Portage *Miner*: The owners of the Golden Star mine, in the Seine river, Ontario, district, have sold that property to Toronto capitalists for a big consideration. The headquarters of the company will be removed to Toronto.

LOWER CALIFORNIA.

San Diego *Union*: The placer diggings recently discovered at Santa Clara, eighty miles southwest of Calmalli and fifteen miles from the sea coast, are the scenes of activity. All the men in the vicinity of Calmalli are gone to the new diggings, and men are arriving from Santa Rosalia and the copper district on the gulf coast. Several hundred men are reported to be on the ground, and Mexicans are headed in that direction from all over the peninsula. Only a few have returned to Calmalli and brought gold with which to outfit for another trip to the diggings. It is said that the largest nugget found at the Santa Clara placers is worth $85. The most primitive conditions prevail. Besides the idle Mexicans of the lower class, many prominent men of the peninsula are at the camp. Until their return to some place having communication with the outside world, the extent and richness of the new diggings will not be known.

MEXICO.

A rich strike of gold is reported from the State of Guerrero, in the Otallan district. The gold is free milling occurring in iron oxide. The formation in which the veins are found is said to be granite.

Commercial Paragraphs.

THE Colorado Iron Works Co. are putting in a 100-ton plant for the Detroit Reduction Co. at Cripple Creek, Colo., a 10-stamp mill on the property of the Planet-Saturn Co., near Congress, Ariz., and a 50-ton concentration mill for Charles A. Armstrong at Ouray, Colo.

THE Jeanesville Iron Works Co. of Jeanesville, Pa., are building a compound mine pump for one of the large zinc mines in the Joplin, Mo., district, capacity 1500 gallons a minute. It will be the largest steam mine pump in that district. They are also building a 23-inch and 38x14x48-inch compound pump for the Lawrence Coal Co. of Pennsylvania.

BAILEY & MONNIG of the State Ore Sampling Co., Denver, Colo., are handling 4000 tons of ore per month, which comes in the main from various Colorado districts and from Idaho and Montana. In addition to this they handle considerable quantities of uranium and wolframite. The black oxide of uranium they get comes mainly from Gilpin county, Colo., and the yellow oxide from Paradox valley. The tungstic acid in wolframite gives it its market value.

THE Thornton N. Motley Co. of No. 43 John street, New York City, have just completed a contract with the Jackson Drill & Mfg. Co. of Denver, Colo., whereby they become the sole licensees for the sale and manufacture of the Jackson hand-power rock drill throughout the Eastern United States and all foreign countries. That they have taken hold of the matter in a very energetic manner is evidenced by the fact that they have ordered quite a number of drills from the factory at Denver for the purpose of exporting, twenty-five of the machines being for Mexico alone.

Books Received.

"*Liquid Air*," by T. O'Conor Sloane, 368 pp.; an interesting volume, illustrated, giving the history and theory of the subject of the liquefaction of gases. It gives many experiments and shows how liquid air, like water, may be carried hundreds of miles and handled in open buckets. The book, while scientific, is written in popular style and may be read and understood by anyone. Norman W. Henley & Co., 132 Nassau street, New York City; price $2.50, postpaid.

Personal.

NICHOLAS TREWEEK of Salt Lake, Utah, is in Boston.

PH. DEIDESHEIMER has been examining the Texas mine at Nevada City, Cal.

W. E. RENSHAW is Mgr. of the Newton and Silver Age mills at Idado Springs, Colo.

A. N. BUTTS of Angels, Cal., has gone to Plumas Co., Cal., to develop mines at Nelson Point.

E. H. BENJAMIN has gone to Tuolumne Co. to investigate the Junction mine near Souls. byville.

CAPT. J. R. DELAMAR has returned to Mercur, Utah, after an absence of several months abroad.

W. H. WRIGHT, Supt. Oceanic quicksilver mine in San Luis Obispo Co., Cal., is in San Francisco.

LEO VON ROSENBERG has returned to San Francisco, Cal., from Arizona and has gone to New York.

W. BERNSTEIN, Gen. Mgr. of the Ibarra gold mines at Calmalli, Lower California, is in San Diego, Cal.

CAPT. JAMES of the Robinson mine, Johannesburg, S. A., returns to California next month on a vacation.

W. G. DODD of the Union Iron Works, San Francisco, Cal., leaves for China on the 16th inst. on mining business.

FRED W. WHITTEN, for years Supt. for Towle Bros., has accepted a position as Supt. Gold Run M. Co.'s mines, near Gold Run.

W. J. ADAMS, E. M., has arrived at Lituya bay, Alaska, where are located the gold-bearing beaches of the company he represents.

EX-SENATOR STEPHEN M. WHITE, Pres. of the southern California branch of California State Miners' Association, is in San Francisco, Cal.

EDWARD TWICKER, former Supt. of the Baisley-Elkhorn mine, Baker City, Oregon, was recently in Colorado and has gone to Mexico.

F. VON LEICHT, M. E., has returned to San Francisco, Cal., from an inspection of the Oceanic quicksilver mine near Cambria, San Luis Obispo Co., Cal.

SAMUEL H. DOTY, a civil engineer, for the past two years at the Louisiana mine, near Coulterville, was one of a party of four timber locators who perished on the trail near Astoria, Or., during April. The cause of their deaths is a mystery.

GEO. W. PEIRCE of the Golden Fleece mine at Lake City, was in Idaho Springs a few days making tests of Golden Fleece ore at the mills there. He states that the new 60-ton concentration mill for the Golden Fleece will be commenced in May.

EMILE R. ABADIE, mining engineer, has severed his connection with the Grand Central M. Co. of Minas Prietas, Sonora, Mex. Mr. Abadie's management of the property for the past two years has been successful, the mine having paid regular dividends, showing a good record for a 30-stamp mill. Mr. Abadie is on his way to San Francisco en route to London.

Industrial Notes.

—Stockton, Utah, is to have electric lights and electrical power to operate its mining machinery. Mgr. Lamson of the plant at Jordan Narrows has decided this and in a few days will make definite arrangements for the extension of wires into that camp.

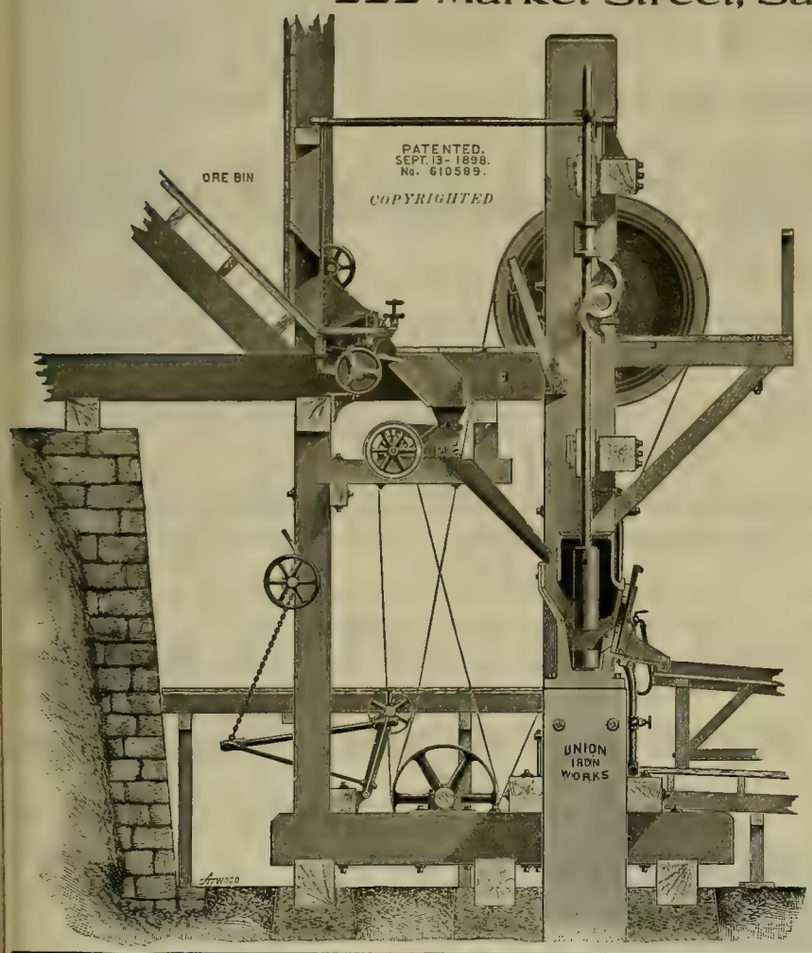
—The report that a company has been formed with $15,000,000 capital to build a steel plant at Buffalo is confirmed. The plant will have an output of 800,000 to 1,000,000 tons of steel annually. Buffalo capitalists are said to have subscribed $2,500,000 for the enterprise.

—The Star & Crescent furnace at Rusk, Texas, went into blast recently. This furnace is owned by New Orleans people. Mr. Leach of New Orleans has the furnace, ore land, etc., leased. The furnace has a fifty-ton capacity; it has been built eight years, but has been idle for the most of the time since it was completed. The fuel used is charcoal.

—Describing the Southern California Electric Power Co.'s plant, E. E. Fowler, master mechanic of the Los Angeles, Cal., Railroad Co., shows that in this, the longest electric power transmission line in the world, water power is developed from mountain streams east of San Bernardino, and drives impulse wheels under a head of over 700 feet. These are directly connected to three-phase alternating current generators, which deliver current at 750 volts to air-cooled transformers which are arranged to raise the potential to 33,000 volts. The present capacity of the station is 4000 H. P., but this can be increased to 6000 H. P. or more when the demand warrants the installation of additional machinery. The transmission from the power station to Los Angeles, a distance of a little over eighty miles, is over six No. 1 copper wires (about 9.32 inch diameter) as to what loss in current occurs in this long line transmission and in the entire plant from the water applied to the wheels to the final application of the current for light or power in Los Angeles, the conclusion is arrived at that the electrical current finally delivered to the consumer in Los Angeles represents about 45% of the power originally available in the water at the power station.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

JOSHUA HENDY MACHINE WORKS,

Principal Office: NO. 42 FREMONT STREET. - - - Works: Corners Bay, Kearny and Francisco Streets, SAN FRANCISCO, CAL.

SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

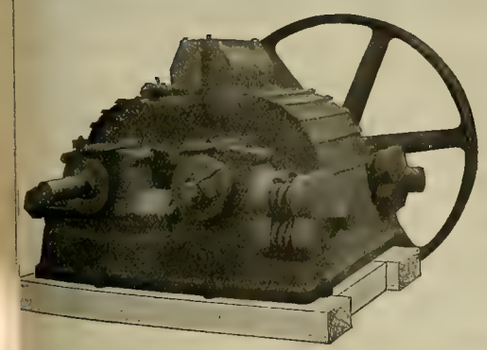
NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

CATES IRON WORKS.

HIGH GRADE CRUSHING ROLLS.



In competition with the best the world can offer, we have secured and shipped an order for nine sets of these Rolls (36″x16″) to the Broken Hill Proprietary Mines, New So. Wales. Weight of each set, 33,000 lbs. They are built with all the care given a modern engine.

Builders of Rock and Ore Crushing Machinery.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

30,618.—DESIGN, TOOL HEAD—J. Herfert, Tucker, Wash.
30,609.—DESIGN, HOOK—W. P. Murphy, Willow Glen, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REVERSIBLE GANG PLOW.—Thomas E. Kavanagh, Vallejo, Cal. No. 623,673. Dated April 25, 1899. This invention relates to gang plows and a means for reversing the position of the plows so that they can be used on hillsides, or wherever it is desired to throw the funnels in the same direction. It consists of a single beam having plow standards journaled vertically with relation to it, plows fixed to the lower parts of the standards and turnable with them so as to make either a right or a left-hand furrow, and a supplemental triangular frame having its rear apex pivoted to the plow beam and the base or front movable transversely with relation thereto, so that one side of the frame is brought approximately into line with the plow beam, extending diagonally with the line of travel, and the other essentially in the line of travel with the plow. Suitable mechanism is arranged to provide for these movements to bring the frames alternately into position. The shares of the plows are double-pointed so that when the positions are changed one share will throw the furrow in one direction and the other share in the opposite direction.

CENTRIFUGAL MERRY-GO-ROUND.—J. C. Holloway, San Francisco, Cal. No. 623,667. Dated April 25, 1899. This invention relates to that class of amusement devices known as "merry-go-rounds." It consists of a stationary support with a central vertical journal shaft, with means for applying power to rotate it, a framework carried by the upper end of the shaft, suspending arms pivoted to the periphery of the framework having cars or seats pivotally attached to the lower ends of the arms, so that they will swing outward and upward by centrifugal action when the apparatus is in motion. In conjunction with these are check ropes or stays connecting respectively with the cars and with the framework at points interior to the fulcrum points of the arms so that the relative position of the cars may be regulated and maintained. Devices are also connected with the apparatus to produce a rising and falling movement of the cars while they revolve by variation in the speed of rotation. The cars may thus be maintained in an essentially vertical position while revolving, and considerable changes in movement may be made during the operation.

BOTTLE.—William Wilson, Oakland, Cal. No. 623,644. Dated April 25, 1899. This invention relates to improvements in bottles of that class in which a device is employed to prevent the fraudulent refilling of the bottle after the contents have been emptied. The bottle has an annulus fixed within the neck and superposed fine screens secured to the annulus. There is a hollow stopper exterior to the screens and a sleeve surrounding the bottle neck having the outer end closed and adapted to seat upon the hollow stopper. By means of a spiral groove and pin the sleeve is turnable to move it outward along the neck of the bottle, and it has also a discharge passage made in the side interior to the closed end with a screen in the passage. An air passage is provided upon the opposite side from the sleeve with a valve or diaphragm which will close the openings of the passage when it is attempted to introduce liquid therethrough.

RAILROAD SIGNALS.—John Jorgenson, San Francisco, Cal. Nos. 623,671 and 623,672. Dated April 25, 1899. These patents relate to signaling devices which are employed in connection with railways for the purpose of signaling the approach of trains on main lines, or single cars on street railways. The invention comprises signals which may be either lights at night or colored signals during the day, and with these are opaque or concealing cases so depressed with relation to the signals and colored globes that the signals may be withdrawn into or covered by the concealing cases when not in use, and exposed when they are to be used. In connection with these signals are electrically or mechanically actuated devices which are so connected with the track that the passage of a car or train will, at a certain distance from the signal, act to expose it so as to give warning of the approach, and after the car or train has passed the point of danger, it operates another device by which the signal is again concealed.

DESIGN FOR HOOK.—Wm. P. Murphy, Willowglen, Cal. No. 30,609. Dated April 25, 1899. This invention relates to an improvement in hooks such as are used for hanging clothes and other articles. It consists in making the hook of a single piece of wire so curved as to form the necessary wall attachment, and to produce a plurality of upturned points for the hanging of such articles as may be desired.

Wanted—Large Huntington or Bryan Mill.
Must be in good condition. Also 1000 feet of 12-lb. T rails. State full particulars and lowest cash price. Address A. R., Mining and Scientific Press.

WANTED—2000 FEET 4-INCH WROUGHT IRON PIPE.
Must be in good condition.
Address DYER BROS., 119 Beale St., San Francisco, Cal.

WANTED.
Competent Diamond Drill Man
WHO CAN SET HIS OWN BITS.
Apply, stating experience, references, etc., to MOUNTAIN COPPER CO., Keswick, Cal.

WANTED
By a Practical Mining Man,
A GOLD, SILVER OR LEAD PROSPECT ON WORKING BOND.
Must have ore shoot in sight. Vein must be of moderate size and shoot of moderate length.
Address VIRGINIA CITY, care of Mining and Scientific Press.

WANTED.
A First-Class Mine Foreman for Development Work in the Northwest.
Must be a good all-round miner in shaft sinking, timbering, tool sharpening, handling men, and strictly sober. Young or middle-aged man preferred. Give experience, references, pay wanted and full particulars. Address ROX, care Mining and Scientific Press.

Group of Gold and Silver Mines for Sale.
For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.
For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

Mining Properties,
Prospects and Partially Developed Claims at Low Figures, Near Good Ore Market.
Also a 50-foot ledge, developed. Ore runs $4 and upwards; free milling. Can be quarried. Water right accompanies.
J. N. ROSA, P. O. Box 5, Shasta, Cal.

DIAMOND DRILL FOR SALE,
OR CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE IT.
Apply to J. A. MURRAY, care of Risdon Iron Works, San Francisco.

..CRIPPLE : CREEK..
FOR SALE—CYANIDE PLANT,
100 tons daily capacity; in first-class condition to handle Cripple Creek ores.
Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

Quicksilver
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

HEALD'S
BUSINESS COLLEGE.
24 Post Street, - - - San Francisco.
MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.
ELECTRICAL DEPARTMENT: Theory and Practice; Construction.
BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.
Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

DOBLE ROCK DRILLS AIR —AND— COMPRESSORS.

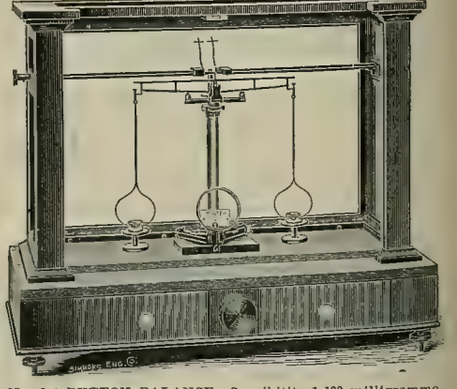
Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to



No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

SAN FRANCISCO, CAL.

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

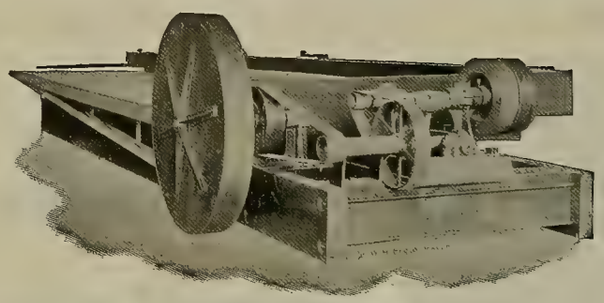
WHITE, ROGERS & CO.,
Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

THE
"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

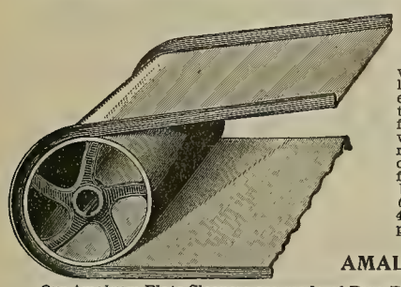
ADAM SCHILLING & SONS, 211 & 213 MAIN STREET, SAN FRANCISCO, CAL.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

Market Reports.

SAN FRANCISCO, May 4, 1899.

SILVER.—London, 28⅜d; New York, 61⅞; San Francisco, 61; Mexican Dollars, 48½. New York exchange, sight, 5; telegraphic, 7½ cents premium.

LEAD.—New York reports steady, $4.37½ bid, $4.42½ asked; brokers' price, $4.10.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 7c; bar, 7¼c.

COPPER.—New York reports Lake firm at $19.25; brokers' price, $19@19.12½.

The market price of copper continues to go higher and has nearly reached the 20c mark set some weeks ago. As the situation now appears it will not be a surprise to see it reach several points above 20 cents in the very near future. The demand still continues and the output has not yet shown that it can keep pace with the increasing demand.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12½@13c per pound.

TIN.—Pig, 31c per lb.; Bar, 35c. New York reports firmer, $25.30 bid, $25.40 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $42; export, $38.50; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

RED LEAD AND LITHARGE.—One ton and over, at one purchase, 6¼c; 500 lbs. and less than one ton, 6½c; less than 500 lbs., 7c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15¼c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd.	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 32 @ 33c per lb.; carloads, 30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7½c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

Assessment Notices.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1899, an assessment (No. 13) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the fourteenth day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of April, 1899, an assessment (No. 24) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 29th day of May, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

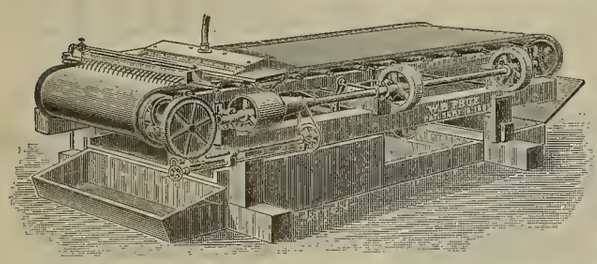
FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation.

Gives THREE CONCENTRATES on the one Machine at the same operation.

The Machine is especially adapted to the separation of Zinc and Lead.

SIZE OF MACHINE.....4 ft. by 8 ft.

WEIGHT.....1000 Lbs.

CAPACITY.....10 to 30 tons per 24 hours.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

THREE CLASSES OF MACHINES ARE MADE.

Table A is adapted to concentration from 2 into 1 to 8 into 1.
Table B, 6 into 1 to 16 into 1.
Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs. or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

Price of the Table $300 Complete, f. o. b. Cars, San Francisco, Cal.

Hydraulic Mining in Northern California.

Among the largest and most successful hydraulic mines operating in California are those of Trinity county. The mines there work without restriction, the streams of the region not being tributary to the Sacramento river and being unnavigable throughout their length. The scenes depicted on this page are typical of hydraulic mining, not only in Trinity county, but elsewhere in California, where this class of mining has reached the highest development, and is carried on either without restraint or under the conditions of permits issued by the United States Debris Commission.

Originally the mines of Trinity were operated in a small way by the owners, who, having limited means, were unable to work to the best advantage; but capital was introduced from abroad, and there are now in that section some of the largest hydraulic mining operations in the State. In Trinity county a great many of the gravel deposits occupy bars or terraces along the hillsides of the streams, and are evidently the remnants of the channels of these streams at an earlier period, and in this respect are somewhat unlike the ancient river channels found farther south in the State.

Hydraulicking is a very interesting as well as a very profitable business in California, and had this great industry not been inhibited for years and later required to work under certain restrictions, doubtless radical changes would have taken place in methods and appliances and it can only be surmised to what extent operations might have advanced.

The Act repealing all local mining laws passed at the last session of the California Legislature took effect immediately upon its passage, and those who have located claims since the passage of that Act in conformity with the old Act of '97, which was repealed, should take steps to relocate under the Federal statutes, it appearing that some litigation has already resulted from the change. It is a well-known axiom that ignorance of the law is not an excuse, and those who have proceeded under the old law, not knowing of the passage of the new, would have a poor case in the event of litigation.

As to the future of copper there is a diversity of opinion. A prominent electrical engineer says that, in his opinion, the future of copper largely depends upon the uses to be made of electricity. He believes that a period of fifteen years will have seen all other means of locomotion and power supplanted by electricity, and the future of copper in consequence is plain. Doubtless copper will continue to be a very important factor in the electrical world, but the necessities of the case will demand naturally that copper shall be used in as small quantities as possible, and there will undoubtedly be an endeavor to reduce the weight of wire employed to conduct electric currents to the smallest practicable dimensions, as well as to find a cheaper and satisfactory substitute for copper. The large number of new prospects and old mines being reopened have, with few exceptions, not commenced production of metallic copper as yet, but in a few months, if the price of the metal remains at its present high figure, or near it, a great many of these new concerns will add their quota to the general output, which will be swelled beyond that of any period of the past.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Chapman & Fisher mine, near Junction City, Trinity County, Cal.; Monitor and Derrick, Chapman & Fisher Mine, Trinity County, Cal.; Giants at Work, I a Grange Mine, Trinity County, Cal.; Hydraulic Pit of Red Hill Mine, Junction City, Trinity County, Cal., 505. Miocene Gravel Mine, Cariboo, B. C., 509. Latest Mining and Metallurgical Patents, 510.

EDITORIAL.—Hydraulic Mining in Northern California; Repealing Local Mining Laws; The Future of Copper, 505. Gases in Blast Furnaces; Eight Hours Work at Leadville; Removal of Office; The Copper Mining Industry; The Miners' Union at Idaho; Reorganizing Mining Districts; Tuolumne County Mining District; Another Important Mining Decision by Judge Hallett; Gold near Cape Nome; "Jumped" the Townsite of Keswick; Stock of Amalgamated Copper Co.; Second Elevator at the C. & C. Shaft, 506.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 513-514.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 526.

MISCELLANEOUS.—Concentrates; Auriferous Zones in the Hanging Wall of the Mother Lode of California, 507. The Diamond Drill in Prospecting; Mining Industry in Mexico; Some Experiences of a Working Miner, 508. Increase in Price of Zinc Bringing American Zinc Properties into Prominence; The Miocene Gravel Mine of Cariboo, B. C.; Aluminum in England; Tungsten and Its Uses; The Anaconda Copper M. Co.; One of the Greatest in the World; Value of Wireless Telegraphy, 509. Latest Mining and Metallurgical Patents; Blue Asbestos; New Gold Discovery, 510. Railroads in China; The Sources of Atmospheric Electricity; Massachusetts Institute of Technology; The Situation at Wardner; Thawing Frozen Ground; Industrial Notes; Personal; Recent Mining Incorporations; Commercial Paragraphs; Books Received; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 511. The Grand Canyon of the Colorado as a Mining Field; New Carbide Plant; Aluminum as a Medium of Electrical Transmission; Barbed Wire Telephone; Liquid Air; Transmission of Power for Underground Pumping, 512. Recently Declared Mining Dividends, 526.

THE gases generated in blast furnaces are being utilized in Europe for running gas engines with complete success.

NEARLY 50% of the miners at Leadville now work but eight hours, but the mine managers demand the best men they can employ. The wages paid are $3 per day.

THE offices of the American Institute of Mining Engineers, which for years have been at 13 Burling slip, New York City, have been moved to 99 John street, corner of Cliff, in New York.

MORE money is being invested in the copper mining industry this year than in any half dozen previous years. Zinc also is attracting a large amount of attention, it, like copper, having risen in price to a point which makes it an object of unusual interest.

THE recent lawless acts of the Miners' Union in Idaho, at the Bunker Hill & Sullivan mine, cannot fail to have a depressing influence on the investment of capital in that State for a time. The authorities, both State and Federal, have taken a firm stand, however, and there is little probability of the recurrence of such a scene as was enacted at Wardner on the 30th ult.

THE Eastern financial journals state that when the $75,000,000 stock of the Amalgamated Copper Co. was offered on the market more than $400,000,000 was offered. The stock is now changing hands at a premium, ranging from 103 to 110. This simply means that the subscribers to the stock are not only willing, but anxious, to buy into a pool controlling some of the largest copper mines, paying for the privilege at a higher valuation than has ever before been placed on the mines. The present capitalization is for $75,000,000, with the privilege of increasing this capitalization indefinitely.

TWO VENTURESOME PROSPECTORS "jumped" the townsite of Keswick a few days since ostensibly for mining claims. It is asserted that the property in question was originally located as a mining claim, and patent applied for, the applicant having the receipt of the receiver of the Land Office for money paid into the United States treasury. When an applicant for a patent has the receiver's receipt, it is equivalent to a patent, and in this case the jumpers will have a poor case in court. They base their claim, it is reported, on the fact that assessment work has not been kept up as required by law on unpatented claims.

Another Important Mining Decision by Judge Hallett.

The following is the full text of a decision in the case of Cone vs. Roxana Gold Mining & Tunnel Company, at Cripple Creek, Colo., and is the most recent of Judge Hallett's notable decisions:

By Judge Hallett (orally).

James J. Cone and Lyman Robinson against the Roxana Gold Mining & Tunnel Co. is a bill for injunction.

Complainants have patent title to two claims in the Cripple Creek mining district, parallel and adjacent, which are called Doctor and Chief. They were located in the months of August and September, 1891.

Respondent owns the Gold Standard tunnel, which was located by Eli G. Bettis in the month of March, 1892. Respondent has driven his tunnel through and across the Doctor claim, and is now about to enter the Chief claim in the further prosecution of its work. It is averred in the bill that the purpose of respondent in driving the tunnel is to take ore from the Doctor and Chief claims and to make locations in those claims; but this is denied in the answer. Respondent says that no ore has been discovered in the tunnel, and none will be taken from the complainant's territory under any circumstances. It seems only a right of way for its tunnel through and across the Doctor and Chief claims, with a view to develop property owned by it further on in the course of the tunnel.

The case is not the same as Stratton vs. Gold Sovereign Co., 1 Legal Adviser, 350, in that the respondents in that case were attempting to take ore from complainant's location. It must be said, however, that the principle upon which that case was decided is applicable to any entry upon the premises of another without right, or for a purpose not recognized in the law. If, as was said in the Stratton case, complainants are the owners of the Doctor and Chief claims, as against a junior location of a tunnel site, respondent must justify its invasion of these claims whatever the object of its entry may be.

Accordingly an early statute of 1861 (Sec. 3141 of Mills' statutes) and a recent Act of 1897 (11th session 181) are cited in support of respondent's right to prosecute the work. These Acts are in nearly the same terms, and the latter declares that a tunnel owner "shall have the right to drive and continue the same through and across any located or patented claims in front of the mouth of such tunnel." No provision is made in either Act for ascertaining the need of the tunnel owner for right of way through the serviant estate in order to work his own claim beneficially or for compensating the damage done to the estate appropriated to the use of the tunnel.

In the absence of such provisions the Acts would seem to be in conflict with Secs. 14 and 15, Art. 2 of the Constitution of the State. Sec. 14 declares that private property shall not be taken for private use except for certain purposes and Sec. 15 declares that it shall not be taken without just compensation to the owner.

Respondent's counsel believes that the Acts of Assembly are supported by Sec. 2338 of the Revised Statutes of the United States, which is incorporated in complainant's patent. He maintains that complainant's estate in the Doctor and Chief claims is subservient to all local legislation, regulating the use of the claims by the owners thereof, and by others who may own property in the vicinity. In this, however, he is not supported by the course of judicial opinion when the statute has come under the observation of the courts. In a general way, it has been understood that the Act was intended to signify the assent of Congress to those wholesome regulations which have been found necessary in the business of mining to insure the safety of workmen and a proper course of administration in conducting the business. Woodruff vs. North Bloomfield Gravel M. Co., 18 Fed. Rep. 753; People vs. District Court, 11 Colo. 148; Amador Queen M. Co. vs. Dewitt, 73 Cal. 482.

It is reasonably clear that the statute refers only to such rules and regulations as may be made before the Government has conveyed its title; because it says, "In the absence of necessary legislation by Congress" rules may be made; and Congress would have no power to legislate after the Government has conveyed its title. The last clause of the section provides that the conditions of sale "shall be fully expressed in the patent," and this may mean that only such things as are particularly described are reserved from the grant. The right to follow a vein from adjacent territory is usually so described in the patent.

It is not necessary to consider at length the meaning of the section. It is enough that we are enabled to say that it cannot displace the Constitution of the State, and the case cited from 11 Colo. supports that conclusion. The Legislative Assembly of the State of Colorado has attempted to give to tunnel owners a right of way under ground through locations properly made, of earlier date than the tunnel site, without compensation to such owners. An Act of that kind is of no force or effect under the Constitution of the State, and respondent will not be able to justify its entry upon complainant's property under its provisions.

Objection is also made to the bill, on the ground that it discloses nothing more than a trespass which cannot be a subject for relief in equity; and that the damages suffered by complainants from the completion of the tunnel cannot amount to $2000.

We have often held that a naked trespass will not be restrained when nothing of value can be taken from the property; and if respondent's work in the property in controversy appeared to be of that character the writ would be refused. There is, however, something more than a trespass involved in the case. Respondent seeks to establish a right of way for its tunnel in the premises, and the tunnel when completed may be used for all time. Whether this is an injury to complainants' property exceeding $2000, we are unable to ascertain on this motion. A matter of that kind can be better considered at the final hearing upon full testimony taken in the usual way.

The injunction will be allowed according to the prayer of the bill.

March 31st, 1899.

THE recent discovery of gold near Cape Nome, in Alaska, throws some interesting light on the distribution of gold in that Arctic region. At the time the Klondike first gained prominence as a mining field of great possibilities, it was thought that the gold fields would extend northerly or in a northwesterly direction. Looking at a map of British Columbia, Northwest Territory and Alaska, some very interesting facts are observable. The mineral belt extending northward from California, Oregon, Washington, Idaho and Montana passes in a northwesterly direction into and through British Columbia toward the Northwest Territory; but it is noticeable that, as it passes northward, it bends constantly to the westward, passing through Cariboo, Cassiar and on to the Klondike region, where its trend is well to the westward. Still westward, it passes through the Circle City region, beyond which it appears to strike nearly due west toward Cape Nome. It should be remembered that there are numerous gold discoveries lying outside of the belt described, but thus far none of them have proved important, unless the Atlin lake country be excepted, and that is as yet undeveloped. These facts are of interest, but Alaska is as yet too superficially developed and too little known to make it safe to lay down arbitrary lines. To the northwestward of Klondike, where it was formerly presumed the gold belt would be found to extend, very little gold has been found. I. C. Russell, for the United States Geological Survey, made an investigation of considerable territory in that region and does not report having observed gold anywhere. The development of the newly-found field will be watched with unusual interest.

THE miners of Tuolumne county, at a convention held recently at Sonora, reorganized the Tuolumne mining district. Among other rules and regulations of the district, is one requiring that the locator of a mining claim within the district shall post a notice at each end of his claim at the center stake. The United States statutes require a notice to be posted at the point of discovery as well, so that locators in the district of Tuolumne will be required to post three notices. Another section of the rules requires that a locator file his location notice for record with the district recorder within thirty days of the date of location, or the claim shall be regarded as abandoned and shall be open to location by another.

THE miners in various parts of California are reorganizing mining districts for the purpose of providing local rules and regulations to govern the location and development of claims. Unless some step be taken at once by the Executive Committee of the California State Miners' Association to issue a uniform location blank, as previously suggested, it will soon be too late to hope for anything like uniformity, as each district will adopt a form of its own.

THE second hydraulic elevator at the C. & C. shaft of the Comstock lode has been placed in position and was ready to start Thursday evening. At that time the water in the 1750 level winze was 41 feet 8 inches below the station level. The first elevator was working steadily and holding the water. The progress of this work is watched with great interest by mining men everywhere.

Concentrates.

CENTIMETERS multiplied by .3937 equal inches.

LITERS multiplied by 61.022 equal cubic inches.

ONE cubic inch of water weighs 0.036118 pound.

CUBIC METERS multiplied by 35.315 equal cubic feet.

CUBIC CENTIMETERS divided by 16.383 equal cubic inches.

ONE pound pressure per square inch equals 2.3091 feet head.

THE French millimeter multiplied by the decimal fraction .03937 equals 1 inch.

MELACONITE is a black earthy oxide of copper; not uncommon in copper regions.

THE new gold discoveries at Nome, in Alaska, are within 150 miles of the Arctic circle.

A METER is equal to 39.37 inches. Meters may be reduced to feet by multiplying by 3.281.

THE density of water is greatest at 39° F., at which density one cubic centimeter weighs one gramme.

THE Minister of Mines of British Columbia classes the ores of Rossland as gold and those of Nelson as copper-silver ores.

EMBOLITE is a chloro-bromide of silver, resembling bragyrite (horn silver). Its color is yellowish green. It contains 51% silver.

WATER is composed of two volumes of hydrogen and one of oxygen (H_2O). By weight, one part of hydrogen and eight parts of oxygen.

THE present price of sheet copper for amalgamating plates at San Francisco is 23½ cents per pound, but the price is changing almost daily.

CHALCOPYRITE is copper pyrite, and is sometimes called yellow copper ore. It is a sulphide of copper and iron containing copper 34.5%, sulphur 35% and iron 30.5%.

METACINNABARITE, which occurs in several California quicksilver mines, has the same composition as cinnabar, but differs in crystallization. It has a brownish, iron-black color.

THE variety of mica called hydrous-mica, which forms an important constituent of some schists, has been found on careful investigation to contain little if any more water than other ordinary muscovite micas.

GALENA requires 4.34 cubic feet to make a ton of 2000 pounds. Pyrite (iron sulphide) requires 6.41 cubic feet to make a ton. A ton of limestone contains 11.50 cubic feet. Granite requires 11.77 cubic feet to weigh one ton.

PUMICE is a porous, vesicular, volcanic glass, the cavities vesicles being usually elongated. It varies considerably in chemical composition. It occurs on the surface of obsidian streams, and is really a frothy condition of the obsidian itself.

SEA WATER contains 3.5% of salts, of which 2.7% is chloride of sodium (common salt) and the balance sundry other salts. It is also said to contain a small amount of gold per ton, all effort to recover which has up to the present time proved abortive.

BORAX and boracic acid have been made at various times for some years past at Calico by prospectors owning claims there. This borax was not manufactured from colemanite, but from a clay shale containing a large amount of calcium borate in fine crystals.

MANGANESE ORE (pyrolusite containing 60% to 65% black oxide manganese) is salable in San Francisco at $8.50 to $9 per ton. It sells retail when ground for use at about $20 per ton. It is used chiefly in California in the manufacture of chlorine gas at the various chlorination works.

THE statement has been published that fluorspar occurs in the United States only in Crittenden Co., Kentucky, and Hardin Co., Illinois. Fluorspar occurs in abundance at Bastie Dome, Arizona, in more limited quantity in other portions of Arizona, and in Los Angeles Co., Cal., near Glendora.

EXPERIMENTS are being made with various kinds of wood other than pine for mining purposes. Redwood, while not as strong as pine, is more durable, and acacia is also said to give satisfactory results. The New Almaden quicksilver mine, in Santa Clara county, Cal., is timbered largely with redwood.

BORNITE is purple copper ore, variegated copper ore, also called peacock copper, a copper-iron sulphide in which the proportions of the elements vary, copper usually about 55%. Chalcopyrite also shows the iridescent colors peculiar to bornite, but is due to tarnish, and is not peacock ore.

WHEN the total amount of assessment work required by law ($500) to secure patent to a mining claim has been performed, and application for patent has been made and received and a receipt issued to the claim holder, the law does not require that he shall do any further assessment work on the property.

AZURITE is the blue carbonate of copper containing carbon dioxide 25.6%, cupric oxide 69.2%, water 5.2%. It is very similar to malachite, but contains less copper; is of a beautiful dark blue color. Both malachite and azurite effervesce with acids. Linarite is a deep blue mineral greatly resembling azurite. It is a basic sulphate of lead and copper.

TO MEASURE a stream by velocity and cross-section measure the depth of the water at 6 to 12 points across the stream at equal distances. Add all these depths together and divide by the number of measurements made to find the average depth. Multiply this by the velocity of the stream per minute, which gives the number of cubic feet flowing per minute.

ALABANDITE is a sulphide of manganese. It has a iron black color and sub-metallic luster, with a dirty green-ish streak. It is not a common mineral. Two important localities are Summit county, Colorado, and near Tombstone, Arizona. It is often accompanied by rhodochrosite (manganese carbonate), and sometimes, also, by rhodonite (manganese silicate).

CHRYSOCOLLA is a silicate of copper, of bluish green color. The luster is sometimes shiny to vitreous, and sometimes earthy; occurs filling cracks and seams and often as a coating on rocks in copper regions, also in masses, constituting a valuable ore of copper; is decomposed by acids, but does not effervesce like the carbonates. It is infusible before the blowpipe.

TETRAHEDRITE (gray copper) occurs crystallized, granular, and massive; the color and luster often splendent, between flint gray and iron black, sometimes slightly brown or red; a combination of copper 52.1%, antimony 24.8% and sulphur 23.1%. It graduates into other varieties containing silver and gold. It is commonly associated with copper and zinc ores in many districts.

IN the issue of the 29th ult. in "Concentrates" appeared the statement that the Homestake, South Dakota, mine occurred in granite. This was an error. The formation inclosing the Homestake mine and forming a portion of the pay shoots is mica schist of fine texture. Associated with the great ore deposits are intrusive masses of felsite, which is near granite in composition.

THE lead-silver mines of Resting Springs and other localities in Inyo county, Cal., were worked to some extent about '70, the ore being hauled more than 250 miles by teams across the desert to San Bernardino and thence to San Pedro, from which port it was shipped. Smelters were also built at some of the mines, but the high price of fuel and other supplies made the business unprofitable.

MALACHITE (green carbonate of copper) is of a beautiful bright green color, brittle but soft. The fibrous varieties have a silky luster, the more massive dull and earthy; contains carbon dioxide 19.9, cupric oxide 71.9. This is one of the most common of copper ores and is often seen staining and incrusting rocks on the surface in copper regions. It also forms large veins and masses of great value in mines.

AT works recently erected near Daggett for the treatment of rock containing calcium borate, obtained from mines in the vicinity, it is stated that the rock is first crushed, then roasted. It is then pulverized dry and boiled in chemicals. The solution being run into settling vats, the impurities settle to the bottom, after which the vat is decanted, allowing the borate solution to run into the crystallizing vats.

SERPENTINE is a hydrous-magnesium silicate, like talc, but containing more water and less silica. Chrysotile is fibrous serpentine. The latter often occurs as veins in massive serpentine, the fibers lying transversely in the vein. Chrysolite (olivine) is evidently an important original constituent of the rocks from which serpentine is formed. Peridotite, consisting largely of chrysolite, is often found altered into serpentine.

THE quantity of heat required to raise the temperature of one gramme of water for 1° centigrade is called one calorie. It takes as much heat (calories) to melt one gramme of ice as it takes to raise the temperature of seventy-nine grammes of water 1° C., or to raise the temperature of one gramme of water 79° C. It requires 536.5 calories to change one gramme of water of the temperature of 100° C. into steam having the same temperature.

CUPRITE is red oxide of copper. When crystallized it is found most commonly in octahedrons, though also in cubes and dodecahedrons much modified in form. It is massive and earthy. The luster is adamantine or sub-metallic to earthy; color red of various shades, particularly bright crimson, sometimes nearly black. It may be distinguished from iron oxide by inferior hardness, though harder than cinnabar. Contains copper 88.8%.

DANAITE, the rare cobalt-bearing sulpharsenide, is found in the Pine Tree-Josephine mine in Mariposa county, Cal., accompanied by a pink efflorescence, erythrite (cobalt bloom), a hydrous cobalt arsenate, which is a secondary product due to oxidation of the danaite. The mineral is gold-bearing. Erythrite also occurs in the Kelsy and Mint silver mines in the San Gabriel canyon in Los Angeles county, Cal., associated with native silver in a gangue of baryta.

THERE are no extralateral rights to the mineral deposits of the Leadville, Colo., district. In each instance the juries who tried the numerous cases where companies undertook to claim extralateral rights found that there was no vein or lode. This was an unwritten law of the district. The deposits, while being lodes or veins within the definition of the court, they were not such, in fact, when left to the determination of local juries, and, as a consequence, no extralateral rights were obtainable.

THE right to the use of running water flowing in a river or stream down a canyon or ravine in California may be acquired by appropriation; but the appropriation must be for some useful purpose, and when the appropriator or his successor in interest ceases to use it for such purpose, the right ceases. The place of diversion of such water may be changed, if no person is injured by such change, and the water may be conveyed in pipes, flumes, ditches or otherwise beyond the place where it was first used.

NO MINING CLAIM can be legally taken which does not include within its boundaries the apex or top of a discovered vein. This is the theory of the law, but a condition may exist, as at Leadville, where an ore deposit may pass entirely through a claim lying at a low angle and not have an apex within the vertical planes drawn downward through the boundary lines. The deposit may have its apex in an adjoining claim or in some other claim in the neighborhood. A shaft sunk from the surface and reaching a flat ore deposit of this description constitutes a legal discovery.

THE occurrence of native gold in the following rocks has been noted: In quartz, almost universally in mining regions; in calcite, Alvord mine and Carbonate mine, San Bernardino county, Cal.; in diabase, Bear Valley, Mariposa county, Cal.; in diorite, near Big Oak Flat, Tuolumne county, Cal.; in andesite, Bodie, Cal.; in trachite, Black Hills, South Dakota; in phonolite, Black Hills, South Dakota, and Cripple Creek district, Colo.; in granite, at Soulsbyville, Tuolumne county, Cal.; in ankenite, Rawhide mine, Tuolumne county, Cal.; in mica schist, Old Bill mine, Potter ridge, Madera county, Cal.; in quartzite, Gold Chief mine and Gold Mountain mine, San Bernardino county, Cal., and at Red Cliff, Colo.; in limestone, at Black Hawk mines, San Bernardino county, Cal.; in feldspar, El Dorado county, Cal.; in felsite, Hexahedron mine, Colorado desert, Riverside county, Cal.; in sandstone, at Woodlawn, Colo.; in chlorite schist, Caledonia mine, Black Hills, and in Amador county, Cal.; in talc, Amador and Calaveras counties, Cal.; in quartz porphyry, Lava Beds district, San Bernardino county, Cal.

OVERMAN'S METALLURGY, published in 1852, calls attention to the fact that aluminum mixed with "iron" has a toughening influence, and that certain East Indian steel contained this metal as alloy. He adds that iron smelted from clay ores is stronger than any other kind. Of nickel as an alloy with iron, he says: "Nickel is found native and alloyed with meteoric iron. This alloy has been little examined, and is to all appearance of slight practical value." In the case of aluminum, he was evidently correct, while concerning nickel he was as evidently wrong, as the manufacture of Harveyized steel has shown.

A PERSON claiming a location cannot hold the same without complying with the laws in regard to assessment work. The simple fact of posting a notice, informing "whom it may concern" that the claim is not open to location for the reason that work has been resumed, will not hold in law, for, in the advent of an adverse claim, he must bring proofs of having done the assessment work as required by law. In a case where a claim holder has neglected to perform the required assessment work, he may at the last moment resume work and continue it until the required $100 worth has been completed, and thus hold his claim; but should he fail to accomplish the full amount required, he cannot hold the claim as against another.

THERE has been considerable talk about the rise in the Colorado river the coming summer. Owing to the unusual quantity of snow in the mountains of Colorado and Wyoming and on all the headwaters of the tributaries forming the Colorado river, it is thought the river will be very high in May and June of this year. When the Gila also rises at the same time the river gets unusually high. There has been much speculation as to the probable overflow of the river into the Salton basin, formerly an arm of the Gulf of California. In '92 this did occur and a large quantity of water ran into the basin, reaching the lowest portion of the depression at Salton. There is not the least probability of the river filling the basin for the reason that the volume of water flowing in the river is not sufficient to accomplish it in a single year. The superficial area of the basin is nearly 2000 square miles; its average depth probably 100 feet, the greatest depth being 275 feet at Salton Salt Works. The volume of water in the Colorado river at Yuma at flood time varies considerably, but assuming a mean depth at time of high water to be 15 feet, and if the entire system flowed through a crevasse in its bank, it would require more than three years of continuous flow to fill the basin to sea level, making no allowance for evaporation, which in that dry, heated atmosphere is enormous. As the point at which the river would flow into the basin is considerably above sea level, it is obvious that the area and consequently the capacity of the basin would be greatly enlarged.

Auriferous Zones in the Hanging Wall of the Mother Lode of California.

Written for the MINING AND SCIENTIFIC PRESS.

Along the Mother Lode of California are found great, massive outcrops of quartz forming in many places striking features of the landscape. The croppings are often seen 10 to 80 feet in height and sometimes several hundred feet in length. In width these great masses of quartz vary from 10 feet to upwards of 100 feet. Some of the most prominent and important of these quartz masses are the May Rock in Bear valley and at the Pine Tree-Josephine mine; at several mines near Coulterville and on Pinon Blanco in Mariposa county; in Tuolumne county at the Shawmut and Eagle mines at Quartz mountain and northward, at the Crystalline and Alabama mines, and again at and near the Rawhide mine. In Calaveras county the massive outcrops appear on Carson Hill and northward on Chaparral Hill and Bald Hill, also near Angels. Again these large croppings are seen north of San Andreas. In Amador county they are less pronounced, though some large outcrops do occur near Drytown. Several large outcrops also occur in El Dorado county.

These heavy, massive croppings of quartz have been called by miners since early days the boulder vein. This does not seem to be the proper term, for in some localities there are several veins, nearly parallel, outcropping as described, and it then becomes a matter of choice which is the boulder vein. The large amount of work done on the mines of that portion of the gold belt known as the Mother Lode has demonstrated that in many cases these large, bold outcrops were almost destitute of gold. Many of the largest and richest pay shoots are found in slaty zones lying east of these massive outcrops. Particularly is this the case in the counties of Calaveras, Tuolumne and Mariposa.

In Tuolumne county several miners have been exploring the hanging wall country and have found zones of pay rock lying east of the massive quartz veins heretofore recognized as the principal fissures of this portion of the gold belt. At the Shawmut–Eagle mines north of Jacksonville a broad zone of gold-bearing silicious schistose rock has been found, containing an unusual percentage of auriferous pyrite. Recently John D. E. Nelson, who is developing the Blue Lead mine on Moccasin creek, about two miles south of the Shawmut–Eagle mine, has discovered a broad slaty zone of rock to be gold-bearing which formerly was considered worthless. A crosscut tunnel is being driven toward this zone, which will cut it more than 100 feet from the surface. In this case the large massive quartz cropping lying west of this auriferous slaty zone was found so low grade in gold as to be almost worthless. The crosscutting of the slaty zone by the tunnel will give much valuable information on this interesting matter.

Still farther south, on the Grant mine, is a large dyke-like mass of felsitic rock impregnated with auriferous pyrite. The rock is quite silicious, but not at all like the massive quartz so characteristic of veins in this portion of the gold belt.

These several occurrences are but a few of a number of important instances of similar character. The Utica-Stickle mine at Angels, in Calaveras county, is is the hanging wall country of the so-called boulder vein, which in this camp is generally recognized as lying in the Madison-Gold Cliff groups, nearly half a mile west of the Utica-Sticle ore channel. In Tuolumne county a number of important gold-bearing deposits have been worked, and are still paying, which lie east of the "boulder vein" and are distinctly of schistose rock —a gold-bearing greenstone schist, more or less silicious.

The Diamond Drill in Prospecting.

Written for the MINING AND SCIENTIFIC PRESS.

The usefulness of the diamond drill for the purpose of prospecting new mineral regions and for exploring the ground beyond the limits of the workings of operating mines has long since been recognized, and that this excellent method of obtaining valuable and necessary information at a minimum of cost is not more commonly applied is strange. The field of usefulness of the diamond drill is broad, but there are many places where its employment in the hands of inexperienced operators would be of no material benfit. The driller may handle the machine skillfully and accomplish all that could be desired from a mechanical standpoint, but a knowledge of geology is a great aid, if not an absolute necessity, in successfully prosecuting investigations along this line. The diamond drill is usually employed for the purpose of locating the position of ore shoots on a vein which has already more or less development; but it may also be used in prospecting for veins and deposits, of the absolute existence of which there is no positive knowledge, and as preliminary to permanent development.

When, from the appearance of float rock on the surface, or in the soil overlying the bedrock, or the existence of a vein on adjoining property, make prospecting advisable, the diamond drill may be successfully employed in determining the fact of the existence or non-existence of such supposed vein, its size, strike and dip determined, ore shoots located and their value ascertained at the very minimum of expense. To obtain the best results, holes must be located systematically and a careful record kept, not only of the distance from the top of the bore to a vein which may be discovered, but of every change in the formation. Should the bit cut through a vein, the first hole only conveys the information that a vein exists at that certain point, but its strike, dip and size still remain to be determined. The drill may strike pay rock and continue in it for a considerable distance, indicating a large deposit, but when a shaft is sunk later it is discovered that the vein is really small, the diamond drill having penetrated it at an angle approximating its dip. A series of holes may be bored from a single standpoint with best results. Three or four holes bored on a common vertical plane at varying angles, each bore reaching the vein, will determine approximately the dip of the vein. Assuming the first hole to be bored from

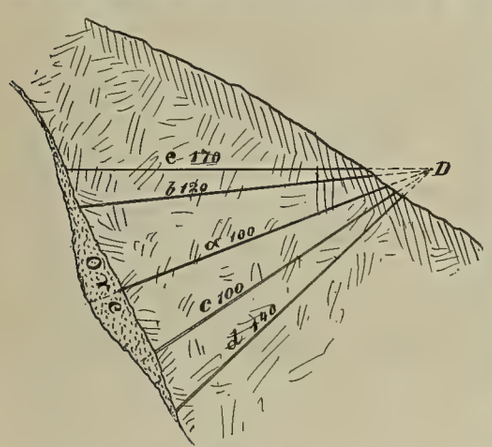

FIG. 1.

D (Fig. 1) at an angle of, say, 30° below the horizontal, and in this hole a vein is encountered at a depth of 100 feet. The bore is continued and reaches the opposite wall of the vein at a distance of 20 feet. A plat is then made, drawn to scale, on which should be shown the profile of the surface, and a line drawn from the position of the drilling machine at *D* in the direction of the bore along *a* and the point at which the vein was first encountered indicated, as also the point at which the drill passed out of the vein into barren rock. A second bore, *b*, may be made at an angle of 15°. This advances 120 feet before any sign of a vein is encountered. At this point the drill enters the vein and continues in it for 3 feet. These results should also be carefully indicated on the plat. The third bore, *C*, is made at an angle of 40° and imdiately below and in the same plane as the first two. This reaches the vein at 100 feet and passes through it in 4 feet. The fourth hole, *d*, may be bored at 50° and reaches the vein in 140 feet, passing through it in 1 foot. Thus far the plat indicates the existence of a vein dipping from the surface toward and underneath the drilling machine at approximately an angle of 50°. It being desirable, perhaps, to determine its position nearer the surface, presuming that no croppings are visible, a fifth bore, *e*, is made from the same position at a low angle, which reaches the vein at 170 feet and passes through it in 6 inches. The indications now are that the vein is persistent in its dip, but varies greatly in size. The hanging wall is seemingly regular, but No. 1 bore apparently passed through the ore body where a swell occurs in the footwall. Two additional holes should now be bored, one to the right and one to the left of the first series. They should be bored at or near a right angle to the plane of the dip. This angle, explorations thus far indicates, should be downward at about 45°, or approximately on the plane of No. 1 bore (*a*, Fig. 1), but they should also diverge 45° to either side of

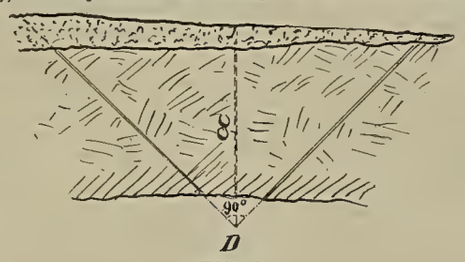

FIG. 2.

a. It is found that No. 6 hole reaches the vein in 120 feet, passing through it in 5 feet. No. 7 reaches the vein in 130 feet, and passes through it in 20 feet. Sufficient information has now been obtained upon which to base a reliable calculation. There has been demonstrated the existence of a vein having an approximate dip of 50°. The side holes determine its strike. A large ore body has been located, but not fully outlined, though enough has been proven to indicate what next should be done to develop the mine. The machine should be moved along the strike of the vein and another series of holes may be intelligently located and bored, to determine still further the extent and value of the ore shoot.

All this work has been preliminary to the development of the mine by actual workings, but in this manner not only the strike and dip of the vein, but the trend of the ore shoot, its size and value, are ascertained, and the permanent working shaft may then be located with reference to the future economical working of the mine, and the danger of making an error in this direction overcome. Possibly the values in the vein may justify no shaft at all; ; but, rich or poor, the position of the vein is positively determined and a complete knowledge of all its economcal features has been attained.

The example chosen is a very simple one, but it illustrates how any irregularity of whatever nature may be determined.

Where large veins or mineral-bearing zones are to be explored, there is less likelihood of missing the deposit entirely; but even in these cases great care is necessary, and a carefully made plan of the bore holes is indispensible.

A certain large gold mine in California at one period of its history, not more than six years ago, was considered worked out, and it was all but abandoned. Under new management, the diamond drill was employed, and in a few months it was demonstrated that there were immense ore bodies, wholly unsuspected, lying within the limits of the property. Additional ground was purchased, and now a large vertical shaft is being sunk, and this property has been given a new lease of life that will successfully endure many years.

Mining Industry in Mexico.

The secretary of the embassy at Mexico, Mr. McCreery, sends, under date of April 3rd, '99, a copy of the message of President Diaz on the opening of Congress, from which the following paragraphs in regard to mining matters are taken:

"The mining industry is that which affords most evidences of rapid progress, as in the period covered by this report 1040 title deeds, covering 11,408 pertenencias of 1 hectare (2.471 acres) each, have been issued. The total number of title deeds issued, subject to the new legislation of June, 1892, is 9353, covering 77,774 pertenencias of 1 hectare each.

"The exportation of ore has also increased to a noteworthy degree. Taking the figures recently published by the Department of Finance for the seven months—July to January—of the present fiscal year, it appears that the value of the exportation of mineral products, metallic and non-metallic, was $54,311,000 in round figures, showing an increase of $1,043,000 over the value of the same products exported in the corresponding period of the previous year.

"As an important event in the mining industry, I will state that the Adventurer tunnel at Batopilas, which is nearly 3 kilometers (1.86 miles) in length, which has been fifteen years under construction and has cost millions of dollars, has just struck the principal lodes of the camp."

THE following wise advice is offered by an exchange: "The time for investors to sell copper stocks is the year 1899, with Lake copper above 19c and going higher. The time for investors to buy copper stocks will be when the metal is under 8c and copper mines are closing down all over the world."

Some Experiences of a Working Miner.

NUMBER XIII.

Written for the MINING AND SCIENTIFIC PRESS.

I was talking not long since with Mr. D——, a wealthy merchant of a New England city, about mines and the present activity in mining generally. He put his hands deep into his pockets, as though he thought I might attempt to relieve him of their contents, and remarked in a very positive manner:

"Don't want any more mining in mine."

"Oh," said I, "you have had some experience in mining, have you? I did not know of it."

"Yes, I have been there and am satisfied," said he. "I don't want any more. It's a disgraceful business."

I wondered what sort of a snag he had struck in his mining operations and inquired sympathetically as to his difficulties with the mining industry. He related his experience as follows:

"About five years a man came to P——, where I was in business. He represented that he had a gold mine in M—— county, California, and showed some rock in which the gold could be seen in big chunks. He got a number of merchants of my city to organize a corporation and subscribe for stock, and all that sort of thing, and I went in and put up $5000 along with several others."

Here he stopped short and I inquired, "Now, how about the rest of it?"

"There was no rest to it," said he. "That's the last I ever saw of my $5000, and I don't want any more mines."

"Where is the mine?" I know a great many mines in California and perhaps I can put you on the tract of what became of your money."

"I don't know. Up in M—— county, somewhere."

"And you, nor your friends, never saw the mine?" I inquired.

"No," was the reply. "I never did, nor any of us. I don't know, in fact, that there is any such a mine at all. I have forgotten the name of it."

"Do you really mean to tell me," I asked, "that yourself and several other business men actually put up $5000 apiece on a mine located in M—— county, California, without ever investigating the matter at all? Who was this fellow who got you into the scheme?"

"I don't know who he was," said Mr. D——, thoughtfully. "I should know him if I saw him again, I think. He was a nice appearing fellow, dressed well, a good talker, and seemed to have plenty of money, and he had good letters."

I was obliged to laugh at his earnestness, particularly when he said he thought he would know him if he should meet again.

I said: "Now, Mr. D——, for this unfortunate and, I must say, foolish investment you condemn the mining business as an industry—an honest, legitimate business, as much so as yours, more so than yours, and without which, if you only knew it, you could not get along. Would you be willing to take the word of a perfect stranger as to the value of a stock of goods in your line in an establishment in a distant State, and buy them for spot cash without an investigation, even though you wanted such goods at that place?"

"No, most assuredly not," was the prompt response. "I wouldn't think of such a thing, but this was such a plausible fellow, and he had the rock with the gold in it."

I feel sorry for O——. He has so many locations, and it costs him so much for assessment work every year. In fact, he is obliged to relocate a number of his claims annually in order to hold on to them. Among his numerous locations are several copper mines (?), on which he places great value. He has a string of assay certificates pasted together, making a strip nearly 50 feet long. For a long time O—— spoke with pride of his rich copper mines at O——. "They carry 18° to 25%," said he, "every ton of the ore—and there's a mountain of it."

Some mining men went out to the property and made an examination, taking fifty or more samples. They commenced assaying and on the first ten tests the results ran from 1.6% to 2.1%. O—— came in and inquired how they were getting along, and was told "All right," but that the results were somewhat lower than had been represented. They showed him the results they had obtained and O—— was angry. O—— hastened out of the assay office and soon returned with his roll of assays, which he unrolled with some energy, and said: "Look at these—the men who made these assays understand their business. Here—20%, 19%, 16%, 21%. See it?" "Yes," replied the assayer, "I see it, but I also see a decimal point in each of these figures. They read 2.0%, 1.9%, 1.6%, 2.1%, which all agree, approximately with the results we are now obtaining."

O—— put on his glasses and gazed long and intently at his certificates and in each case found he had neglected to notice the decimal point. He left the place a somewhat wiser, sadder and madder man. It is doubtful if these mines are absorbed by the copper combine.

This instance brings to mind the case of the man

who sent his rock for assay and got the following returns: Gold $6.00, sulphurets 2%.

He immediately figured it out as follows: If 1 ton contains 2%, 100 tons will contain 2 tons of sulphurets, worth $600, or $300 per ton. To some extent this was the fault of the assayer in not distinctly stating that the sulphurets constituted 2% of the rock and assayed $6 per ton.

Increase in Price of Zinc Bringing American Zinc Properties into Prominence.

New England people are beginning to take considerable interest in lead and zinc mining in western Missouri and eastern Kansas.

Natural gas has been found in southeastern Kansas, and three smelting plants there are now being operated entirely by natural gas.

The recent rise in the price of zinc ore, which has been greater than the advance in ingot copper, has brought American zinc properties before the public as never before.

Zinc ores sold recently at $52 per ton for 60% ore, which is the standard, the price paid by the smelters' agents at the mines varying above or below this price according to the increase or decrease of the percentage of zinc in the ore. The previous highest price was $48.50 per ton. A year ago the price was $26 per ton, or one-half the present extreme price, and a few years ago the price was well below $20.

The advance in zinc has been due to the exhaustion of important mines abroad, especially in Belgium, where they have been worked below the sea level and flooded, also to the increased consumption of brass, which is made of zinc and copper, and the expansion of the electric field and the development of the cyanide process for gold extraction. South Africa alone is said to consume 40,000 tons of zinc in the extraction of gold through the cyanide process. There is no such thing as zinc scrap. Zinc is eaten up or vaporized, and is more distinctly consumed than any other metal. It is estimated that, in the production of $40,000 in gold by the cyanide process, two tons of zinc are eaten up. In the electric field it is the only negative metal, and there is as yet no substitute for it. It is very volatile, and in the ore-smelting process it is first vaporized and then condensed. It requires three tons of coal to smelt one ton of zinc, and therefore zinc ores are carried to the coal fields or to the natural gas wells.

A few years ago we exported no zinc in ore or pig. The Government reports show for the calender years the following as the zinc exports of the United States the past four years:

Year.	*Ore, Lbs.*	*Pig Metal, Lbs.*
1895	48,000	3,060,805
1896	4,150,000	20,260,169
1897	16,520,000	28,490,662
1898	21,040,000	20,998,413

The world's production of zinc is said to be about 400,000 tons of zinc ore, of which the United States is now producing 265,000 tons per annum. Last year the United States produced 235,000 tons of zinc ore, an increase over '97 of 53,000 tons. As three-quarters of the American supply comes from the Missouri-Kansas district, which will run above 50% of metallic zinc in the ore, the American production of zinc can be safely set down as now about 270,000,000 pounds, which was the American production of copper but a very few years ago.

As in copper, the positive metal in the electric field, so in zinc America now controls the markets of the world. It would appear that America had only the telegraph and telephone development of the world, but the electric railway development, the electric machinery development, and the control of both the positive and negative metals essential in the production and distribution of electricity. The following comparison of the present annual American production of copper, zinc and lead is made with that of ten years ago and '80:

	1880.	*1889.*	*1899.*
Copper, lbs	60,480,000	231,246,214	560,000,000
Zinc, lbs.	46,478,000	117,720,000	270,000,000
Lead, lbs.	195,650,000	383,934,000	450,000,000

The great zinc field of America is at Joplin, Mo., and a radius of fifteen miles from the center of Joplin embraces the entire territory of zinc production in this region so far as is now known. Smelting profits and mining profits here have been something astonishing, and miners who cannot read or write have been made millionaires from a few hundred acres of land. Leases are more common than in other mining operations as production on this basis is simple and easy for both land owner and miner. A miner can take lease of about one acre of ground, or what is known as a miner's lot, 200 feet square, drill through the soil and limestone from 200 feet to 500 feet, and if he opens out a zinc chamber he can sink a shaft and begin operations with a hand hoist until he gets enough ore to warrant a steam hoist. Then about $6000 will provide a milling and washing plant, which will crush and wash out 250 tons of ore per week ready for sale to the agents of the smelter who buy at the mines, and make payment every Saturday night. All the stores and banks of Joplin and the country round about are open until late Saturday evening, and everything is settled upon a weekly basis. It takes twelve tons of water to wash out one ton of ore. Leases range from 5% to 40% of the gross output as rental. At the present high price for zinc ores the miners are getting the best of it, but when zinc is low the land owner may hold the advantage.

It is said that the present high price of zinc ore is stimulated by the increased smelting capacity of the district, as smelters once started can close down only at considerable loss; but as the foreign markets lead us in the advances in zinc or spelter, as the pure metal is called, the present industrial prosperity and the electrical development may be looked to as the mainspring of all other causes for advancing prices. It is said that there are thirty-two pounds of brass in the car bearings under each of the 1,500,000 cars of the United States, which have to be replaced four times a year and this uses up a tremendous amount of both zinc and copper. Zinc is coming into use very largely for step coverings. It has the clinging quality for the foothold, wears well and is not affected by the weather, but under a strong heat it vaporizes and leaves no residuum as do other metals. Probably the largest use for zinc is in coating iron through the manufacture of galvanized iron. Galvanized nails are rapidly supplanting all other iron nails.

The Miocene Gravel Mine of Cariboo, B. C.

The new shaft at the Miocene gravel mine near Harper Camp, B. C., is well under way. It has three compartments, 4x5 feet each, timbered with sawed sets. It is down 140 feet in blue gravel, but it is estimated that 300 feet more will be necessary to reach bedrock. A former shaft on this property failed to reach bedrock at 400 feet. The new shaft house, an illustration of which is herewith given, is

MIOCENE GRAVEL MINE, CARIBOO, B. C.

60x100 feet, lighted by electricity. The plant comprises two boilers, the hoisting engine, four large steam pumps, sawmill, electric machinery, etc.

The ancient river channels of Cariboo are very extensive in the Quesnelle and Horsefly, but as yet are little known, though as far as development has proceeded are rich. Unlike the most of those of California, they lie low and require heavy machinery and large capital to develop them.

Aluminum in England.

E. Ristori recently read a paper on aluminum before the British Institution of Mechanical Engineers at Derby, England, in which he gave an account of the present state of the aluminum industry in England, and in connection therewith made some interesting comments on the applications of the pure metal and its alloys.

Mr. Ristori stated that aluminum could be forged hot or cold and in comparison with other metals it ranks third in order for malleability and sixth for ductility.

Sheets have been hammered as thin as $\frac{1}{10000}$ inch.

One casting alloy having a specific gravity of 2.9 is now largely used, but its composition is still kept secret. It has been found to produce remarkably clean castings which required very little machining to finish up and takes a high polish. Another valuable alloy contains aluminum and a small proportion of copper. The two alloys particularly recommended as among the best yet made are both ternary alloys and next to the aluminum, tungsten is the leading ingredient in each. In one of them copper is present to a small extent, and in the other nickel, and both have given astonishing results as regards strength and elongation. Samples of rolled sheets or rods made of these alloys show as much as twenty to twenty-two tons tensile strength per square inch with 5% to 10% elongation in 4 inches. Aluminum bronzes are undoubtedly superior in strength and they are especially suitable for marine engineering. Aluminum or one of its light alloys should to a large extent replace copper, tin and nickel, and its use in shipbuilding is growing rapidly on account of its great saving of weight.

Tungsten and Its Uses *

By A. C. Ross, Sydney, C. B.

There is very little literature on the occurrence of this metal. It is found in an ore known as wolfram or wolframite and is usually associated with tin, as, for instance, the tin mines of Cornwall.

The uses of this metal are numerous. It is especially valuable as an alloy for steel and is useful in the manufacture of tool steel, armor plate, guns and projectiles on account of its hardening, toughening and self-tempering qualities. It has been found to be almost impossible to get a uniform temper in the manufacture of large guns with the ordinary alloy used with steel. In the recent war between the United States and Spain the large guns were found to be practically useless after being fired from 60 to 100 times. The chambers, not being of uniform hardness, became scored. A small percentage of tungsten as an alloy will give the uniform hardness and temper required to any mass of steel. Nine per cent of tungsten alloyed with steel will give a self-tempered tool steel for lathe and other work which will stand great wear. It is also used in making dies and stamps. What is known to-day in commerce as "mushet" steel, which is manufactured in Sheffield, contains 9% of tungsten. This steel sells to-day (small quantities being imported as ordered for special lathe work) for seven times as much as the highest priced ordinary tool steel. It is a self-tempering steel and is conceded to be the best steel made for lathe, planing, boring and slotting tools, milling and nail cutters, counter-sink and twist drills, taps and dies and hot punches. It does not twist in hardening, is easy to forge, file or tool, and machines may and should be driven at a speed far in excess of any that can be used with any other steel. Tungsten steel has a great capacity for retaining magnetism, a German specimen showing a remanent magnetic moment of 62 units as against 37 units for "diamond steel," 5 units for "Martin steel" and only 3 units for "Bessemer steel."

The annual production of the metal in the world does not exceed 1000 tons. The demand greatly exceeds the supply even with the existing high prices. If it proves to be in this country in sufficient quantity to enable its being put on the market at say half its present value, its consumption would increase a thousand fold.

All miners will appreciate the great advantage it would be to have rock drills that would not soften in work no matter at what speed they might be driven, but remain tempered and ready for work on being ground or hammered to the required shape. A tool of tungsten steel can be pointed on an emery wheel, or with a hammer after being heated to a cherry red, and used on the hardest cast steel without being tempered by emersion in oil or water. The ore concentrates well on account of its high specific gravity.

*Condensed from a paper read before the April meeting of the Mining Society of Nova Scotia.

THE Anaconda Copper M. Co. is well known. The purchase, equipment and development of its mines represent an expenditure of $72,000,000, every dollar of which was taken from the mines. The company produces nearly one-fifth of the world's annual copper product. It employs 5000 men and owns ninety-one mining claims. Its great smelters and refinery at Anaconda cost $9,000,000; 200 cars, or 6000 tons, of ore are taken from the mines daily. The veins of the Anaconda vary from 10 to 100 feet in width and are all but inexhaustible. Hamilton Smith, the London expert, when he recommended to the London Exploration Co. the purchase of a half interest in the Anaconda mines, said there was sufficient ore then exposed to ensure a continuous output for fifty years. It produced during '98 122,000,000 pounds of copper besides several millions of dollars in gold and silver.

THE Calumet & Hecla M. Co. is one of the greatest in the world. It owns practically the whole village of Calumet; owns the water works, smelting works, its docks, railroads, churches twenty-six in number, eight schools, hospitals and almost everything else. Since it was organized in '71 it has paid over $60,000,000 in dividends, and there are now $7,000,000 in the company's treasury. The stamping mills are on the banks of Torch lake and crush annually over 2,000,000 tons of copper conglomerate. The copper-bearing bed or vein is 35 feet in width and has been worked to a depth of more than a mile. This distance is travelled by the cages in about two and a half minutes.

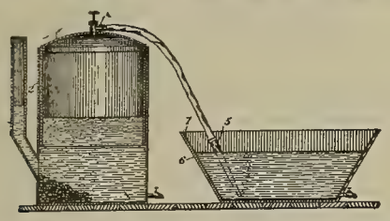
THE first practical demonstration of the value of wireless telegraphy at sea was given recently when a steamer collided with the East Goodwin lightship on Goodwin Sand off Kent coast in a fog. Both vessels had wireless instruments on board by which they learned their proximity and slackened speed. The damage sustained in the collision was inconsiderable.

Latest Mining and Metallurgical Patents.

Patents Issued May 2, 1899.

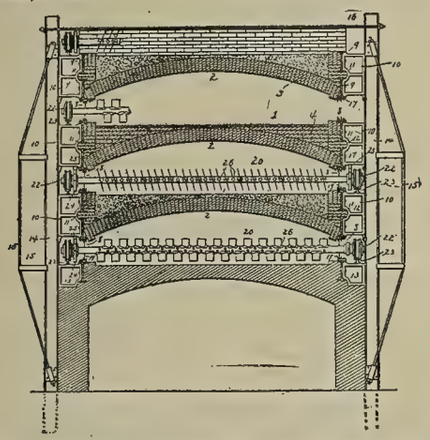
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROCESS OF REDUCING METALS FROM THEIR SOLUTIONS.—No. 624,040; C. B. Jacobs, East Orange, N. J.



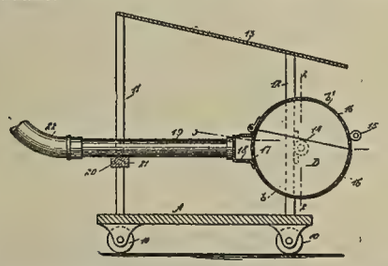
A process of reducing metals from their solutions consisting in subjecting to the action of gaseous phosphide of hydrogen in the presence of an alkaline material thereby precipitating the noble metals in a metallic state and the base metals as phosphides, and then separating the latter from the noble metals.

ROASTING FURNACE.—No, 624,048; H. A. Keller, Butte, Mont.



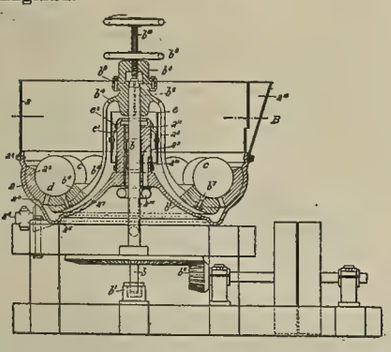
A roasting furnace having a hearth made of loose silicious material.

MINING DEVICE.—No. 624,281; C. Wright, Salmon City, Idaho.



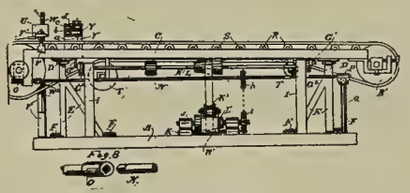
A thawing device comprising a movable frame, a cylindrical fuel chamber mounted upon said frame by axial journals, said chamber having a fuel-charging door and also a series of gas-discharge openings on one side, and air-supply chamber extending along one side of the fuel chamber and connected with its interior by holes through the wall between, an air-supply pipe connected to air chamber and serving also as a handle to control position of chamber, and a shield or cover supported from frame and extending over fuel chamber.

GRINDING MILL.—No. 624,139; A. G. Wells, London, England.



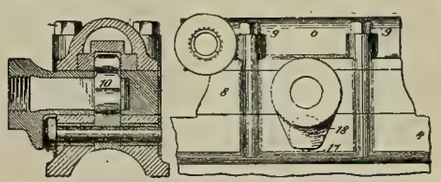
A grinding and amalgamating mill for treating auriferous and argentiferous ores in combination; a stationary pan and a revoluble overhanging yoke fitted with annular concaved grinding rings forming a channel adapted to support a series of crushing balls and a continuous annular opening leading to the pan bottom, the revoluble yoke being formed with openings for the circulation of the pulp and adjustably supported on a shaft rotated by gearing, and the pan being formed with an annular mercury trough, an upwardly inclined bottom and an upraised central part adapted to serve as a guide to the shaft supporting the revoluble yoke, and having an outlet a^9 for pulp leading to a discharging pipe below the pan bottom; a shutter adjustably applied to the upraised center part of the pan and serving to regulate the overflow level of the inlets to the pulp outlets; a cylindrical shield adjustably applied to the upraised central part of the pan around the pulp outlets thereof, and a series of crushing balls adapted to roll around within the channel formed by the grinding rings and to be actuated by the rotation of one of such rings.

ENDLESS BELT CONCENTRATOR.—No. 624,215; J. Jacobs, Henley, Cal.



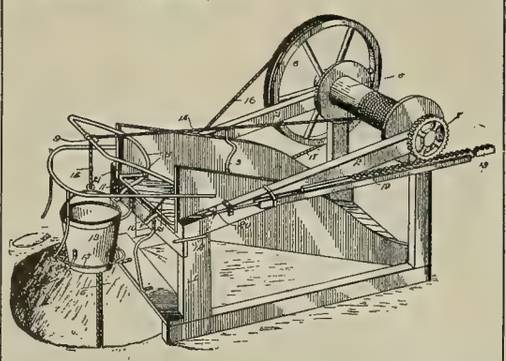
An endless traveling belt concentrator, the main frame or base, a shaking frame having drums or rollers at opposite ends over which the endless belt passes, an eccentric shaft journaled essentially parallel with the side of the shaking frame with eccentrics fixed thereon and connections between the eccentrics and the ends of the shaking frame, standards having their upper ends fitting in concaved boxes on the lower side of the skaking frame, the lower ends divergent and journaled longitudinally in boxes upon the main frame, said boxes having slotted bolt holes and bolts by which they are secured and adjustable transversely upon the main frame and with relation to the upper ends of the standards; a pulp distributing box positioned between the water box and the lower end of the belt, said box having holes in the bottom at one side, a horizontal diaphragm above said bottom and extending the full length of the interior of the box, with an open slot in the side opposite to the holes, and a vertically disposed distributing rib fixed parallel thereto upon its upper surface, and a removable cover with a supply opening leading to the side of the rib opposite to the slots in the diaphragm.

ROCK DRILL.—No. 624,181; H. V. Conrad, North Tarrytown, N. Y.



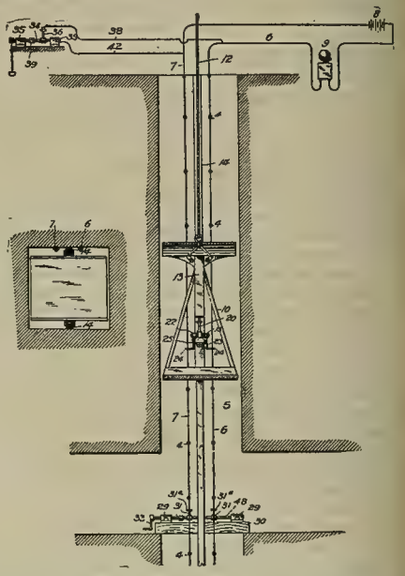
In a rock drill, the combination, with the cylinder and the piston arranged to reciprocate therein, a valve chest and a valve for controlling the supply and exhaust of the motive fluid to and from the cylinder, of a rocker mounted in the cylinder casting, a cylindrical pivot pin upon which said rocker is mounted, a head or shouldered portion of the said pivot pin for preventing longitudinal movement of the pin in one direction, an intermediate chamber between the cylinder casting and the valve chamber, a lug or overhanging ear upon the said intermediate chamber adapted to prevent the longitudinal movement of the pin in the other direction, and a means for securing the valve chest, intermediate chamber, and cylinder together.

HOISTING AND DUMPING MACHINE.—No. 624,288; G. H. Bowers, Salida, Colo.



An apparatus for hoisting substances from shafts or wells, the combination of a hoisting bucket, a hoisting rope connected with the bucket, a pulley for leading the rope to and from well or shaft, a vibrating frame carrying a guide pulley, a windlass comprising a drum and an operating wheel, and an operating cord leading into shaft or well for operating windlass drum in either direction; the combination of an elevator bucket provided with a hoop or band, a hoisting rope connected with bucket, a tilting frame provided with talons or hooks adapted to engage the hoop or band on bucket, a guide pulley mounted on tilting frame, means for operating hoisting rope or cable to raise bucket and tilt frame, and means for reversing movement and throwing tilting frame back to normal position.

ELECTRIC SIGNALING SYSTEM.—No. 624,390; E. S. Simms, Denver, Colo.



An electric signaling system for mining shafts, the combination of a normally open electrical circuit having conductors supported in shaft, a signaling device located in circuit, circuit-closing mechanism located in proximity to said conductors, and comprising a shaft suitably journaled, contact arms mounted on shaft and arranged to engage conductors when shaft is actuated, the contact arms being electrically connected, and means for automatically returning shaft to its normal position, whereby the circuit is opened; and distinct circuit-closing devices located at one or more stations in the shaft, whereby the circuit may be closed and the signal given from the cage or station as desired; circuit-closing means also located at the top of the shaft, whereby the circuit may be closed and the signal given from the cage, from any station and also from the top of the shaft, as may be desired.

Blue Asbestos.*

By H. E. OLDS.

Blue asbestos is a variety of that mineral found only in South Africa. It occurs in Griqualand West, and is mined over an area of 30,000 acres. It differs from the other varieties of asbestos, such as the Italian, Canadian, or Russian, not only in that it is blue in color, but in being considerably lighter. The asbestos is found in veins, seldom less than 2, or more often 4 to 5 inches wide, formed of closely compacted parallel fibers, which run from wall to wall of the vein without break or fault. The grain is very fine, and even in the rough state the fibers are singularly distinct. Several veins are found, always in regular extent, and the fiber always lies at right angles to the sides of the deposit. The enclosing rock is a hard brown shale. The fibers are somewhat elastic, and easily separable by the fingers. The character of the rock varies considerably; some places are soft and some hard; the better quality asbestos occurs in the hard rock. Its color is a peculiar lavender-blue, and is caused by the large proportion of protoxide of iron it contains.

*Condensed from a paper read before the English Institution of Mining and Metallurgy.

REPORTS of a new discovery of gold in Alaska are in circulation. They are of the most sensational character, and, if these reports are confirmed later, another rush will undoubtedly result. The new gold field is near Cape Nome, a point of land projecting into Behring's sea between Norton and Kotzebue sounds. The camp already established lies on the seashore and is called Nome. Those who are already in Alaska will be the first to reach the new El Dorado, and their numbers will be swelled by the tide from the Pacific coast States and British Columbia, and it would not be surprising to see a larger town spring up than at Skaguay or Dawson. The place is said to be easy of access, the gravel shallow and the pay good.

Railroads in China.

China's first railroad was opened in 1876 between Shanghai, the New York of China, and Wusung, fourteen miles distant, lying more directly upon the seacoast on an estuary of the Yangtze, with which Shanghai is connected by Wusung river. Its existence, however, was very brief, for native prejudice and superstition were so strong that the local authorities bought up the line, which had been constructed by British enterprise, tore up the rails, and abandoned it. Five years later, an English engineer, who had been placed in charge of some coal mines near Tientsin, found in existence a tramway over which coal was transported on cars pushed by Chinese workmen, and gradually extending it north and south, finally placed a steam engine upon it for use in transporting coal. Chinese prejudice, after finding that the use of the engines did not bring the disaster anticipated, gave way and the roadway developed into one general traffic, and extended little by little until it reached Tientsin at the south and the treaty port of Shanhai-kwan on the north, and, proving successful and popular, was further extended from Tientsin to within a short distance of Pekin, with which it was connected by an electric road, the entire system proving so popular that it soon became necessary to enlarge its facilities, its patronage being gathered from native as well as foreign interests and individuals. From Pekin it has been extended southwestwardly to Paoting, and thence is expected to penetrate the important coal and iron regions lying within easy reach.

This comparatively short system of 350 miles, connecting the capital of the Empire with two of the important treaty ports on the coast and with Paoting, the capital of the province in the interior, is the germ from which has sprung a prospective railway system of more than ten times its former length.

The Sources of Atmospheric Electricity.

M. H. Pellat has been conducting some experiments to investigate the sources of atmospheric electricity. It was formerly supposed that the evaporation of the moisture of the earth's surface was the cause of the electric charge of the atmosphere, but it had not been proved that highly charged water when evaporated lost any of its charge with the vapor. It has been shown that, with a potential of 25,000 volts, the liquid lost some of its charge, but in this case the liquid was pulverized, and was widely removed from the ordinary condition of water. M. Pellat negatively charged to 116 volts water in a very shallow dish and connected it with a quadrant electrometer, and after an hour's evaporation it showed a loss of from 40% to 60%. He thinks that the negative charge of the earth must suffer a loss, and the air must gain in negative charge during the first warm hours of the day, and that the reverse process sets in after sunset.—Electricity.

Massachusetts Institute of Technology.

At the last meeting of the Society of Arts of the Massachusetts Institute of Technology, T. B. Kinraide presented a unique form of induction coil of great power. This has been especially applied to the study of discharges by the aid of photographic processes, the plate being balanced on the point of discharge in a dark room and being developed after exposure. It reveals in a striking manner the marked difference that exists between the positive and negative discharges. The apparatus was exhibited in operation and photographic plates shown with the lantern. The figures thus produced by the electric discharge were of extraordinary beauty and size, the delicacy of detail being brought out by means of the lantern. It is thought they may be suggestive of forms useful to designers and decorators.

The Situation at Wardner.

The following proclamation has been issued by State Auditor Sinclair, acting for the Governor of Idaho, at Wardner:

To the Mine Owners of Shoshone County: Certain organizations or combinations existing in Shoshone county have shown themselves to be criminal in purposely procuring property to be destroyed and murder to be committed, by reason whereof it has been twice necessary to declare martial law in Shoshone county.

You are therefore notified that the employment of men belonging to said or other criminal organizations during the continuance of martial law must cease. In case this direction is not obeyed your mines will be closed.

Therefore, in order to carry into effect the spirit of the foregoing notice and restore the industries of the district as far as possible it becomes necessary to establish a system by which miners may obtain work.

The following is promulgated for the guidance of all mine owners and employes in the affected district:

All parties applying for underground work in any of the mines will be required to obtain from Dr. Hugh France a permit authorizing said person so applying to seek for and obtain employment. Mine owners must refuse employment to all applicants for underground work without presentation by parties seeking employment of a duly signed certificate authorizing the same. All parties now under employment by any of the mines above named will be required to procure within ten days from this date the certificates above referred to as a condition of their remaining in the service of their respective companies.

By order of the Governor and commander in chief.

BARTLETT SINCLAIR,
State Auditor.

Thawing Frozen Ground.

The *Engineering News* reports an expedient adopted by a contractor at Decatur, Mich., for making holes for electric light poles in frozen ground. Dynamite had proved unsuccessful, but the method explained in the following lines proved satisfactory: A vertical jet pipe was connected by a tee to a horizontal pipe 24 inches long, capped at one end and connected at the other by nipples and four elbows, with a pipe leading to the boiler of the traction engine, the nipples and elbows allowed the necessary play in handling the appliance. To protect the workmen from the steam and to enable them to manipulate the jet pipe, two wooden handles, 2x4 inches and 10 feet long, were connected by stirrups to the two ends of the short horizontal pipe. This jet pipe was forced down by two men pressing on the handles; and, as the earth thawed out, the steam would carry the particles out alongside the pipe; and as the depth increased more steam would be condensed in the bore-hole, until finally no steam escaped and the overflow was liquid mud. We are told that by the adoption of this plan thirty holes for electric light poles were thawed out in a day of ten hours. Mr. Pearl says that while a large percentage of all the water service pipes throughout the town were frozen, though laid at a depth of 4 to 5 feet below the surface, the really hard frozen ground was seldom over 30 inches deep, and generally only 24 inches deep. Below this depth the earth seemed to lack the moisture necessary to make it very hard when frozen.

Industrial Notes.

—An $800,000,000 steel trust is reported to be forming in the East.

—London reports the visible supply of copper May 1 to have been 26,529 tons, a decrease of 111 tons since April 15.

—It is stated that 46% of the traffic of the Mexican Central Railroad is in the transportation of ores.

—The U. S. Rubber Co. announce an advance of 10% on the price of rubber boots and shoes the coming season.

Personal.

W. A. FARRISH has returned to Colorado from Salt Lake, Utah.

O. P. POSEY of Colorado has been inspecting mines at Bingham, Utah.

S. T. LANGLEY, a mining operator of Rossland, B. C., is in San Francisco, Cal.

C. D. LANE of Angels, Cal., has returned from a trip to the mines of Arizona and Mexico.

C. HALL has been placed in charge of the Fortune placer mines at Tarryall, Park county, Colo.

W. H. BROWN, Supt. Mountain Lion mine of Republic, Wash., has returned from Portland, Or., to the mine.

E. R. ABADIE, formerly of Grass Valley, Cal., and more recently of Minas Prietas, Mexico, has engaged to go to South Africa.

CHARLES M. BECKER of Central City, Colo., has taken a position with the Smuggler-Union M. Co. at Telluride, and will have charge of the underground work.

F. F. THOMAS, E. M., Supt. Gwin mine, Calaveras county, Cal., who has been ill for several months, has recovered sufficiently to return to the mine.

CLARENCE KING, Dr. R. W. Raymond, Louis Janin and W. Lindgren have left Rossland, B. C., for their homes, the Iron Mask-Center Star trial having ended, as far as they are concerned.

R. J. CORY, Western manager of the Edward P. Allis Co., has returned to Denver from Butte, Mont., Spokane, Wash., the Cœur d'Alenes in Idaho, and other points in the Northwest.

T. B. BASSETT, recently Supt. of the cyanide department of the American Girl mine, in the Cargo Muchacho mountains, near Hedges, Cal., will install and take charge of a cyanide plant at the Kenton mine, Sierra county, Cal.

PROF. J. C. BRANNER, Vice-Pres. Stanford University, has left with Harold Havens, A. W. Greeley, C. E. Gilman, Ray Collins and Bert Collins, students at Stanford, on a scientific expedition to the coast of Brazil. They propose to investigate the coral and sand storm formations on the coast from Rio Janeiro 1400 miles north to near Cape St. Roque, with a view to settling a controversy of long standing regarding such formations.

H. W. FAIRBANKS leaves San Francisco in a few days on a three months' trip accompanied by a number of students of Berkeley and Stanford Universities. The party will explore the region east of the Sierra Nevadas from Inyo county, Cal., northward into Oregon, including western Nevada. A study will be made of the geology, mineralogy and physical geography of that portion of the great basin. They will visit Crater lake and the lakes of Oregon which have been formed by a series of faults.

Recent Mining Incorporations.

Nob Hill Oil & Development Co., Los Angeles, Cal.; capital stock, $150,000; subscribed, $76,000; W. E. de Groot, C. R. Lockwood, A. de Groot, C. J. Lehman, W. I. Lockwood.

Independent M. Co., Ltd., San Francisco; capital stock, $100,000; subscribed, $5; S. Kampe, R. W. Schultze, W. J. Smale, W. F. Schultze.

Alaska Development & Exploration Co., San Francisco; capital stock, $25,000; subscribed, $5; S. Kampe, C. H. Greene, M. J. Lee, J. A. Clover, C. F. Humphrey.

Globe Oil Co., Fresno, Cal.; capital stock, $250,000—all subscribed; F. Bader, K. H. Sim, W. Ross, C. K. Puskhaber, E. Schwartz, O. Nestle, E. J. Weimar, C. Hegard.

The Occidental Exploration Co. has been organized by S. J. Hendy, H. Zadig, F. H. Hansman, H. Eptein and W. S. Sutherland for the purpose of developing mines in California, Montana and Idaho.

Commercial Paragraphs.

THE Truax Ore Car Manufacturing Co. of San Francisco has received 45,000 pounds sheet steel, cut to order, from Pennsylvania, to be used in the manufacture of their ore cars. They report a large demand for cars.

THE Edward P. Allis Co. of Milwaukee, Wis., recently secured a contract to supply the machinery to double the capacity of the Le Roi smelter at Northport, Wash. This will give that plant a daily capacity of 800 tons.

THE large compound, condensing mine pump, built by the Jeanesville Iron Works Co. at Jeanesville, Pa., for the Ibex mine at Leadville, Colo., was shipped from Jeanesville last Saturday. It required two cars. It is the first steam mine pump having a 36-inch stroke in the Leadville district. The specification was made up by the mechanical engineer of the Ibex Company.

Books Received.

"*Practical Notes on the Cyanide Process;*" octavo, 202 pp., illustrated; Francis L. Bosqui. This volume treats the cyanide process in a thoroughly practical and comprehensive manner, giving many illustrations and details of construction, which must be of value to all engaged or interested in cyaniding of ores. Considerable space is devoted to South Africa and New Zealand, but the greatest amount is given to the operations in the United States. The history of the process is given and also its practical application, with the method of making laboratory tests. The design of works is fully treated, as well as details of construction. All the various operations of the process are described with its many modifications. Scientific Publishing Co., New York and London. Price $2.50.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MAY 2, 1899.

624,424.—CAN LABELING MACHINE—W. D. Ayers, Alameda, Cal.
624,303.—FEED WATER HEATER—L. D. Copeland, Phœnix, A. T.
624,306.—ELECTRIC WATER BOILER—J. C. Cramer, Los Angeles, Cal.
624,309.—BANJO TAILPIECE—C. S. DeLano, Los Angeles, Cal.
624,313.—THREAD BOX—Mattie J. Edwards, Los Angeles, Cal.
624,013.—PLAITING MACHINE—T. F. Hagerty, S. F.
624,014.—PLAITING MACHINE—T. F. Hagerty, S. F.
624,033.—VEHICLE SPRING—S. C. Hitchcock, Tacoma, Wash.
624,215.—CONCENTRATOR—J. Jacobs, Henley, Cal.
624,355.—VAPOR ENGINE—E. L. Lowe, Astoria, Ogn.
624,070.—WATER HEATER—J. McCartney, Oakland, Cal.
624,071.—GAS HEATER—J. McCartney, Oakland, Cal.
624,064.—VEHICLE BRAKE—Miller & McDonough, Ferndale, Cal.
624,362.—LEVELING ROD—Milliken & Bowen, Ontario, Ogn.
624,069.—SAFETY POCKET—M. M. Murray, Baxter, Cal.
624,378.—THRESHER—H. A. Rands, Forest Grove, Cal.
624,097.—BOTTLE WASHING MACHINE—J. R. Robb, S. F.
624,102.—JOURNAL OILER—A. C. Rumble, Oakland, Cal.
624,103.—SAFETY AIR BRAKE—A. C. Rumble, Oakland, Cal.
624,409.—ELEVATOR CONTROLLER—B. C. Von Emon, S. F.
624,416.—BOTTLE—E. West, Vallejo, Cal.
30,651.—DESIGN FOR SPOON—J. E. Schmitt, Tacoma, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOTTLE WASHING MACHINE.—J. R. Robb, San Francisco, Cal. No. 624,097. Dated May 2, 1899. This invention relates to a device which is designed for the rapid and complete cleansing of bottles. It consists of a conical vessel containing a jet nozzle, means for controlling the supply of water to the nozzle, a tube disposed in line with the nozzle so that the water and scouring material are directed into the bottle when the latter is inverted for the tube, means whereby the tube is adjustable to and from the nozzle and a plurality of cones of decreasing sizes are arranged within the outer vessel so as to prevent the packing of the scouring material at any one point. These cones have overflow passages connecting one with the other, and the sand or other scouring material sliding down the inner surfaces of the cones is brought into line with the upwardly moving jet of water so as to be carried with it up into the bottle and be discharged through openings at the top of the tube against the bottom and sides of the bottle, thence falling down the exterior of the tube into the cones, it is again brought into the circulation.

ENDLESS BELT CONCENTRATOR.—Jehu Jacobs, Henley, Cal. No. 624,215. Dated May 2, 1899. This invention relates to improvements in concentrators of that class in which an endless belt is caused to travel over drums or rollers supported in a frame that stands at a slight inclination. It consists of a main frame, an endless belt-carrying frame with drums about which the belt is movable, hinged supporting standards for this supplemental frame and mechanism by which the belt and frame are oscillated transversely to the line of travel of the belt. A worm gear is provided through which motion is transmitted to drive the belt and the standards upon which the shaking frame is supported and have their lower ends journaled in boxes which are adjustable with relation to the frames so as to at all times regulate the level of the belt transversely. The speed at which the parts of the belt travel is regulated by means of cone pulleys, with intermediate belts, and the material is distributed upon the belt by means of boxes having holes in the bottom at one side and a horizontal diaphragm disposed with relation to said holes, the vertically disposed distributing rib fixed parallel to it upon its upper surface and a supply opening leading to the side of the rib opposite the slots in the diaphragm.

VEHICLE BRAKE.—Leah J. Miller and Wm. McDonough, Ferndale, Cal. No. 624,064. Dated May 2, 1899. This invention relates to improvements in the construction of wagons, carriages and similar vehicles. It consists essentially in the pivoting of both front and rear axles, so that they are turnable about their independent pivots or king-bolts, and in combining therewith a reach formed in two sections, so united that the turning of one pair of wheels in one direction will turn the other pair equally in the opposite direction. A rock shaft is journaled upon the fixed rear bolster and its arm is connected with the front brake lever, a central arm extending downwardly from the rock shaft and a yoke fulcrumed transversely and turnable in the lower end of said arm. The brake beam is carried by the rear portion of the jointed reach and the shoes are adapted to press against the rear wheels, and divergent rods connect the turnable rod with the brake beam.

The Grand Canyon of the Colorado as a Mining Field.

Written for the MINING AND SCIENTIFIC PRESS.

The Grand Canyon of the Colorado river, in Arizona, is one of the grandest of nature's works. Those who have never visited it can form no conception of its solemn beauty and majesty; but it possesses other attractions than those of scenic beauty. The ceaseless scouring of the Colorado river through thousands of feet of sedimentary beds and deep into the underlying crystalline rocks, has exposed to view mineral-bearing veins in the Archæan and ore-bearing horizons in the lower members of the sedimentary beds of unknown extent. The possibilities of this region can only be surmised. The Archæan rocks in certain portions of the canyon are known to contain veins carrying iron and copper, and the natural inference is that gold and other metals are there also. Lying upon these upturned schists, granite and other rocks common to the Archæan, are the nearly horizontal beds of the Silurian, and, higher, the Devonian and Carboniferous formatious. The rocks of these three geological ages are well known throughout the West—in Colorado, Utah and Nevada particularly—to be the repositories of large and valuable ore deposits. The limestones and quartzites are most frequently ore-bearing. In the States referred to ores occur associated with sheets and dykes of intrusive rocks and also in massive eruptive rocks, as at Cripple Creek and in San Juan county, in Colorado. In the Grand Canyon are exposed hundreds of feet of limestones and quartzites, and in some localities these are intercalated by sheets of eruptive rock and cut by vertical dykes. Lead carbonate ores have been found in several localities, one not far from the Little Colorado. Only the difficulties of transportation to be overcome are a drawback to prospecting in this region. Since lead-silver ores are known to exist there, it is not unreasonable to think that gold as well may be found where the geological conditions are so favorable. The lead-silver ore thus far found is of very good grade; it is chiefly carbonate of lead, carrying chloride of silver—a smelting ore. Aerial tramways, operated by water power furnished by the Colorado river, may be a means of solving the transportation problem. The bottom of the canyon can be reached at several places, but the cost of packing ore out on rugged trails to a height of 5000 or 6000 feet is too costly an undertaking for any ordinary ores to stand.

New Carbide Plant.

The great new carbide plant that is being erected at Niagara Falls on the lands of the Niagara Falls Power Co. will have greater floor space than any other manufacturing plant at Niagara. In all, there will be three buildings, two for manufacturing carbide and one to be used as an office structure. The first of the factory buildings is now well along in construction. This building is of brick, and has a total length of 864 feet. Its companion structure has been started. The front portion of the first building is three stories in height. This section is to be known as the grinding department, and occupies a space 75x132 feet. Next comes a two-story section, 30x75 feet, the lower floor of which is to be the dust collector room, and the upper floor will be used as a wash room and a clothes room by the employes, provision being made that they may change their clothes before going out on the street from their work. The furnace room will have a width of 75 feet and a length of 395 feet, and there will be installed no less than seventy-five furnaces. These furnaces will be of the continuous type, and are new being manufactured at Niagara Falls. In the rear of the furnace room will be the shipping room, its dimensions to be 75x300 feet. Through the center of this will be run railroad tracks, and along these tracks platforms 100 feet long will be built in order to facilitate entrance to the cars and aid in the shipment of the product of the plant. The output capacity of the works will be fifteen carloads of calcium carbide every day, and it is a noticeable fact that nothing is said in the plans for the buildings about a storage department. In other words the demand for carbide has become so great that this plant, working night and day, barely expects to keep up with its orders.—Iron and Steel.

Aluminum as a Medium of Electrical Transmission.

Until recently the only metal employed commercially for transmitting currents of electricity for lighting, street railway and power purposes was copper. This, as is well known, was due to the fact that copper offers less resistance, bulk for bulk, to the passage of a current of electricity than any other metal, if we except possibly one or two of the precious metals whose cost would naturally prohibit their being used on anything like an extensive scale. The amount of copper produced annually in this country and utilized principally in the electrical industry is something enormous, representing in '98 an investment of over $85,000,000. Possibly a better idea of this demand for copper in electrical enterprises may be gotten when it is stated that the electrical street railways alone built last year in the United States required for their operation, in line conductors and feeders, over 5000 gross tons of this metal, representing an investment of more than $2,000,000. The outlay for copper in electrical undertakings where it is necessary to transmit current to any considerable distance, as may readily be inferred from the above, is by no means insignificant, it being in fact one of the heaviest items of expense, and as the price of copper has for some time been steadily rising, electrical engineers have been seeking for a suitable and less costly substitute. This it is believed has now to a certain extent been found in aluminum, and although the resistance of an aluminum conductor to the passage of an electric current is between 60% and 75% greater than the resistance offered by a copper conductor of the same cross section, the difference in the weight of the two metals more than makes up for the difference in conductivity as well as the difference in the cost, leaving a balance of between one and three cents to the pound in favor of aluminum, everything else being equal. An electrical engineer in charge of a large lighting plant in the South, who has examined into the matter very thoroughly and is about to make use of aluminum conductors, recently summed up the matter as follows:

"Copper has a specific gravity of 8.93, whereas aluminum has 2.68, these being the relative weights per unit. Yet it takes a larger volume, or a wire of greater sectional area, of aluminum for a given amount of current than copper. The difference being: copper 100, aluminum 160. Aluminum has some disadvantages, one being the difficulty of soldering it together. On the other hand, its advantage is its great tensile strength, having 26,000 pounds per square inch, while the tensile strength of soft copper, the kind most generally used, is only 16,500 pounds per square inch. With the sectional area of aluminum for equal conductivity with that of copper as 160 is to 100, you can readily see that the tensile strength of an aluminum conductor is more than twice the strength of copper, yet the weight is not half as great as copper, being only 48% of that of copper for a conductor of equal conductivity. It having greater ductility makes it more desirable for the reason that it does not break or fracture so easily on bending."

From this it will be seen that owing to the greater tensile strength of an aluminum conductor over one of copper, considerably longer spans could be constructed between poles were the former metal made use of, thus effecting a material saving in expense in line work. What however will probably have a greater effect than anything else in making aluminum conductors popular is, that the cost of producing this metal is gradually becoming less each year, as more improved methods of reduction are being adopted, while the price of copper is rising. At the present day, everything else being equal, owing to the excessive price of copper, the balance from a financial standpoint would seem to be slightly in favor of aluminum for conductors, and judging the great reduction in the price of aluminum that has occurred from time to time in the past it should not be very long before that metal will be by far the most economical for transmission lines. That it is already in the field as a competitor of copper may be inferred from the fact that many miles of aluminum wires are in operation throughout the country, and it is said that an aluminum transmission line thirty miles in length will shortly be constructed in California.—Electricity.

Barbed Wire Telephone.

N. A. Dorn writes that the Salinas Valley, Cal., Land Co. has a telephone system in which a barbed-wire fence is the connecting medium. The line consists of the ordinary barbed wire that was already on the fences along the road from Salinas City to one of the company's ranches. It is about ten miles long the way it runs. We use a good telephone instrument. The requisites to success are to see that all the connections are made very close, that no wire is connected with the ground in any way, either by hanging down or by touching any other wire that does reach the ground.

In crossing roads and gates, we use two methods. The preferable one is to have posts high enough to carry an overhead wire, but in this country a great many high derricks are used with threshing outfits, so we took ⅝-inch iron water pipe and laid under the gates and most of the roads and then ran a rubber covered wire through them to connect with the barbed wire on each side. This is out of the way and never noticed at all, though it is more apt to get broken than an overhead wire. It is cheaper than poles, though. We bent the ends of the pipe up at the sides of the gates or roads and then filled the ends up with putty to keep water out of the pipes and prevent rotting the rubber on the wire. One of the chief requisites for success is to have a 'phone with a good, strong electro-magnetic call tube.

This character of telephone line will work just as well as any insulated line in dry weather, but it will not work at all when it is raining, because the current runs in the ground as soon as the posts are wet, and the line is then of no practical value. Our line has worked well every day since it was built last July, excepting seven days and parts of five or six. As soon as the posts have time to dry off after a rain it is all right again and is a very great convenience. To us it is almost worth five men's wages all the time. In dry countries like many of our Western States and Territories such lines will work for any reasonable distance, say 1 to 100 miles, and will seldom be disturbed by rains, but in States where it often rains it will not do well.

Liquid Air.

The *Engineer*, speaking of the remarkable properties claimed for liquid air, asks, "Will history repeat itself?" and continues:

"From the paper read by Prof. Rice and the remarks of C. E. Tripler on liquid air at the last meeting of the Junior Members of the American Society of Mechanical Engineers, it is very evident that there is little foundation in experiment or theory for the marvelous economy in power production claimed for liquid air. The old, inexorable law that nature cannot be cheated still holds good.

"The gross energy expended primarily is the extreme limit that can be realized in any transformation of mechanical power, and to secure 100 per cent it is necessary to eliminate all losses from friction, condensation, etc.

"The active exploitation of air-power devices of late, coming at a time of feverish speculation, is indicative of a purpose to work the public. The average man knows as little of the science of pneumatics as of electricity. In the earlier development of the electrical industries the belief was common that electricity, like the hand of Midas, had the magical power of turning into gold everything it touched. The lesson that electrical enterprises are amenable to the same laws of economics as those of every other sort had to be learned. Many came out of electrical ventures sadder and wiser men. Unscrupulous men took advantage of the public's ignorant confidence in the mysterious force. This was not so long ago, either, but people forget quickly, and the time is ripe for a repetition of history by the exploitation of air power, though not on so large a scale. Croker and Leiter have opened the ball. Tripler's conversion of air into liquid, the astonishing things he has done with the stuff, and the still more astonishing things he promises to do—marvels that rival Jules Verne and the Arabian Nights — have brought the public to a state of open-mouthed wonderment. The sympathy between the mouth and the pocket has probably not escaped the notice of the astute promoters of air-power enterprises.

"Compressed air has a wide and legitimate field. A number of reputable concerns are developing it rapidly and creditably. It will be a misfortune to that branch of engineering if it is made the means of further inculcating the old lesson."

Transmission of Power for Underground Pumping.

A paper was recently read by Paul Habets before the Association des Ingenieurs de Liege, in which he says that underground pumping engines, whether worked by steam, hydraulic power, or electricity, are nearly equivalent as regards the consumption of steam. Methods with gearing are, however, more economical whenever a pumping engine is laid down of greater power than that actually required under ordinary circumstances, in order to provide for an increase in the quantity of water, in which case the pump does not work continuously, and if it be driven directly by a steam engine, its rate of consumption will increase in inverse proportion to the actual time it is at work. The advantage of reduced consumption, with suppression of the disadvantages caused by underground steam pipes, often compensates for the higher first cost of geared pumping engines. Hydraulic transmission has the advantage of great simplicity in the plant and its maintenance. The steam consumption of slow running compression engines, which may be fitted with very perfect valve-gear, may be reduced below 16½ pounds per H. P. per hour; and with compression engines not consuming more than 14½ pounds per indicated H. P., the consumption by the hydraulic pumping engines will be less than 22 pounds per H. P. in water raised. Electricity requires motors of high speed, or of moderate speed if the generating dynamo be driven directly, while they are of short stroke and often less perfect as regards their valve-gear; but otherwise the generating dynamo should be driven by belt or rope, which is not, however, so favorable as regards the general useful effect. The management of dynamos would appear to be more delicate than that of hydraulic engines; but, on the other hand, the transmission of current in the cables is more economical than that of hydraulic engines and more economical than that of water under pressure in the pipes, while cables are more easily laid than rigid pipes. Electricity, therefore, is better suited for long distances, while more readily lending itself to working appliances of all kinds; but the special conditions of each case will decide which means for transmitting power should be adopted.

Mining Summary.

ALASKA.

It is reported a strike has been made within five miles of Skaguay on Minnie creek by Mayor John Stanley and party. They found gold in gravel 2 feet from the surface and staked every claim and divided twenty-six claims among six.

Reports continue to come from Alaska of rich strikes near Cape Nome. This strike was made, it is claimed, last fall. A brief mention of it was made in the issue of April 22nd. The strike is on Snake river and its tributaries, twenty miles back from Cape Nome and 120 miles from St. Michael—just outside the St. Michael military reservation of the United States Government. There are great shoals caused by the discharge of detritus by the Yukon near the mouth of Snake river which extend far out into the Behring sea. The cape projects into the sea from the peninsula lying between the sea and the Arctic ocean. The new district will be comparatively easy of access as soon as the ice breaks up. Vessels of all kinds can reach a point off the coast, though the bluffs are sheer and the anchorage dangerous. Fuel is scarce, the supply being drawn from the driftwood which the Yukon carries down with its ice and distributes along the Bering shore. The discovery is wholly within American territory. The gravel is said to be rich, and it is reported that the diggings are shallow.

ARIZONA.

In a well driven to find a water supply for the King of Arizona mine near Yuma, a heavy flow was encountered in a gravel bed at a depth of 485 feet. Another well is being sunk nearer the mine.

Yuma *Sun*: The Plomosa placer district is attracting attention and the miners there are doing well. Mr. Martinez made a strike and has since been taking out $8 per day with a dry washer. Varcia & Martinez sunk a shaft 25 feet on the Catarina, near Tyson's Well, and got $50 in coarse gold on bedrock. C. Manuel picked up a nugget worth $20. Nuggets ranging between $3 and $10 are found every day. There are thirty men in camp.——A cooperative company of miners are working the Wickler mine on the Hassayampa, in Yavapai county, and making a success. Arrangements are being made for a mill and concentrator. The mine is well developed.

Florence *Tribune*: J. Miller has three claims immediately on the bank of the Gila, twenty-five miles east of Florence. They are prospects, one having a shaft 60 feet and the other two shafts 25 feet each. The rock is free milling, carrying $8 per ton gold.

Prescott *Courier*: The Gold Bug mine, Chaparral district, has improved with depth. On the surface the vein was 4 inches wide and carried $130 per ton gold; at 85 feet the vein is 12 inches wide and carries $225 gold. Water is also increasing with depth, which necessitates a hoist.

Arizona *Star*: It is reported that the Vulture mine will be reopened. The mine has been stocked for $190,000. A 100-stamp mill is to be erected and a force put in the mine.——The Sampson & Bent wolframite ores are to be worked by concentration. The final payment of $25,000 will be made in a few days. The camp is located in the Guija mountains, not far from Arivaca.

CALIFORNIA.

Amador.

Sutter Creek *Record*: At the South Spring Hill mines, Amador city district, Supt. Tregloan is having the ditches cleaned out preparatory to resuming active operations about the mines. —— The shaft is below the 1350-foot level at the Central-Eureka mine. A station will be put in and a crosscut run to the vein at the 1350. Sinking in the shaft will continue.

Amador *Ledger*: The Defender mine, near the Mokelumne river, at the left of the West Point road, is being developed, and the owner has bought the interest of T. B. Atkinson in a mine which joins the Defender on the east. The shaft on the Defender is 100 feet in depth, and a drift on the pay chute is in 279 feet. The rock pays $20 a ton free, the sulphurets are shipped to San Francisco and pay from $90 to $300 per ton.

Calaveras.

It is reported that sinking is to be resumed at the Esperanza mine, near Mokelumne Hill, and a new hoist erected. The shaft is 1000 feet deep and it will be sunk to 1500.

Near Albany Flat, south of Angels Camp, L. Tullock has run a lot of waste rock that was on the dump of his mine through the mill, and the rock yielded $5 to the ton. This led F. Brunner to work waste rock at his mine, which he found to be as good as in the mine. He has 1000 tons of this rock on the dump.

El Dorado.

(Special Correspondence).—It is reported that an Eastern firm has purchased the interest of E. A. Head in the Blue Gouge mine on Camp creek, and the new company will commence operations on the property. A new tunnel will be run considerably lower and farther north than the old one. A 5-stamp mill for prospecting purposes will be built. E. Bind is Supt. The mine consists of a zone of mineralized schist 400 feet in width in which occurs large veins of quartz separated by the schistose rock. This formation lies between the Calaveras clay slates on the east and grano-diorite on the west. It is claimed to be auriferous throughout.

Placerville, May 2nd, '99.

The miners in the vicinity of Volcanoville held a meeting recently and organized a mining district to be known as the Volcanoville mining district. J. W. Edmondson was elected recorder of the district.

Placerville *Democrat*: The Dench & Craddock 2-stamp mill at Placerville was started up last week. They have 100 tons of ore on the dump.

Inyo.

The P. D. Q. Cyanide Co. expect to get through at Montgomery's in ten days. They will move to the Reward mine and locate about ten miles east of Independence, where they have 10,000 tons of tailings and will put up a 50-ton plant. They have also 2000 tons in the Beverage district, sixteen miles from the Reward, which they have bought and which are good but difficult to work. There is no wagon road to this place and everything must be packed in on animals.

Kern.

The Kinyon mine has recently cleaned up $5000 from low-grade ore.

Randsburg *Miner*: Collins of the Black Hawk has cleaned up $800 from a run of thirty-two tons of ore, and from another run of forty-seven tons $930 was cleaned up.

Mariposa.

Hirschfield, Graves & Meade have bought the old Mexican mine near Hornitos and will put a force of men to work. This mine has been idle for several years.

The Washington mine, two and one-half miles northeast of Hornitos is credited with a production of over $1,500,000. It has two shafts and has been worked to a depth of 1500 feet. It has been idle for a long time.

The Quail M. & M. Co. has been incorporated by Sonora men to operate the Quail mine, ten miles east of Coultervile.

Nevada.

At the Texas mine in Willow Valley district a new plant has been built recently. Drifting on three ledges is in progress, and recently a fourth has been cut. These ledges range from 2 to 6 feet in width and are close together. A vertical shaft has been sunk 250 feet and a level established. A 10-inch plunger pump raises the water to a drain tunnel which taps the shaft at a depth of 90 feet. A smaller pump, which can be run by steam or air, is kept in reserve. In the two-compartment shaft a cage is used. Water is the motive power. The company recently purchased the Manzanita M. Co.'s property for their water rights. A line of 22 and 15-inch pipe runs 2400 feet from the ditch to the mine, giving a pressure of 300 feet. Steam power is kept in reserve. Four machine drills are in use. An exhaust fan is placed at the mouth of the drain tunnel, operated by the waste water from the hoisting works. The mill has ten stamps. Mill and hoist are lighted by electricity from a 30-light dynamo.

Grass Valley *Union*: An unusual amount of water in the Reddik mine has resulted in a temporary suspension.

Riverside.

At the O. K. mine, Virginia Dale district, a 50-foot drift has been run at the 200 level, and a 4-foot vein opened, assays running $45 per ton. The mine is owned by C. F. McNutt, E. K. Alpaugh of Los Angeles, J. Ingersoll of San Bernardino, and others.

It is reported that a gold-bearing vein has been discovered near the city of Riverside. The formation is granite similar to that at Gavilan and near the Good Hope and Santa Rosa mines.

San Bernardino.

(Special Correspondence).—Marcus Pluth, formerly mining boss at the Odessa and Occidental mines near Calico, with D. D. Connell has leased the Waterloo mine, two miles west of Calico, and also the 15-stamp Oriental mill near Daggett. The ore is shipped six miles by narrow gauge road from mine to mill. The Waterloo is one of the largest silver mines in California, and in its earlier history was worked extensively. The ore is a rhyolite breccia, in which the silver occurs as chloride. There is in the mine also a band of gray jasper that in some parts is rich in silver. The mine was closed several years ago on the fall in the price of silver.

Calico, May 1st, '99.

A company has been organized at San Bernardino to work the placer deposits of Lytle creek, several miles northwest of that city. A large amount of work has been done in this canyon in past years and considerable gold produced. There are numerous quartz veins in the district.

Sierra.

A strike was made recently at the York mine near Downieville. W. W. York and his sons are reported to have taken out $9000 from one carload of quartz, one of the pieces yielding $500.

Downieville *Messenger*: A mill will be constructed at the Alta mine, near Alleghany, formerly the Idaho, as soon as the season is opened. —— W. Williams and others have leased the Lucky Dog mine, near Forest City, owned by the North Fork Co., and have commenced work.—— W. York has taken from his mine in Slug canyon a number of pieces of quartz which weighed forty-seven ounces, containing twenty-five ounces gold.——G. M. Pinney of the Mountain mine, near Sierra City, has the foundation for one-half of the mill completed. Twenty stamps are dropping and three tons of ore to the stamp is milled daily, which averages $6 to $8 per ton. Forty stamps will be running in three weeks.

Nevada City *Herald*: Mgr. Dunlap has completed his survey of the Alaska mine, at Pike City, and has begun reopening the mine. A tunnel has been started in Oregon Creek canyon, to tap the lower workings and drain the water. It is wide enough for two tracks, and will run nearly 4000 feet.

Shasta.

Redding *Searchlight*: Supt. Dakin of the Uncle Sam G. M. Co. states that preparations are making for adding fifteen stamps to the mill, doubling the capacity. The company will also put in a cyanide plant, that having been decided since the strike of high-grade ore in the new ground. The full value of the ore can not be secured by amalgamation. Two concentrators will be added.

Redding *Mineral Wealth*: The Colorado Con. group of mines join the Old Spanish property on the southeast and are owned by a company of which G. Turner of Vancouver, B. C., is the head. They are sinking a double compartment shaft near the crossing of the Colorado and Gipsy veins. The shaft is timbered and covered with a shafthouse and shop. It is down 60 feet, at 100 feet crosscutting will begin. The Gipsy is down 50 feet and has a 3-foot vein carrying free gold and sulphurets. M. T. Howell is Supt. ——Work on the Argentum mine in Harrison Gulch district, owned by J. L. Johnson and W. A. Boswell of Shasta, is showing bodies of quartz.——A. Ludwig and S. Price have bonded two claims in Muletown district owned by Herzinger & Bauter. Supplies have been shipped and work will begin May 1st. Mr. Ludwig with Mr. Price will work the property.——Meier's camp on the summit between Shasta and the Mt. Shasta mine is now called Oro Vista, after one of the mines in the group.——Three hundred feet of tramway is being built by Stolberg & Maurer to connect their claim on Shurtleff hill with the Keswick road.——The Mountain Copper Co. is reported to have an improvement fund of $375,000 to be expended this year. The output of the mines is to be increased.——Dr. Lees and W. A. Pryor have sold a quartz claim on Clear Creek to J. Meier of Oro Vista.——A half ton of ore was taken from a seam in the claim owned by Apple Bros. & Shields of Keswick, that paid $6000. The property is within half a mile of Keswick on the Copely road.——The Mt. Shasta quartz mine is producing two grades of ore from the 300 level. Late smelter returns show that the low-grade ores run $65, $56 and $70 per ton for three shipments of seventy-five tons, and the high-grade ore $420 and $450 for two shipments of seventy-five tons. The Mt. Shasta from the surface has averaged $40 a ton.

Siskiyou.

Yreka *Journal*: Work continues in the New Klondike district on the Scott Valley road, between Yreka and the Forest House. The ledge is 40 feet wide. Several claims have been located.——The miners in the Golden Star or Spencer quartz mine at Humbug are running a tunnel on the ledge 185 feet. They will upraise to the works of the upper level. ——Parties have been among property owners along the western boundary line of the Yreka townsite, offering good prices for land for mining.——Copper ore has been found at the head of Dutch creek, above Honolulu, on Klamath river, bonded to Davenport & Co. a year ago. The rock assays 15% copper and $60 a ton in gold and silver.——Hutchinson, who bonded the Elliott mine at Cottage Grove, on Lower Klamath, is getting pay, having an abundance of water for the giants.

Etna *Advance*: Pay gravel continues to be taken from the Best Chance mine at Yreka. ——The Gumboot mine near Scott Bar is bonded for $20,000.——The arrastra at the Hathaway mine on Sugar creek is running day and night on high-grade ore.——At the Bouviere hydraulic mine on Slide creek new ground has been opened which is prospecting well.——A tunnel is to be run at La Flesch mine near Henley to reach, at a lower level, the body of ore recently struck.——A 12-stamp mill will be erected at A. P. Wagner's mine at Coffee creek. It is now at the Redding depot.——Welker Bros. have located a copper claim four and one-half miles above Callahan's. They have a prospect showing 20% copper.——Rich stringers have been found by M. Carrick at the head of Spring gulch on Yreka Flat.——The company preparing to dredge Yreka creek has paid land owners whose property they bonded $1000 each, the first installment.——Bolen & Rimmer have leased the lower part of the G. W. Smith drift mine at Sugar Hill, on the South Fork of Scott river.——The tunnel driven to the ledge below the present works at the Jillson & Roberts mine, near Henley, is in 250 feet. Thirty men are employed at the mine and mill.——A tunnel is being run at the Commodore Dewey claim at Schoolhouse Hill. The arrastra is run full time.——W. F. Short has contracted to drive a tunnel 400 feet at the Highland mine, near the Salmon summit at the head of the South Fork of Scott river. It will give a depth of 300 feet vertically.——At the Blue Gravel mine on Greenhorn creek, near Yreka, the force has been working on the north drift; $12,000 has been taken out since changing from the south drift.——Ward & Co. have men at work putting up the mill at the Cape mine on the North Fork of Greenhorn. ——F. Boudria is working his hydraulic mine on Wildcat creek. The first cleanup of the season was made last week. One giant is being run.——The Sheba M. Co. received $10,000 from a twenty-six day run on their Patterson Creek mill during March from 700 tons of ore. Since last July $30,000 has been extracted. The company is considering the advisability of doubling the capacity of the mill.

Yreka *Journal*: T. Austin & Co. have found a gravel deposit 60 feet across in their claim on Yreka Flats, which yields good returns. They are getting more water at bedrock. Their claim extends 50 feet farther north to the next claims of McNulty and Butler, when work will stop, unless favorable arrangements can be made with adjoining claimants to continue operations.——The Yreka Creek quartz mill this week crushed five tons of quartz from the Casey quartz ledge in Greenhorn gulch, near the Myers ranch, which paid well.——The Yreka M. Co., successor to the Greenhorn Blue Gravel Co., are realizing good pay at the mine in Greenhorn creek, a mile south of Yreka, and employ forty men.——The Commodore quartz mine at Barkhouse is a good producer and employs a large force in mill and mine. The ledge varies as the work progresses, but holds its usual average in gold.——A number of miners talk of organizing a miners' union in this county.——Mr. Souther, the manager for the company bonding Yreka creek north of Yreka townsite, is endeavoring to secure an option on the Parks place on Gold street, along the west side of Yreka, for prospecting.——J. G. Waugh discovered good prospects in working his claim on Beaver creek, Siskiyou mountain. A man named Knapp is working a claim in the same district on Hungry creek, and several more claims will be opened this season on Beaver, Hungry and Grouse creeks.——Spengler Bros. at the mouth of Humbug have finished ground sluicing and are washing the bedrock gravel.

Trinity.

A quartz mine near Carrville was recently bonded for $20,000, with ten days option.

Etna *Advance*: It is reported that a smelter will soon be erected at Carrville.

Tuolumne.

The miners of Sonora and vicinity have reorganized the Tuolumne mining district, with William Sharwood as president and Richard Inch recorder. A code of rules and regulations was adopted and a form of location certificate blank drawn up for use within the district. One feature of the local law is the requirement of two notices of location, one posted at each end of the claim.

The Mount Jefferson mine at Groveland is being extensively developed. It had remained idle for many years until recently. The old workings were 250 feet deep.

The shipment of sixteen tons of ore sent to Selby's last week from the Vine Spring mine near Columbia returned $43 per ton.

Sonora *Union-Democrat*: At the Mazeppa mine near Stent the main shaft is down 260 feet. A station will be put in at 300 feet, the vein crosscut and drifts started. On the 200 level machines are in use drifting. In the south drift at the 200 level work has been discontinued. The vein ranges in width from 12 to 28 feet. The mine is to be equipped with a 20-stamp mill.

COLORADO.

BOULDER COUNTY.

The Bailey mill at Eldora is completed. There are 600 tons of ore now in the mill.

The Mogul tunnel is still driving toward the Clara claim, on east of Spencer mountain, and new strikes have been made. Nothing is definitely known of the value of the latest strikes.

CHAFFEE COUNTY.

The Gold Bug mine at Turret City is to have a steam hoist, the holders of the bond and lease having secured an extension.

DOLORES COUNTY.

Rico *News-Sun*: The work of clearing the ground for the concentrating plant for the Enterprise group has been commenced.——The Golden Age, operated under lease by J. Haughton, is showing good ore. Twenty tons of ore were shipped last week.——J. T. Carnahan is working three 8-hour shifts on the tunnel being driven to open up the Union-Carbonate, one of the principal producers of the camp in the 90's.——The Pro Patria tunnel, driven for the Sawyer and Young properties is nearing the contact ore zone of Newman hill.

GUNNISON COUNTY.

The Kingsbury mines at Midland, four miles from Vulcan, are being developed.

At Spencer, six miles west from Vulcan, a strike is reported on the Gunnison lode. The ore is rich in gold.

The Doctor mine is being explored. The copper strike is proving better than at first.

The Venable, in a crosscut from the bottom of the 150-foot shaft, has a body of rich gold ore. Two sacks sent to Denver returned from $80 to $235 in value. The extent of the ore body has not been ascertained.

The strike in the Napolean mine, Pitkin district, is better than reported. The vein is 8 feet wide and the ore will run from 300 to 400 ounces of silver.

Pitkin *Miner*: A hundred tons of ore from the Maid of Athens mine will be sent to the smelter on the first train through Alpine tunnel.——Work is progressing on the eastern extension of the Maid of Athens under Supt. Osgood. Two shifts are employed. The shaft is down 85 feet.——Work will be resumed on the Leopard as soon as the road is open, some good ore having been struck.

HINSDALE COUNTY.

A winze has been started in the lower level of the Ute mine which will be sunk 200 feet. A crosscut will be driven from the bottom vein, which has a dip of 25°, making 230 feet of stoping ground. A tunnel at the mill level to cut the Ute vein is contemplated.

LAKE COUNTY.

The Penrose mine at Leadville is drained and the work now on hand is the cleaning and repairing of the workings. It is now a question of few days when the other mines will commence work.

Leadville *Miner*: The Mikado M. Co., of which W. R. Chadbourne of California is principal owner, has a large acreage on the northwest end of Iron hill, known as the Gallagher mine. It is one of the first mines discovered in Leadville and in early days was sold to the present owners by Gallagher Bros. The mine has produced high-grade silicious silver ore and iron sulphides. Up to October shipments of 100 tons per day of iron sulphides were maintained. The ore body was then exhausted and October 20 the working shaft was closed. In April, after four months' prospecting, a body of iron sulphides was opened and shipments will be started.

MINERAL COUNTY.

The Last Chance mine at Creede is to be drained through the Nelson tunnel. A station has been cut in the tunnel 7250 feet from its mouth. The surveys indicate that a distance of 50 feet separates the tunnel from the workings of the Last Chance on the 1200 level. The danger attending the work is fully realized.

OURAY COUNTY.

Ouray *Herald*: Buch & Grant have a year's lease on the Bright Diamond mill, and have put in a concentrator, which is giving good results. The plant is operating on Bright Diamond second-class ore.——The Bachelor No. 2 on Mt. Hayden, owned by Murphy & Sons, will resume operations; the product will be concentrated at the Beaumont

sampler. This property has a 2-foot vein of silver-lead ore.

PARK COUNTY.

A 100-foot contract has been let on the Mascotte tunnel to Lindell & Hancock.

Everett & Pasco will work the Bluebird placer, on the Platte, this season. Work will begin with sluicing; later a giant may be added.

Forty men are employed by the London, fifty by the Green Mountain Co., twenty-five by the Orphan Boy and fifty to one hundred by other mines at Alma.

SUMMIT COUNTY.

The Col. Sellers mine at Kokomo is shipping five to seven cars of low-grade ore daily.

Journal: The North American Gold Dredging Co., on the Swan river, last year built and operated two Risdon dredges, besides employing in another locality two Evans elevators for hoisting and washing gravel. Preparations are being made for the placer season. The Risdon Iron Works of San Francisco, Cal., has a man here for the purpose of putting in two more of these machines where Gold Run empties into the Swan.——At the Mountain Pride mine, near Breckenridge, work on the improvements has begun, including cottages for employes and a boarding-house. Mgr. H. C. Foote has plans and specifications for the new mill. The company will put in an electric motor at the mill.

SAN MIGUEL COUNTY.

The Silver Lip mine of Ophir district has 20 inches of rich free gold ore. As the trails are not yet opened no tests of the ore have been made.

The Marie Antoinette mine of Ophir, which opened a rich ore body last fall, has been leased and bonded to a company of Eastern men, which includes some of the stockholders of the Silver Pick on Mt. Wilson.

TELLER COUNTY.

Denver *Republican*: Mills treating the ore of Cripple Creek are taxed to their full capacity, and thousands of tons of ore are now on the sidings to these mills, waiting to be treated.——The Independence mine has increased its working force and a large production is to be made from that property from now on.——The Mary McKinney is producing and the Lucky Guss is commencing.——During the month of April the mines of Cripple Creek produced 37,700 tons of ore, which returned $1,439,200.——In the breast of the drift on the second level of the Jack Pot there is 5 feet of ore which Mgr. Davenport states assays over eighteen ounces to the ton. The output for the month of April was 1700 tons. The average grade of the ore is higher than formerly.

IDAHO.

At the Noonday mine, near Silverton, a crosscut tunnel has tapped the ore shoot, the ore assaying 130 ounces silver per ton. Two men are working on ore, who alone are mining, sorting and sacking a ton per day, running over 100 ounces in silver and 60% lead per ton. The management will divert the waters of Gold creek, which flows across the claim, and ground sluice off the top of the ledge, as there is known to be a large amount of float galena in the surface dirt.

At Wardner a proclamation has been issued by the State Auditor for the Governor commanding all mine owners and managers to refuse to employ union miners. Any mine failing to observe the proclamation will be shut down. All mines are closed except the Bunker Hill and Sullivan, where eighty non-union miners are working.

A. B. Campbell bought a half interest in the Sixteen-to-One mine of the Cœur d'Alenes for a quarter of a million, from J. W. Flitk and C. H. Linn. Campbell now owns eleven-sixteenths of the property.

Salt Lake *Tribune*: The force at the Humming Bird mine at Paris has been increased. It is understood that the Bear Lake Copper Co. will put in more machinery this summer.——Concentrators are to be added to the Washington mill in Wood river. It is the intention to work the silver ledge. Exploration will be pushed to locate the parallel gold ledge lost after the first ore body was worked out. The company owning the mine has been organized in Utah, by H. S. Woolley and K. P. Plowman of Idaho, and is known as the Harvest.

Wardner *News*: The management of the Bunker Hill & Sullivan has decided to rebuild and fifty men were put to work to remove the debris of the old mill. Others will work in the mine on first-class ore, and work on the tunnel will be resumed. The compressor at the mine will be used for this purpose.

Spokesman-Review: The Bimetallic group, on Lake Pen d'Oreille, sixteen miles from Hope, near the mouth of Granite creek, is to be developed. The claims are the Bimetallic, Free Coinage and Calumet, owned by a company of Chicago men. W. H. Mead of Spokane is Supt. and Gen. Mgr. The ledge is reported to be 4 to 16 feet wide, carrying galena, quartz and iron, running in silver and gold.

MICHIGAN.

Twelve pits sunk at different points on the Winona property showed copper as soon as rock was struck.

At the Wyandot copper was struck at one of the pits and at the other there was trouble with quicksand.

Specimens from the Meadow show rock well charged with copper. Shaft is down 100 feet.

It is expected that production will be begun at the Arcadian mine on July 1, with rock for three heads.

A contract for three stamps for the New Quincy mill has been let to the Edward P. Allis Co. of Milwaukee.

At the Baltic mine they are making preparations for regular production.

MISSOURI.

Boston *Statist*: Eighty acres of mineral land near Aurora have been sold to a Boston syndicate for $500,000. This land embraces the Tuttle mine and other zinc producers.

MONTANA.

Phillipsburg *Mail*: One hundred stamps are dropping at the mill of the Granite-Bimetallic Con. Co. at Clark. Three hundred and seventy men are employed in and about the works. The tramway is transporting more ore from the Bimetallic to the mill than ever before. Returning, the buckets are loaded with coal. The tramway between the Bimetallic and Granite hoists is nearing completion. Fifty-five bars of silver bullion represented last week's output, worth $74,498.50.——Work on the lower levels of the Hope mine has been discontinued and water is at the 300-foot level. A diamond drill has been operated at various points at the 550-foot level. The drills and machinery have been removed from the deep workings and the drill is operating above water level. A station pump having a capacity of 800 gallons per minute has been left at the 550-foot station, the water rising too rapidly to permit its removal.——Huffman & Butcher, who have been working mines owned by P. J. Brophy and others near Princeton under lease, have struck a body of ore which, it is said, will average over $100 per ton in gold, and forty-five tons are on the dump. Meacham & Clark will have charge of milling the ore. All the parties are interested in this mine and mill.

NEVADA.

The Dickey leaching plant at Unionville will not be moved to Como as previously reported.

Osceola, White Pine county, has a new 20-stamp mill in operation, it having been started on the 3rd inst. This new enterprise belongs to Scranton, Pa., people. The ore is from the Exchange, Eagle, Crescent and other mines near Osceola.

W. H. Bray has found a vein in San Juan canyon, thirty miles south of Austin. The ledge averages 100 feet in width and has been traced through three claims. Samples show assays in gold from $2.50 to $12 per ton and three ounces silver.

The Eastern men who bought the Reno reduction works of H. H. Beck have sent $10,000 from Boston, the first payment. Ore is being shipped to the works from mines at Oreana and the dynamos and other machinery have been shipped from the East.

Carson *News*: A 12-inch streak of ore in the Capitan mine in El Dorado canyon, Lincoln county, has widened to 3 feet carrying gold, silver and lead. The group of mines has been worked for years, the ore being crushed in a Huntington mill on the east bank of the Colorado river.

Carson *News*: A rich copper strike is reported from the vicinity of Genoa. Samples of the ore tested in a forge showed copper readily. Most of the copper ore in the western part of the State carries gold enough to pay for mining.

Silver State: Men are employed in prospecting the bonded copper mines near Golconda, and the discovery of placers has caused some excitement.——G. N. Shallenberger has discovered placers at Gold Run.——In the Adelaide mine discoveries of rich ore have been made on the 200 level.——Supt. Lindley has thirty men employed on his bonded mines on Granite creek.

NEW MEXICO.

The White Oak mine, at White Oaks, is under the management of J. Y. Hewitt. The mine has been worked for fifteen years. The new shaft has been sunk 1100 feet, nearly all in ore, the pay streak averaging over $100 to the ton in a vein 18 inches to 3 feet wide. The mine has a 20-stamp mill. Tailings go to a cyanide mill. The mine has produced $600,000

One mine in the Santa Rita district employs 350 men. One hundred new shafts have been sunk, the ore in which, it is reported, averages 20% copper.

The Santa Fe Copper Co., at San Pedro, are preparing to work. Their claims have been filed on. The old mill and smelter will be torn down and a new plant erected.

Discoveries of galena have been made at Kelley. A copper vein is being worked sixteen miles from there by Jenkins & Levy.

At Water canyon, fifteen miles from Socorro, the Buckeye has recently been reorganized with a capital of $150,000, employing fifteen men. On the Timber Peak property, near there, fifty men are employed.

The Graphic smelter, at Magdalena, employs thirty-five men; capacity, 100 tons. The ore is galena, with iron, lime, etc.

OREGON.

(Special Correspondence).—The Hall & Merit Improvement Co. of Duluth has extensive placers on Eagle creek, Union county, thirty miles from Baker City. They commenced operations in April, '98, by excavating eight miles of ditch 4 feet deep and 12 feet wide, with a half mile of 20-inch iron pipe, to which five giants are attached, with 200 feet pressure. The gravel is carried into a 30-inch sluice with block riffles. These mines are said to pay $10 per day to the man. They have started this season (May, '99) with a crew of ten men, to be increased to twenty-five by the 15th inst. The plant has cost the company $50,000.

Quartz mining in the vicinity of Baker City has of late taken quite an advance. The Bonanza, of which the Geiser family were owners, has changed hands at $1,000,000, and the Collateral, adjoining the Virtue, has been sold to Montreal parties for $60,000. Within the past four days the Union at Cornucopia has changed hands. It is reported that the price paid was $2,500,000. Other smaller properties in the same vicinity have lately been sold or bonded, prices ranging from $2000 to $10,000.

Salt Lake, Chicago, Denver and Spokane are represented here, with a few representatives from Europe.

Cornucopia, May 4th, '99.

The Rising Star mine, owned by McPhelim & Bowden, at the junction of Snake river and Pine creek, in Union county, is being developed by a shaft in which the vein is 4 feet wide. High-grade assays in silver and copper are reported as having been obtained.

It is reported that the Bonanza mine, near Baker City, has been sold for $2,000,000.

Sumpter *News*: The Success, owned by Cabell Bros. and Brattin, near Granite, is being developed.——It is reported that J. G. English of the Golconda has purchased the Buffalo mine, and as soon as the snow will permit will put men at work. This is an old mine, worked in the '70s.——The Red Boy mill has been running constantly since October, producing from $30,000 to $50,000 per month.——The May Queen is pushing development work. Their mill will go up as soon as roads are in shape to haul the machinery.——Waugh & Barrett have bonded the Gold Eagle, on Congo creek, an extension of the Blaine and Red Boy, to Utah men, who are running a 100-foot tunnel.——McAvoy & Sheridan of the Little Giant mine, on Spring creek, are driving a crosscut to tap the ledge at a greater depth. This property was bonded to W. L. Vinson of Seattle, Wash., last fall for $25,000, and he has had a force of men at work all winter.——The Benson & Thornburg mine at Granite is in 150 feet with the drift.

SOUTH DAKOTA.

The Wasp No. 2 Co. on Yellow creek is making arrangements to build a cyanide plant with twenty tons capacity.

Ragged Top ore is being treated at the Spearfish cyanide works.

It is reported that the old chlorination plant near Spearfish, which has never been in operation, is to be remodeled into a cyanide plant.

TENNESSEE.

The Ducktown mines, now owned by the Tennessee Copper Co., embraces 6000 acres, and has six miles on a low-grade copper vein of such width as to make it largely a quarrying proposition. The rock is copper sulphide, similar to that of the Rio Tinto mines of Spain, soft, and running 2% to 5% in copper. It is proposed to work 1000 tons of ore daily at a cost of less than 8 cents per pound. Fuel is $2.50 a ton and labor $1 a day. A near-by property, owing 600 acres, is the Ducktown Copper & Silver Co., largely owned in England. Connected with the Tennessee Copper Co. is an iron deposit, which the company proposes to work.

UTAH.

Park City *Record*: The Weber & Kearns mill has started up.——Rich ore has been found in the Comstock mine in a crosscut 100 feet from the main tunnel. At present it is 8 inches thick.——The orehouse at the Ontario mine is filled. Hauling has commenced.——The Daly leasers have made a clean-up on the upper levels, and ore extracted under the old lease was raised to the surface. Ore extracted on their new lease will be raised through the Ontario shaft.——Teams are hauling ore from the Silver King mine over the new road and all the miners were put in the mine. The new mill is nearly ready.——At the Daly-West ore is being piled up inside and outside awaiting shipment.

Mercur *Mercury*: A contract has been let to sink the shaft on the Elkhorn 50 feet.——The ore body recently struck in the West Mercur increases in size with depth.——It is reported that a silver strike has been made in the Eagle, also a copper strike. The working force has been increased.——Reports from the Malvern are encouraging. The incline is down 275 feet with a body of ore in sight which justifies the erection of a hoist and a mill as a possibility.——Sinking is to be resumed in the Snowstorm. The air pipes will be taken from the Gladstone and a blower put in.——Treatment of the tailings at the Mercur mill has commenced. A hoist is in place to raise the tailings to the level of the track, and the dumps, containing between 200,000 and 300,000 tons, will be put through the leaching process once more. They average $3 per ton.——The Bay State G. M. Co. has been incorporated to develop the Mishawka, Godiva, Mamie W. Riley, Silver Reef and Unexpected claims in Ophir district. The officers are C. H. Knox, Pres.; F. A. Foster, Vice-Pres.; E. S. Gatsch, Secy.; F. B. Mason, Treas.; with F. Hunt, J. T. Riley and M. Hawke as the other directors.——Work at the Mercur is going on steadily. Most of the ore is coming from open cuts in the gulch below the Sacramento, on the Mattie, Lulu and Nimrod, from which 200 tons of ore per day are taken. The same amount is being mined from the open cut above the main works. The ore bodies in the cuts are from 30 to 40 feet wide. Sinking 500 feet in the Lulu on the dip of the vein has shown no break. The incline on the north side of the hill is down below the deepest workings, and connections are being made with the Resolute and Ruby from this incline.

WASHINGTON.

The Mountain Lion mine of Republic is to have a three-compartment shaft, which is to be sunk 1000 feet.

The Golden Lily at Republic is sinking on a 5-foot vein, which assays from $2.06 near the surface up to $31 at 22 feet depth.——The new hoisting machinery on the Bodie is working successfully. The shaft is 115 feet deep, and will be sunk to 200 feet.

Spokane *Chronicle*: The Black Tail north and south lead has been found on the Lone Pine. At the point where the discovery was made the lead is 4 feet in width on the surface, but in the Black Tail it ranges from 6 to 8 feet.——The Belleville G. M. Co. of Spokane owns the Independent and Buffalo claims, on the north side of the east fork of the San Poil river, at Bodie camp, opposite the Gold Ledge of Gold hill. A shaft is down on the Independent. The vein is 15 or 16 feet wide. A pay shoot 3½ feet wide was discovered some time ago, but work was discontinued and transferred to the new shaft. The pay shoot produces a concentrating ore, carrying $6.10 in gold, thirteen ounces of silver and 2% lead.——Favorable reports come from the Mountain Lion. Twenty men will be added to the working force. The drift from the tunnel is in 153 feet, with ore in the face.——A 20-inch vein is exposed on the Flag Hill where the recent surface work was done. Work is now in progress on the crosscut tunnel, driven to cut all the leads on the property.——A ledge has been uncovered on the Stray Horse after two days' work by two men. The Stray Horse belongs to the Mountain Lion system.

WISCONSIN.

The New Deal Land & Zinc M. Co. has sold its mine west of Sullsburg for $45,000, the original owners retaining one-sixth interest. Options were also taken on the Raisbeck mine for $100,000 and on the Gritty Six mine for $75,000.

FOREIGN.

BRITISH COLUMBIA.

Men are working on the Alma, near Hosquoit, on the water front. It is copper ore and is from 50 to 160 feet in width.

Saunders, Waters & Foote are owners of a claim on Esperanza inlet, Nootka sound. The ledge, which is on the water front, is traceable for 3000 feet and varies in width from 20 to 25 feet, with a paystreak 8 feet assaying from $15 to $25 in gold, silver and copper.

At the Wonderful mine near Nelson a strike was recently made in an unusual manner. The request of a miner for a lease on a certain portion of the mine led Supt. Davis to investigate an old drift, in which was a large quantity of dirt and rubbish. This was cleaned out and a point was reached where the lagging along the drift was fastened with spikes. It was opened and it was found that ore had been stoped at the side of the drift three timber sets high and 13 feet wide. The sills rest on vein matter and ore. The stope had been partially filled with dirt, which had apparently been wheeled in. They have taken out two carloads of shipping ore which was found hidden in the stope. Average assays show it to carry 138 ounces silver and 76% lead.

The annual report of the Minister of Mines of British Columbia shows the total production for all years up to and including 1898 to have been:

Gold, placer	$ 59,960,819
Gold, lode	6,501,906
Silver	9,676,901
Lead	4,049,199
Copper	1,395,841
Coal and coke	40,3 6,160
Building stone, bricks, etc.	1,500,000
Other metals	26,500
Total	$123,417,326

Kaslo *Kootenaian*: At the Dundee, Ymir district, carpenters are repairing the damage done by fire. The hoisting plant was put into running order last week and both mine and mill will soon be in operation.——The Spotted Horse mine on Round mountain is being developed.——Rock has been brought into Ymir from the Bonanza and Council Bluffs claims on Hughes creek, seventeen miles from Ymir. The owners are W. Brenan et al.——The owners of the Wilcox and Bywater, seven miles up Wild Horse creek, will incorporate. The new company will be known as the Broken Hill Mines.——Work has been commenced on the Vermont, Rover creek. There is 6 feet of ore on this property.

Spokesman-Review: The tunnel on the Shannon-Dolphin group in Camp McKinney has cut the vein, showing 3½ feet of quartz, impregnated with galena and iron.

Rossland *Miner*: D. McIntosh, Pres. and Gen. Mgr. of the Winnipeg M. & S. Co., of Wellington camp, in the Boundary Creek country, says: As soon as the Canadian Pacific railway is ready to receive ore from the Boundary Creek section there will be a large tonnage available. There are ten mines in that section which will be ready to market ore. Among the mines that will ship is the Winnipeg. There is considerable ore on the dump, and we will have 5000 or 6000 tons of ore. A seven-drill compressor has been purchased for the Winnipeg. The plant includes an 80 H. P. boiler, a compressor and three drills.——The Iron Mask - Center Star case has come to an end for the time being, and the experts have left Rossland.

CANADA.

New England *Statist*: A syndicate of American and Canadian capitalists has been formed to erect works for the refinement of ores. The plan is to form a company with a capital of $2,000,000, with power to increase to $5,000,000. The company will build a smelter and refinery and will be prepared to treat the copper ores of British Columbia.

MEXICO.

Denver *Republican*: The Velardina M. Co. is operating the silver mine at Velardena, State of Durango, Mex., said to be one of the largest mines in that country. It is equipped with a smelter having six furnaces, and the daily output of the mine is 225 tons. The mine has paid dividends for several years.

NEW ZEALAND.

London *Mining Journal*: The quantity and value of gold entered for duty for export from New Zealand from April, '57, to Dec. 31st, '98, shows a total of 13,845,727 ounces, and a value of £54,453,325. The quantity entered for export during the quarter ended December, '98, was 77,502 ounces, valued at £299,142.——Work, after a lengthy period of suspension, has been resumed on the Waihi mine, and the machinery had no difficulty in unwatering it. Driving is in progress; £8000 is the working capital available. It will take an additional £30,000 to thoroughly explore the area of ground held by the company.

Mine Foreman Desires Position.

Competent and reliable Understands development work, drafting, assaying. Speaks Spanish. References. Address Box 834, Los Angeles, Cal.

WANTED—2000 FEET 4-INCH WROUGHT IRON PIPE.
Must be in good condition.
Address DYER BROS., 119 Beale St., San Francisco, Cal.

WANTED.

Competent Diamond Drill Man

WHO CAN SET HIS OWN BITS.

Apply, stating experience, references, etc., to MOUNTAIN COPPER CO., Keswick, Cal.

WANTED

By a Practical Mining Man,

A GOLD, SILVER OR LEAD PROSPECT ON WORKING BOND.

Must have ore shoot in sight. Vein must be of moderate size and shoot of moderate length. Address VIRGINIA CITY, care of Mining and Scientific Press.

WANTED.

A First-Class Mine Foreman for Development Work in the Northwest.

Must be a good all-round miner in shaft sinking, timbering, tool sharpening, handling men, and strictly sober. Young or middle-aged man preferred. Give experience references, pay wanted and full particulars. Address ROX, care Mining and Scientific Press.

Gold and Silver Mines to Locate.

A man of experience and integrity will locate for a company a group of promising prospects in Nevada, in an old camp where many prosperous mines have been opened, on fair terms all round. Reference given. Address PROSPECTOR, care Mining and Scientific Press.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

FOR SALE.

A GOOD GRAVEL MINE.

TITLE GUARANTEED.

Tunnel between 3000 and 4000 feet long. Mine paid over 200 ozs. for February and March. Purchaser may examine property. For further particulars, address CHARLES HENITZEN, Forest City, Sierra Co., Cal.

Mining Properties,

Prospects and Partially Developed Claims at Low Figures, Near Good Ore Market.

Also a 50-foot ledge, developed. Ore runs $4 and upwards; free milling. Can be quarried. Water right accompanies.

J. N. ROSA, P. O. Box 5, Shasta, Cal.

DIAMOND DRILL FOR SALE,

OR CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE IT.

Apply to J. A. MURRAY, care of Risdon Iron Works, San Francisco.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MacBETH, Equitable Building, Denver, Colorado.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.

ELECTRICAL DEPARTMENT: Theory and Practice; Construction.

BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.

Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

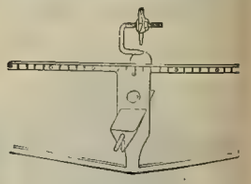
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.



The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

Wm. Ainsworth & Sons,
(Successors to WM. AINSWORTH.)
DENVER, COLO., U. S. A.

THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

Market Reports.

SAN FRANCISCO, May 11, 1899.

SILVER.—London, 28¾d; New York, 61⅞; San Francisco, 61; Mexican Dollars, 48¾. New York exchange, sight, 5; telegraphic, 7½ cents premium.

LEAD.—New York reports steady, $4.40 bid, $4.45 asked; brokers' price, $4.25.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 7c; bar, 7¼c.

COPPER.—New York reports Lake dull at $19.; brokers' price, $19; mill copper plates, 23¾c.

There is nothing of particular interest in copper this week. The price has fallen slightly, but the market is in practically the same condition as last week. Dealers are doubtless watching the effect the Amalgamated Copper Co. will have on the metal.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12½@13c per pound.

TIN.—Pig, 31c per lb.; Bar, 35c. New York reports firmer, $25.30 bid, $25.40 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $42; export, $38.50 @39; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

RED LEAD AND LITHARGE.—One ton and over, at one purchase, 6¼c; 500 lbs. and less than one ton, 6½c; less than 500 lbs., 7c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd.	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 32 @ 33c per lb.; carloads, 30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5¼c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6¼c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

OILS.—California Castor, pure, cs., $1.08 per gal.; bbl., $1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.15; less than 200 gals., $1.10; in bbls., 4c per gal. less than case; Baker's Crystal, $1.40; China Nut, 50c; Linseed, strictly pure, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17½c; Astral, 17½c; Star, 17½c; Eocene, 19½c; Extra Star, 21½c; Elaine, 22½c; Water White, bulk, in tanks, 11½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c.

Silver-Plated Amalgamating Plates for Saving Gold in Quartz or Placer Mining.

The superiority of silver-plated copper plates, for amalgamating in mills and sluices, is generally admitted, and in recent years there has been an ever-increasing demand for these plates, particularly where the fineness of the gold made its saving somewhat difficult on raw copper plates. The difficulty found in securing properly annealed copper plates for use on amalgamation tables is well understood by mill men, and the constant care necessary with the ordinary raw copper plate is also well known. The silver-plated plate requires much less attention and saves as closely, if not closer, than raw copper. The best amalgamating surface is undoubtedly that covered with gold amalgam and the next best is silver. As it is very expensive to have a copper plate coated with gold before use in the mill, silver-plated plates have been substituted in their stead and with the most satisfactory results. When cleaning up plates it is not the best plan to attempt to remove the last bit of amalgam, as that which is allowed to remain—the much-desired gold amalgam—will facilitate the saving of gold on the following run. One of the principal dealers in silver-plated copper plates for gold saving is E. G. Denniston of Denniston's San Francisco Plating Works, 653-655 Mission St., San Francisco. The silvered-copper plates for the large Alaska mills have been furnished by this establishment. In the manufacture and preparation of plates of this description only the best annealed Lake copper and refined silver are employed. They are made in any size, plain or corrugated. In addition to mill plates, the San Francisco Plating Works also manufacture gold, silver, platina, nickel, brass, copper and bronze plating of all descriptions.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1899, an assessment (No. 13) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the fourteenth day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

BADGER HILL AND CHEROKEE GRAVEL MINING Company.—Location of principal place of business, San Francisco, California; location of works, Cherokee, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of May, 1899, an assessment of Three Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1899, an assessment (No. 18) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 17th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of May, 1899, an assessment (No. 13) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April 1899, an assessment (No 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMAMS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of April, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 106 Leidesdorff street, San Francisco, California, on MONDAY, the 29th day of May, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. H. Adams in the Gold Bug Mine, near Clipper Mills, Butte Co., to deposit tailings in Grizzly Creek; from John McCollum in the Santa Rosa Placer Mine, in Mohawk Valley, Plumas Co., to deposit tailings in Sulphur Creek; and from the Plumas Development Co. in the Yankee Hill Mine, near La Porte, Plumas Co., to deposit tailings in St. Louis Ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on May 15, 1899, at 1:30 P. M.

DELINQUENT SALE NOTICE.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 20th day of March, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
C. Rehn, balance	77	1,000	$90 00
G. F. Volz	84	1,000	100 00
G. F. Volz	85	1,000	100 00
G. F. Volz	86	1,000	100 00
J. J. S. Fey	13	500	50 00
F. Baltz	123	500	50 00
F. Baltz	140	500	50 00
S. T. Bernhardt	182	500	50 00
G. F. Schwarz	151	66	6 60
C. Mayer	171	500	50 00
C. Mayer	172	500	50 00
C. Mayer	177	500	50 00
C. Mayer	178	150	15 00
C. Smyth	222	60	6 00

And in accordance with law, and an order from the Board of Directors, made on the 20th day of March, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, 773 Mission St., San Francisco, California, on THURSDAY, the 1st day of June, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

MEETING NOTICE.

NOTICE OF ANNUAL MEETING OF STOCKholders of Jamison Mining Company. Principal place of business, 120 Sutter Street, San Francisco. Works on Jamison Creek, near Johnsville, Plumas County, California.

In accordance with the by-laws of said company, the annual meeting of the stockholders of said Jamison Mining Company will be held at the office of the company, Rooms 50 and 54, 120 Sutter Street, San Francisco, California, at 2:30 o'clock P. M. on MONDAY, the 15th day of May, 1899. By order of the Board of Directors.

SAM. W. CHEYNEY, Secretary.

Dated April 14th, 1899.

NOTICE.

SALE OF THE BUNKER HILL AND MAYflower Mines, Amador, Amador County, Cal., by the Receiver of the Spring Garden National Bank of Philadelphia, Pa.

Public notice is hereby given that the mining properties known as the Bunker Hill and Mayflower Gold Mines, situated near Amador, in the County of Amador, State of California, on what is known as the "mother lode," belonging to this trust, will be sold at public auction, together with all water rights and privileges, mill sites, hoisting works, railroads and rolling stock, buildings, machinery and appurtenances belonging thereto, at the United States Custom House, San Francisco, California, THURSDAY, June 8, 1899, at 11 o'clock A. M.

Circulars containing general description of the property and particulars as to conditions of sale etc., furnished on application to

J. FRANK ALDRICH, Receiver,
Room 33, Wyatt Building,
Washington, D. C.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the NATIONAL CON. MINING CO. will be held at the office of the Company, 773 Mission St., San Francisco, California, on MONDAY, the 5th day of June, 1899, at the hour of 8 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

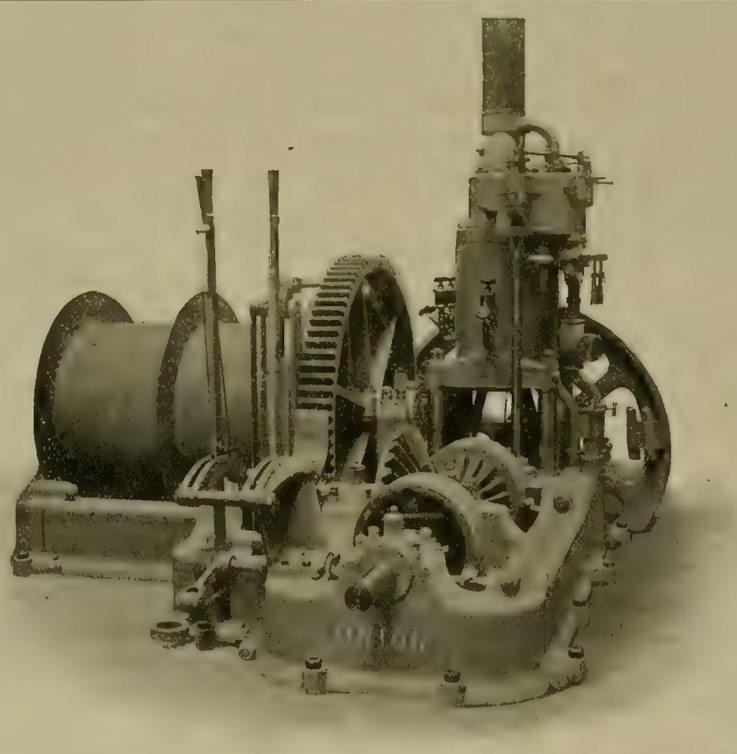
No. 2028.—VOLUME LXXVIII. Number 20. SAN FRANCISCO, SATURDAY, MAY 20, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A New "Union" Hoist.

The accompanying engraving illustrates the latest type of gasoline hoist, recently built by the Union Gas Engine Co. of San Francisco, Cal., for the Moctezuma Copper Co., to be used at Nicosari, State of Sonora, Mexico. In order to get a hoist of this size and power to the mine it was necessary to make it in sections, the weight of any section not to exceed 360 pounds.

The engine is of their latest design and has all the recent improvements. It is of the double cylinder vertical type and has a very sensitive governor and also a controller. This attachment, in conjunction with a double cylinder, enables the load to be hoisted very steadily, without any jerky motion. The drum is of the two-compartment type, so arranged as to be reversible. It is to be operated at a double compartment shaft, lifting from one side while lowering in the other, thus permitting continuous hoisting to be done—lowering is therefore done by power, not by brake, and the weights of cages are balanced.



GASOLINE HOIST BUILT FOR THE MOCTEZUMA COPPER CO., NICOSARI, MEXICO.

This hoist is 25 H. P. and its capacity is one and a half tons raised 165 feet per minute vertically. All levers are so situated as to enable the operator to have perfect control of the hoist without changing his position. An examination of the post brake shows it to be both reliable and powerful, and with such leverage as to fully control the load without the operator being obliged to use any extra exertion.

This company has been very successful in the manufacture of engines for hoisting purposes. They are now making plans for a double drum hoist of 130 H. P. to be used sinking 1000 feet, and another plant of about the same power to be used at a shaft that is expected to go down 2000 feet.

Mining men in all parts of the world are carefully watching the development of the gasoline engine for mining purposes, and judging from articles that have appeared in the various journals devoted to that industry it is the opinion of users of this power that it has come to stay.

Two Prominent Southern California Gold Mines.

The Good Hope mine and mill which are illustrated by the accompanying engraving are four miles southwest of Perris, in Riverside county, Cal. The mine has an interesting history and has had several owners. Originally worked successfully by Mexicans who crushed the quartz in arrastras with good profit, it later came into the hands of a New Mexican miner who worked it successfully, it was claimed, for several years. It then passed to a corporation, which inaugurated an active but extravagant policy, and the mine came into disrepute. After an idleness of several years and some litigation, the property is now being worked profitably by leasers, it is said. The tailings are being cyanided with good results.

The companion illustration is that of the Rose mine, situated in San Bernardino county, Cal., at an altitude of 7200 feet, and is one of the highest successful gold mines in the State. The high hill back of the works is composed almost wholly of limestone, and from its summit one may look down upon the broad, heated expanse of sand, rugged mountains and dry lakes called the Mojave desert. The Rose mine is seventy-five miles from the railroad, but this fact does not seem to have proven a detriment to its successful operation. The ore shoots occur in limestone and mica schist, the vein being accompanied by a granite dyke. The ore is hematite, sometimes massive, but usually disseminated in scales or in fine dust-like particles in the limestone.

GOOD HOPE MINE AND MILL, NEAR PERRIS, RIVERSIDE CO., CAL.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gasoline Hoist Built for the Moctezuma Copper Co., Nicosari, Mexico; Good Hope Mine and Mill, near Perris, Riverside Co., Cal.; The Rose Mine and Mill, San Bernardino Co., Cal., 529. Latest Mining and Metallurgical Patents, 535. A Road Built by Water Power in San Bernardino Co., Cal., 536.

EDITORIAL.—A New "Union" Hoist; Two Prominent Southern California Gold Mines, 529. The Mine Boomer Not a Necessity; Little Use to Sound Warning Notes; The Miner Follows the Soldier; Large Storage Reservoirs in the Mountains; Miscellaneous, 530.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 532–39–40.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 554.

MISCELLANEOUS.—Concentrates, 531. The Adjustment and Control of the Stamp Mill, 532. Some Notes on the Petroleum Deposits of California, 533. Some Characteristic Mines of the California Gold Belt; Liquid Air and Its Possibilities; More Light in Greater America; Shipping Ore from Maine to Colorado, 534. Latest Mining and Metallurgical Patents; The Future of Zinc, 535. Water as a Road Maker; Some Notes on the Geology of Leadville, Colorado, 536. Personal; Books Received; Catalogues Received; Recent Mining Incorporations; Industrial Notes; Recently Declared Mining Dividends; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 540.

THE Japanese are giving unusual attention to gold mining, and the silver mining industry is more active than ever before.

THE copper situation is practically unchanged. There are slight fluctuations in price, but the figure is substantially unchanged.

THE situation at Wardner, Idaho, is still quiet, under military rule. It is currently reported that the union miners will not take out permits, as required by the military regulations. It was not expected that they would.

ALL mines have a beginning, and all great mines are made—some faster than others, it is true; some require much more capital than others. The largest and most successful mines in the United States were small affairs in their early history.

A CONDITION of great unrest prevails in the Transvaal, South Africa. When the political affairs of that republic will become settled it is difficult to predict; but the present condition necessarily retards the more rapid advancement of the development of the country.

THERE have been reported recently an unusually large number of accidents in California mines. These accidents were from a variety of causes, and in some cases were fatal. There seems to be an insufficient safeguard for the protection of the men working underground.

THE rush to the new gold fields at Cape Nome will doubtless draw heavily on the surplus population of the Yukon river fields, whether there is sufficient gold in the Cape Nome country to justify a stampede or not. These reported "rich strikes" in various parts of the great Northwest will have the effect of gradually opening the country, and, whatever the result may be in gold, it will at least be the means of furnishing an extended knowledge of what has heretofore been a vast wilderness, the resources of which were practically unknown.

THE mine boomer is not an absolute necessity in the great industry, for it could exist without him. He does some harm, perhaps, and he also does some good. He tells extravagant stories about veins of enormous width and fabulous richness, indulging in the grossest exaggeration; but he probably does less harm than some others, for no one believes him—at least, very few do. Some of the prospectuses issued by newly-created mining companies are very interesting, as they frequently make statements of the most surprising character. One which was recently noticed asserted that the mine which the company proposed to develop was situated on a hill 1000 feet above the neighboring stream. A tunnel had been run in, gaining 7 feet in 3; the vein was 130 feet wide and the claim 3000 feet long. The ore was worth $18 per ton, and could be mined and milled for 80 cents per ton. The proposition was simple enough: The entire length of the claim 3000 feet, the vein 130 feet wide, and the depth to which it could be worked by tunnel, it was stated, showed in sight 30,000,000 tons of ore, worth, net, $17.20, or say $15. This latter was a liberal concession, cutting off a net revenue of more than $60,000,000 to which the stockholder is rightly entitled, and it suggests that in making such unreasonable discounts that some one was foresighted enough to make at this early stage of proceedings plans to absorb the $2.20 per ton. This is such a vast undertaking that people of ordinary means will probably be rather slow about taking stock in the enterprise.

WHEN the gold fever takes possession of a man there is little use to sound warning notes. That feverish unrest which comes with a desire for adventure unfettered by the chains of civilization, with a view of a possible sudden fortune—all in gold—to lure the victim on, takes such a firm hold upon him that, having made up his mind to go, he rarely gives it a sober, earnest thought, but rushes headlong for the new gold fields, fearful he may be too late. Thousands join the stampede, but the percentage of fortunate ones is always small. Many never return. Time after time the civilized races of the world have shown that no danger is too great, no hardship too severe, to deter them from venturing into a new gold field. The scorching sands of Australia have claimed thousands of victims; the beautiful valleys of California, too, are not without their share. The adventurers will go as high as they can work, and toil, and live, after gold. And now there is every reason to anticipate another rush to the very rim of the Arctic circle. The new discoveries at Cape Nome are, in some respects, somewhat more favorably situated than the Klondike region, being close to the coast and comparatively easy of access, and on this account the numbers going to that field will be greatly increased. The climate, however, is said to be far more rigorous than on the Yukon. There is no mountain range to break the force of the high winds which prevail, and their damp, penetrating force will be severely felt by the thousands of adventurers who tempt fortune in that icy land.

THE raise in the price of copper and zinc has done much to attract capital into the channels of mining. Men who heretofore looked upon mining as a speculative business, too risky for investment, are learning that the great success of the largest mining enterprises is due to careful, close business management—as careful and as conservative as that which characterizes successful industrial enterprises in this country. A thorough investigation of the possibilities of mining, with due regard for its uncertainties, will soon convince most men that legitimate mining is as much a safe business as other enterprises, and not a lottery at all.

THE question of the right of an original locator to relocate a mining claim upon which he has failed to perform the amount of assessment work, or to place an equivalent in improvements, as required by law, is an important one. This question came up before the Supreme Court of Utah and the court decided that an original locator had such right. It is a recognized fact that a prior locator may renew his location by resuming work. While the court in this instance recognized the right of the prior locator to relocate, it should be understood that it also requires that assessment work should not only be resumed but completed in order to assure possession.

IT is now stated that the flotation of the Amalgamated Copper Company stock was not such a grand success after all, as the promoters were obliged to absorb a large part of the $75,000,000 themselves. It is stated in New York that the actual legitimate demand for the amalgamated stock does not exceed one-half of the amount offered.

THE slight fluctuation in silver seems to indicate that nothing unusual is in progress that has a material influence on that metal. After a sudden rise two weeks ago, and a subsequent decline, it is again quoted at somewhat higher figures, but a fraction lower than the highest point reached previously.

The Miner Follows the Soldier.

It is interesting to see how closely the min treads upon the footsteps of the soldier. In rece years, in almost every instance, where new regio have been invested by civilized armies, the adve turesome army of prospectors was right at t soldier's heels. The London *Mining Journal* says:

Hardly had the Sirdar completed the pacificatic of the district round Omdurman, than he, or the a ministrative office of which he is for the present t titular head, was besieged by applications for gran and concessions, both agricultural and minin Speculators rushed in with a precipitancy whi argued the expectation of considerable wealth some of the reconquered districts, and they are r ported on reliable authority to be not a little d gusted at the hesitancy by which, as the result o prudent administrative policy, their bountiful d mands were confronted. With due regard to t interests of the Government, it was impossible grant off-hand, almost before the smoke of the b tle had been laid, the multitudinous demands whi at once poured in, and all but those who had be directly affected, and who in guilelessness of hea had imagined that no sort of opposition would offered to their demands, will be disposed to recc nize the political necessity of some restriction to t creation of wholesale land rights in a country whi has so recently passed again into the hand of t Egyptian Government. No objection has be offered to the letting of land, but it is direct pu chase that the Government officials for the pre ent set their faces against, until something mo has been done to ascertain, on the one hand, wh is likely to be the particular commercial destiny these comparatively new territories, and on t other, what land may be required by Governme for their own purposes. On the part of the app cants for concessions it is objected to this that lease is not a sufficient security of tenure to warra the expenditure necessary to production; but t answer to this is not far to seek. In the first plac it is in a high degree improbable that, once definite settled, the holders will ever be disturbed for an thing short of an actual pressing political necessit and it is, moreover, not altogether unreasonat that those who seek to be the first gainers by t enterprise of the Egyptian Government should willing to be bound by the limitations which a necessary to the effective administration of the n covered provinces.

The conquest of the Philippines is not yet cor pleted, but no one doubts it soon will be, but ev now is heard much talk of the mineral wealth those islands in the South Seas and the soldiers wi no doubt, if given an opportunity, themselves tu miner.

CALIFORNIA needs large storage reservoirs in t mountains, reservoirs of such size as will afford abundant supply of water throughout an entire yea There are numerous reservoirs and lakes, but tho in use are too small, as has been demonstrated ye after year. The mining industry in this State ca never reach its highest perfection so long as ea summer and fall season sees a shortage of wate The mining industry has demonstrated its perm nency and the large water supply will be need more in twenty or thirty years than now. The lar electric plants already installed must have a conti uous supply of water, and if each summer is to s this supply limited, industrial enterprises can fi no assurance that they can have power continuousl Already the great dam and canal on the Americ river above Folsom are proving insufficient. Mo power is demanded and, although there is a vast vo ume of water in the American river in spring a summer months, each fall season sees the river lo There are numerous basins in the Sierras, whe great reservoirs could be safely constructed, a also some natural lakes, which would afford an abu dant supply to certain localities. Enterprises su as suggested require large capital, but the inves ment would not be an unprofitable one.

THE rainfall in California this season, while su plying an abundance of water for present needs, evidently not sufficient to afford a full supply lastir until next winter's rains, and unless more rain fal somes mines will undoubtedly be obliged to clo down in the fall.

THE introduction of the dime and nickle-in-the-sl telephones is said to have been due to the desire the part of telephone companies to collect toll fro those who made a practice of borrowing the use telephones paid for by the month.

Concentrates.

KAOLIN is an aluminous silicate derived from the decomposition of feldspars.

TO FIND the greatest square in a given circle, multiply the diameter by .7071.

SALT lands are classified as mineral and are reserved from railroad grants.

THE essential constituents of granite are orthoclase (potash feldspar), quartz and mica.

AN electric motor is a machine for converting electrical energy into mechanical energy.

THERE are manganese and chrome mines on Cedar mountain, near Livermore, Alameda county, Cal.

THE Calumet & Hecla copper mine at Houghton, Mich., is said to be netting over $1,000,000 monthly.

SILVER sulphide may be chloridized in the pan by the addition of sodium chloride and copper sulphate.

A NUMBER of so-called boiler compounds are manufactured to prevent the formation of scale in boilers.

WHERE two veins unite in depth the location first made takes all of the ore below the point of junction.

TO FIND the diameter of a circle equal in area to a given square, multiply one side of the square by 1.12838.

ONE of the greatest sources of litigation is the extralateral right granted under the laws of the United States.

COMPRESSED AIR power cars are being successfully operated on the Metropolitan street railway in New York City.

THE greater part of the largely increased copper output of the United States is being absorbed by the domestic demand.

A BUILT UP wooden beam is no stronger than a solid beam of the same size provided the solid beam is perfectly sound.

THE laws do not permit the location of mineral or other claims on any Government reservations, whether military, forest reserve, or Indian.

PITCHSTONE is a vitreous variety of trachite or rocks of felsitic type. Pitchblende is uranium oxide, which is gray, brown or black in color.

A DYNAMO is described as a machine for converting mechanical energy into electrical energy. Generator is the name often applied to a dynamo.

CHALCOCITE (copper glance) is a copper sulphide containing 79.8% copper, and sometimes silver-bearing; color and streak blackish lead gray, dull.

GRANULITE is a fine granular rock composed of quartz and orthoclase or microcline. It usually contains small garnets which appear as brownish rounded grains.

IN soldering joints in copper wire, the lowest possible heat should be employed, for the reason that copper is softened by heat and loses strength in consequence.

THE quantity of feed water required for a good, economical engine is 30 pounds per I. H. P. per hour. A good condenser increases the efficiency of an engine 25% to 40%.

WOLFRAMITE (iron tungstate) was named years ago by Cornish miners "call" or "mock lead," for the reason that its great weight led them to believe it contained lead.

PYROLUSITE is manganese dioxide or black oxide of manganese, containing manganese, 63.2%; oxygen, 36.8%. Sometimes crystallized but usually massive. Hardness, 2 to 2.5.

GEO. F. BECKER said very tersely in a discussion of certain legal problems affecting mines: "The difference between scientific and judicial geology has long since been recognized."

A GOOD automatic, non-condensing steam engine requires from 3 to 4 pounds of coal per H. P. per hour. An automatic condensing engine requires from 2¼ to 3⅛ pounds per H. P. per hour.

GREISEN is a granular crystalline rock consisting of quartz and mica, usually lithia mica. Quartz is the predominant mineral. Cassiterite (tin stone) is often found associated with greisen.

CRYOLITE is a white to translucent mineral and resembles ice. It is an aluminous-sodium fluoride. It contains, alumina, 13%; sodium, 32.8%, and fluorine, 54.2%. It may be fused in the flame of a candle.

A NOMINAL H. P. is theoretically 33,000 foot pounds per minute. That is, a horse is supposed to be able to lift 33,000 pounds 1 foot high in one minute. It is an unsatisfactory manner of measuring power.

THE specific gravity of sphalerite (zinc blende) is 4.046 and that of galena is 7.586. While the lead sulphide is nearly twice as heavy as the zinc ore, they are most difficult to separate by mechanical devices.

PSILOMELANE is manganese dioxide, having a black or greenish black color, and a reddish to brown streak. It varies in composition, often contains baryta or potassa. It is an abundant ore. Hardness, 5 to 6.

IN gasoline engines the consumption of gasoline should not exceed one-tenth gallon per indicated horse power per hour. For a 20 H. P. engine the consumption should not be greater than two gallons per hour.

THE overflow from hydraulic separators should be passed over canvas or other tables having a grade suited to the material under treatment and a quantity of water adjusted to the requirements of the case.

THE laws of '66 did not require that end lines of mining locations should be parallel, but the law of May 10th, '72, makes this necessary in order to obtain the right to follow the vein on its dip outside of the side lines.

THE geological phenomena incident to a successful artesian well are not the same as those of an oil well. An artesian well will not flow unless the source of the water is at a higher level than the outlet of the well.

QUARTZ MILLS built upon flat surfaces instead of rock terraces should have the rock breaker set on timbers detached from the main structure, as the vibration in time is the occasion of much damage to the building.

GRANITITE is the name applied to those varieties of granite which contain plagioclase (soda, lime, feldspar). The orthoclase in these rocks is red and the mica which occurs sparingly is a blackish green magnesian variety.

SYENITE is a crystalline granular rock which contains from 55% to 60% silica and in the typical varieties consists of orthoclase feldspar and hornblende. This is the syenite of Werner, but it is a comparatively rare rock.

IN Moniteau county, Missouri, the coal veins developed in the mines are intersected by thin seams of galena and zinc-blende, filling joints in the mass of coal which in mining are saved, and occasionally a shipment of ore is made.

AN ore containing gold in native state and subject to amalgamation should be crushed only so fine as may be necessary to free the scales or particles of gold, and no finer. Further pulverization is unnecessary, and entails useless expense.

APPROXIMATELY every foot of elevation of a column of water will give a pressure of one-half pound per square inch. Thus a pressure of 200 pounds on a gauge would indicate a vertical height of the column of water to be about 400 feet.

THERE is no law prohibiting ground sluicing in California, but tailings from a mine having been worked by hydraulicking cannot be ground sluiced for the obvious reason that the very purpose for which the dam was constructed is defeated.

GALVANIZED IRON or steel ropes should never be used for running ropes. A single day's use causes the zinc coating to fall off, and the rusting of the rope then proceeds rapidly. Hoisting ropes made from poor steel are inferior to good iron ropes.

COLORADO claims to have produced up to Jan. 1st, '99, in gold, silver, copper and lead $620,974,211.46. The total production of the State of these metals during '98 was $42,646,343.95. At this rate within ten years they will have passed the billion dollar mark.

THE amount of assessment work on a claim is determined, not by the kind or quantity of rock removed, but by the amount of time required to perform the work, basing it upon the rate of wages paid for such work in the camp or district where the mine is situated.

THE theoretical loss in operating an air compressor at a point above sea level is computed to be at 1000 feet altitude 1.6%; at 2000 feet, 6%; at 3000 feet, 8.9%; at 4000 feet, 11.9%; at 5000 feet, 14.1%; at 6000 feet, 17.2%; at 7000 feet, 19.8%; at 10,000 feet, 27.3%.

HUBERNITE is a tungsten mineral near wolframite in composition, but containing 20% to 25% manganese oxide. It occurs in bladed forms usually and rarely in crystals. In color it is brownish red to hair brown to almost black. The streak or powder is yellowish brown to greenish gray, often translucent.

MONAZITE is a phosphate of cerium, lanthanum, yttrium and didymium. It is employed in the manufacture of the thin gauze mantles used on gas burners. When heated to a high temperature, as is the case in the Bunsen burner of the gas lights referred to, it gives out an intensly white brilliant light.

NARROW MORTARS in a stamp mill hasten discharge, but scour the inside plates. Mortars should be cast broad enough and deep enough to admit being lined with iron plates, which, upon wearing out, may be replaced by others, thus greatly increasing the life of a mortar and saving the expense incident to its earlier replacement by another.

THE passing of gravel, sand and cobbles down Coyote creek in Calaveras county, below Vallecito, at the time the hydraulic mines of that locality were worked extensively, cut down into the limestone bedrock in places 3 to 5 feet in a few years, showing the erosive effect of a stream having a heavy grade and carrying a large amount of solid material.

FLUORITE (fluorspar) is calcium-fluoride. It occurs at Cripple Creek associated with telluride ores, and causes the color of the so-called purple quartz. It occurs commonly in deposits of lead ore and is the mineral known to Cornish miners as tiff. It crystallizes in cubes most commonly, is soft and easily scratched. Its color is white, red, green, blue, purple, and often yellow of light shades.

WHERE A owns a patented placer claim B cannot go upon it and locate water, no matter how long disused. If a water right was at one time taken up on A's claim, and the water has not been used at the point to which it was originally taken or elsewhere, the water may be relocated at some point below or above A's claim under the laws governing the relocation of water rights.

FOAMING in boilers is caused by interference with the free escape of steam from the water in the boiler, and is usually observed in the water gauge by the rising and boiling of the water in the gauge, and also by water in the steam. The foaming is due to either of three causes—mud or other suspended matter in the water, the presence of sodium salts and organic matter. Mud and organic matter may be removed from the water by filtration, but to get rid of the sodium salts is impossible.

WHERE more than one vein occurs within the boundary lines of a claim the owner has the same extralateral rights as on the original discovery vein. Where veins pass outside of the side lines of the claim there is some difference of opinion as to where the extralateral right shall cease, whether at the point of intersection with the side line, and from that point extended downward along the vein in a line parallel with the end line, or whether the vein may be followed to a line projected outward from the end line.

THE definition of the term lode is various. Different authorities give different definitions. One definition is: "A somewhat continuous, unstratified, metal-bearing vein." Another is: "A metallic vein; any regular vein or course, whether metallic or not." A third definition is: "A metaliferous deposit, having more or less of a vein-like character—that is, having a certain degree of regularity, and being confined within walls." A lode is a mass of rock of any character whatsoever having continuity longitudinally and which contains precious or other metals and which extends downward into the earth. The definition should apply to all rocks, whether stratified or massive. The walls need not be regularly or sharply defined. Where, however, the outline of the lode is not sharply defined and the mineral-bearing formation is broad, "zone" is a better term than "lode."

MICA is an aluminous silicate and is usually transparent, colorless to dark wine color. It is very refractory in fire. The variety of gypsum (calcium sulphate) known as selenite resembles mica in being colorless and occurring in sheets, sometimes of considerable size. They may be easily distinguished. The clearest sheet of selenite turns chalky white under a low heat. Satinspar and alabaster are other varieties of gypsum. The gypsum minerals, when calcined and ground, become the plaster of Paris of commerce.

COLEMANITE is a hydrous calcium borate occurring in glassy crystals. It is the principal source of borax at the mines in San Bernardino county, Cal. The mineral occurs as a vein intercalated in the shales and sandstones of the Calico hills, having been formed on the floor of a Tertiary lake bed covered with sediment and subsequently tilted by geological disturbance to its present position. The rock is mined in the same manner as quartz, the workings being timbered in similar manner. The ore is shipped by wagon and rail to Alameda, Cal., where it is manufactured into borax, etc. The particular process employed at these works is not made public.

THE cassiterite found in Riverside county, Cal., occurs in a granitic formation traversed by numerous dykes of felsitic rock of dark color. The veins consist chiefly of an aggregate of fine needle-like crystals of black tourmaline. The cassiterate occurs in grains and in granular aggregates of brownish color with semi-pearly luster. The cassiterite in the Black Hills of South Dakota is found in veins of granite of coarse crystallization. The tin stone is found in greisen, in feldspar, quartz and in spodumene crystals, which occur in some of the mines in great size. Usually it is found in a mass of quartz and muscovite mica scales. The tin is black, but has a pearly streak.

OBSIDIAN is volcanic glass and results from a very quick cooling of a melted rock mass. If it cooled slowly it would develop crystalline structure and become a rock something like liparite, trachite or a rock of this type. Under the microscope, obsidian is often seen to contain numerous extremely small crystals, such as hexagonal mica plates. The black color of many obsidians is due to the vast number of small crystallites which occur as hair-like threads or rods. They have a black or dark color, and occur in such profusion as to make a mass of the rock appear jet black; but in thin sections, such as are prepared for microscopic investigation, the rock is almost transparent.

TO MEASURE WATER by means of a weir, place a board or plank in the stream at a point where a pond will form above. The length of the notch should be from two to four times its depth for small quantities of water and longer for large quantities. The edges of the notch should be bevelled toward the upper side, that is, should have the wide side down stream. In the pond, 6 feet above the dam drive a stake and then obstruct the water until it rises even with the botton of the notch. At this point mark the stake at the level of the water. Then complete the dam so that the water will all pass through the notch. When the water has settled and backed up in the pond as far as it will go, mark the level of the water on the stake. The stake can then be withdrawn and the distance between the marks will indicate the theoretical depth of flow.

WHEN the mining laws of the United States were framed the general knowledge of mining geology was not as extensive as to-day. At that time the principal fields of action were along the gold belt of California and on the Comstock. The numerous forms of irregular deposit found in stratified formations were but little known or understood. The laws very evidently contemplated a more simple condition than is often found to exist. The need for a change has long existed, but all efforts by State Legislatures to better the Federal laws have with few exceptions produced confusion and dissatisfaction. The only way in which the mining laws can be changed for the better is by drafting new laws, framed with a view to simplify matters. Geological distinctions cannot be made, for the reason that geologists will fail to agree on many important points.

THE copper belt at Butte, Montana, is 3000 feet wide at its western end at Missoula gulch and 7000 feet wide 10,000 feet east of that point. The usual strike of the copper lodes is about east and west. The ore deposits are not always sharply defined, the ore passing over gradually to an altered country rock of no commercial value. The formation in which these deposits occur is granite. The croppings in most cases consist of dark red or brownish quartz, usually containing silver and in some instances gold. Copper is not often present, having been leached out. Where carbonate of copper does occur on the surface the silver and gold values are low. The oxidized zone is usually sharply defined by the normal water line, where the free-milling ore suddenly gives place to sulphide copper ore of high grade, which with depth deteriorates in value. There are rich zones at lower levels in some of the mines. The values are always more or less variable. Manganese occurs sparingly in the copper belt but is abundant in the silver mines of the neighborhood.

IN the matter of the right of a junior locator on a cross lode to enter the lines of a prior location for the purpose of extracting the ore from the vein of the more recent location, the United States statutes say such junior locator may enter within the lines of a senior location and remove the more recently discovered vein, excepting that portion which lies within the intersection of the two veins. This seems clear, but several decisions have been rendered which make it uncertain, and in the event of a rich ore body, litigation would most inevitably follow. The court held in an important Arizona decision that "section twenty-three hundred and twenty-two gives not the lode alone, but all lodes, veins and ledges, throughout their entire depth, the top or apex, of which lies within the surface lines of the claim extended downward vertically. In other words, Congress has said to miners, comply with the requirements that we impose and the Government of the United States will grant absolutely to you a piece of earth bounded at the surface by straight lines, distinctly marked, and by planes extending through those lines to the center of the earth; and you shall have all lodes of mineral-bearing rock whose apex is within these boundaries. This is simple, plain, and the miners' rights thereunder are easy of ascertainment."

The Adjustment and Control of the Stamp Mill.*

By PROF. COURTENAY DE KALB, School of Mining, Kingston, Ont.

In submitting this paper it is necessary to preface it by saying that I am not aware that I will be able to advance a single new fact or proposition, but a discussion upon even so hackneyed a theme as the adjustments of the stamp mill may prove of some value by calling the attention of millmen anew to the importance of guarding well the minute details of practice, and of adapting their treatment to the peculiarities of the ore in which they have to deal. This may seem so obvious a necessity that the mere statement of it may strike some of you as being superfluous. But against this I must urge in my defense that it is a comparatively rare thing to find a stamp mill, either in its design or management, exactly suited to the ore passing through it, except where a mining belt yields—as sometimes happens—practically identical ores over large districts, and where some millman of judiciously investigating habit has worked out his problem for the benefit of himself and his neighbors. But ores from mines in the same district, no matter how restricted, nor how similar may be their appearance and geological setting, are very seldom identical in character. They may even vary greatly at different points in the same mine, and the millman who ignores these variations, however slight they may seem, will find fluctuations in his extraction, for which in many cases there might be a simple remedy if he knew how to determine the right one and apply it.

The first error that is usually committed in faulty accommodation of the mill to the ore is chargeable to the recklessness of the mine owner in ordering a "stamp mill" from the manufacturer. He sometimes does specify the weight of stamps he desires, without, as a rule, having the remotest idea why he wants any particular weight, except that he frequently assumes that capacity is the great thing to strive for, and he reasons that heavy stamps—if not too heavy on his purse—must necessarily be superior, forgetful that in amalgamating mills there are two different capacities to be aimed at, viz., crushing capacity and extracting capacity. The economical line between these two is the one that will be of the greatest importance to his company in the payment of dividends. But in ordering a stamp mill there are many considerations besides weight of stamps to be taken into account, such as the width and depth of the mortar, length of feed hole and character of automatic feeder, number and positions of inside plates, shape of discharge lip, slope of screens, etc. These are points which cannot be guessed at if the highest practical efficiency is to be attained. Obviously, then, a very considerable ore body should be in sight, not simply as a surface outcrop, but well explored below ground, so that its character may be fully known. The next step should be to make practical mill tests on average lots of the ore, the average involving not only value, but character of the ore. One mill test will commonly be insufficient to determine the design of mill required. If the extraction is well above 90% of the gold available by amalgamation, the test may be regarded as ample so far as the mortar and stamps are concerned. The millman should then, by careful attention to the finer adjustments, reach a very high extraction. But if the test falls below 90% of the gold which should be saved by amalgamation, samples identical with those first tested should be experimented with in another mill of different design as to details of mortar, etc. If the difference in the design of the two mills was considerable, very useful deductions may be drawn from these tests. Manifestly such testing as this is expensive, and the outlay may amount to no insignificant percentage of the cost of the mill finally ordered, but the propriety of incurring such an expense should not be judged of on that basis, but rather as compared with the loss in gold which would have gone irretrievably to the tailings dump had not these precautions been taken.

Although the design of mortar is a subject apart from that under discussion in this paper, it may be briefly pointed out that the two chief considerations are its width, measured at the discharge lip, and its depth from that line. Depth can be modified to a considerable extent by the simple device of clinch (chuck) blocks, but width is absolutely fixed. Other things remaining the same, increase of width reduces scour on inside amalgamating plates and lowers crushing capacity, or, what comes to the same thing, it lessens the discharge of relatively coarse material. Thus to some extent it increases the amalgamating power of the mill, more particularly on account of the improved efficiency of the inside plates. If the greatest possible amalgamation of gold is sought to be accomplished inside the battery, it is safer to err on the side of width than narrowness, for the millman can accomplish more by his adjustment with a relatively wide mortar. Likewise regarding depth it is safer to adopt a shallow instead of a deep mortar, for shallowness can be remedied, but its opposite imposes an unalterable condition. Depth favors fine crushing and high amalgamation at the expense of capacity.

The length of feed hole is also important. Many mortars are now made with a feed hole little more than one-third the length of the mortar. This imposes a concentration of the feed at the central stamp. This can scarcely be regarded as other than a serious mistake in mortar design. Though differences of opinion exist upon this matter, it can hardly be questioned that the central feed results in a preponderance of ore under the central stamp, and though this is soon worked off to the sides, this stamp is during a large part of the time falling a less distance with each drop, thus reducing its crushing efficiency and thereby lowering the output of the mill. The ideal condition is a uniform feed to each of the five stamps of the battery, and if the ore fed is previously reduced by rock breaker to a proper degree of fineness, so that the work of the rock breaker is not imposed upon the stamps, there should be no trouble experienced with banking of ore at the battery ends. In passing, it may be noted that, for purposes of amalgamation, the proper size of ore to be fed should be determined by experiment. Capacity is of course increased by feeding smaller stuff, and this may result in decreased saving of gold, but the remedy for this, up to a certain point, lies in those adjustments which either limit capacity, or, while hastening barren gangue through the screens, retain the gold longer in the battery. Where the gold in the free state is not exceedingly fine, such adjustments are easily possible. In any case, since the manner of feeding plays an important part in the efficiency of the stamps, there would seem to be no reason why a mill should be tied to a central feed, since central feeding can, if found desirable, be accomplished just as well through a long as through a short feed hole.

The weight of stamps, another fixed condition, should be carefully considered. The crushing power of the stamp depends partly on its weight, and also, other things being equal, on its momentum. Now there is a practical limit, which is a very narrow one, for the height of drop of heavy stamps. A lighter stamp with higher drop will acquire a momentum which will develop equal crushing capacity. While of course the element of time enters into the calculation, this sinks into comparative insignificance where the difference in height of drop is no more than 2 or 3 inches, and the greater flexibility as regards adjustability of a mill which has a possible range of say 4 inches in drop as against a mill with a range of 1½ to 2 inches is an advantage of no small consequence. An 800-pound stamp has all this in its favor over a 1000 pound stamp. There are undoubtedly many cases in which the greater weight is desirable, but the working condition of such a mill are so much more limited that its adaptability to the ore should be very definitely known before venturing thus to tie the hands of the millman. Where doubt exists lighter stamps should be chosen.

As mills are commonly constructed, the slope of the screen is also fixed. The vertical position is rarely adopted, and for a good reason. It is perhaps the crudest and least economical method of limiting discharge from the battery. Screens should be set sloping, and the angle should be capable of a certain amount of adjustment. There would be no difficulty in effecting a light seal around the edges of a screen under such circumstances, and the millman would thus be enabled to adjust his discharge to the quantity of water used with far greater nicety, giving him added control over the fineness of crushing.

The adjustments of the mill are height of drop, number of drops per minute, height of discharge, kind of screen and size of mesh, and quantity of water. The order of drop of the stamps is also a matter of importance.

The height of drop can be adjusted within certain limits, dependent upon the design of the mill. With an increase of height a longer time will be taken in falling, and a proper interval must be allowed for the rebound and settling back of the stamp before being again lifted by the cam. The speed should be adjusted to this, so that no more than the necessary interval is allowed in order that the stamp may perform its maximum duty. Prolongation of the period of rest, however, may be beneficial at times by permitting the heavier particles to settle, keeping them longer in the battery and thereby insuring a finer crushing of this material. If these particles contain gold, as is not unlikely to be the case, an increased saving by amalgamation will result. But care must be taken that such increased recovery of gold is not economically overbalanced by a reduction in total output of the mill. On the mechanical side the limits of this adjustment lie between a position of the tappet so low down on the stem as to incur the danger of "camming," and the opposite position at a height so great that the cam will not strike it until it has completed too much of its revolution, causing a risk of breaking the cam arm on account of the high speed at which the cam begins to lift the tappet. Further changes in the height of drop may be accomplished by substituting new cams designed specially to favor the object in view.

Height of discharge is to a limited extent independent of height of drop. The general practice in the best gold mills to-day is toward such a height of discharge that the stamp is never lifted entirely out of the water. This avoids any violent splashing of the pulp against the screens which not only retards the escape of the crushed ore, but occasions an undue wear of the screens. The regular pulsation of the pulp when working as above stated keeps the ore in suspension better than when the splash is violent, the coarser particles are not lifted so high above the dies, and the finer particles are afforded a superior opportunity to escape by the gentle flow of the waters over the screen surface. The resultant crushed product will be of more uniform size, and for the degree of fineness and crushing capacity sought the inside amalgamation will be higher when this method is followed. In general, it may be said that height of discharge should be increased in proportion as the ore contains other pyrites or harder portions of gangue locking up gold. On the other hand, if the "sulphurets" are of such a character as to promote "sickening" of the mercury, lower discharge will be necessary.

One of the most delicate adjustments of stamp milling operations is in the quantity of water fed to the battery. It should be uniformly distributed to the several stamps, and not delivered at one point. There should always be enough to make a pulp sufficiently thin so that the stamps may keep all of the material in the battery in motion. Any tendency to banking is fatal to good work. Addition of water beyond this point facilitates rapid discharge. If there is a considerable quantity of gold in the softer portions of the ore, thinning of the pulp will so hasten its escape that losses may be occasioned. On the other hand, if the softer portion of the ore is relatively barren an excess of water will so effectually discriminate between it and the harder ore that it will be hurried through, leaving the stamps free to do their work where it will yield the larger economical results. As a general thing, the quantity of water should be increased with greater height of discharge; but these two factors in milling should bear a relation to each other which should be very carefully determined for each individual ore in order to insure the maximum efficiency.

The slope of screen has already been mentioned. The difference of a degree will make a great difference in the rate of discharge. It will often make an even more important difference in the life of the screen. Very little dependence should be placed on the slope or the mesh of the screen for regulation of the discharge. This should be accomplished through other adjustments. The screen in a stamp mill, moreover, should not be regarded too much in the light of a sizing device. Regulation of size can be very neatly and accurately accomplished by suitable height of drop, height of discharge and quantity of water. If these are properly adjusted the screen should have comparatively little to do in sizing the pulp, serving mainly to arrest a relatively small amount of oversized stuff which has been thrown too high. This is particularly true where the stamps are set so as to drop in water instead of upon it.

Concerning the kind of screen and character of openings, opinions and practice differ widely. It might almost be said that these have changed arbitrarily, like fashions, with scarcely more justification. We have woven wire screens (the old standard), round-punched tin plate and Russian iron, diagonal slot and horizontal slot Russian iron and steel sheet, both punched and cut. The woven wire screen gives the larger area of open surface, and accordingly facilitates rapid discharge. Where the adjustments are so made as to depend least upon the screen for sizing, there can be no doubt that this is the best kind to adopt, for in such a case a very large amount of pulp thrown against its surface is presumably ready to be ejected. The flow of the pulp over a surface of this kind is also considerably retarded, which likewise promotes a free discharge. The outflowing pulp will therefore contain a relatively larger percentage of coarse material. Crimped steel wire is always to be preferred, except where the battery waters are corrosive from high acidity. Brass wire, and certain alloys, such as aluminum bronze, would then be found superior. These will absorb more or less amalgam, and the worn-out screens will ultimately be melted into bars and sold to refiners. The other forms of screen are manifestly used with a distinct view to their function in sizing the pulp. There may be cases where such sizing and restriction of discharge as they produce would prove more economical than the accomplishment of the same result by other means. The point is one to be decided with great care in each instance. The diagonal slot, ratio of open and blank areas being the same, will yield a faster discharge than the horizontal slot screens, and the cut metal will pass pulp more readily than punched or "burr" slot. It appears also that the "burr" slot is adapted only to mills where the stamps fall on the surface of the pulp, producing a violent splash. Round-punched tin plate, which is usually prepared on the ground, is rarely advisable, except as a means of using up accumulations of suitable material which would otherwise go to waste. Round-punched Russia iron is recommended by some manufacturers, and is used to a considerable extent in Australia, but the author has no knowledge as to its efficiency.

The order of drop of the stamps exercises an influ-

*Condensed from a paper read before the Canadian Mining Institute.

ence on the crushing capacity of the mill, on the amount of scour of inside plates, and on the wear of screens. For high amalgamation the order adopted most generally in the West is 1, 4, 2, 5, 3, and it is perhaps the best for all around purposes, though it has a slight tendency to crowding material somewhat away from stamp No. 1. Another good order is 1, 5, 2, 4, 3, which, however, tends to bring a slight excess of battery sands towards the middle stamps. The orders 1, 5, 2, 4, 3 and 1, 5, 3, 2, 4 both produce a very uniform distribution of sands in the battery, giving high crushing and discharging effect, at the cost of larger scour on inside plates with increased wear of screens. As an example of a bad order, 1, 4, 2, 3, 5 may be given, an order which rapidly tends to banking under stamp No. 5.

By control of the stamp mill is understood the maintenance of the same degree of pulverization, once the proper conditions have become established. Manifestly the mill must be adjusted to suit the ore, but on the other hand the ore must be adapted to the milling conditions. It is a great misfortune to have the ore which comes to mill frequently varying in character, so that either new adjustments must be made or loss allowed to take place. Such irregularities happen far more frequently than is necessary at many mines. The mine foreman can often adapt his work to the changing character of the ore (where the relative quantities of the different sorts of ore do not vary too erratically) so as to ship to mill at all times approximately the same mixture. Where the conditions of mining forbid such selective work the difficulty may be overcome, at least to an important extent, by crowding the production of ore ahead of the needs of the mill and "stocking" this in horizontal layers in large square or rectangular bins with flat bottoms. On removing the front of a bin thus "stocked" the material will fall down very uniformly mixed, so that the ore going to mill will present no wide difference in character.

To maintain the same degree of crushing it is necessary that the height of discharge lip above the die should follow the die down as it wears, which can only be accomplished by starting with chuck blocks under the screen so that these may be successively removed. The tappets will also require resetting at intervals to preserve the same height of drop of stamps. Care must be observed likewise to prevent "cupping" of shoes and dies, that is, an unequal wear, forming hollows and prominences. No mill is doing efficient service where "cupping" is permitted. The remedy, of course, exists in shifting the dies methodically so as to insure a uniform wear. There is always a tendency to slipping of tappets on the stems, which should be watched. The use of set screws for attaching tappets has been almost universally discarded in favor of gibs and keys. When properly tightened up they will rarely slip, but the danger must not be overlooked. The rotation of the stem is supposed to promote uniform wear of shoes and dies, but its importance is perhaps somewhat overestimated. Still, as stamps are made to be revolved, it is the duty of a careful millman to see that they do so, and that they do it uniformly. The number of lifts for one revolution of the stem depends mainly upon the lubrication of the cam arms, but, in general, things are assumed to be going well when one revolution is accomplished in from six to ten lifts. A tendency to a reverse rotation on dropping, if occurring with each drop throughout the revolution, indicates unequal wear of the stamp guides, which means that the stamp is not falling perpendicularly, and hence is not giving its full crushing effect. If the tendency to reverse rotation occurs during only a part of the revolution it indicates serious "cupping," which the millman should have discovered previously.

Difficulties in crushing are too commonly ascribed to some peculiarity of the ore, and the millman is thus allowed an easy escape from responsibility. The fact is that all ores crush practically alike, so long as the crushing conditions remain unchanged, granting that the material is discharged as soon as it has been reduced to the requisite degree of fineness. Bearing this in mind, it is easy for the millman to make his adjustments so as to produce the requisite results. The matter of course is complicated by the necessity of securing a high inside amalgamation of gold, and there is altogether too great a tendency to neglect the possibilities of amalgamation in the stamp mill, and resort to devices for outside amalgamation, which are frequently less efficient, and add largely to the costs of extraction. The stamp mill should be looked upon as primarily a combined crusher and amalgamator. As a crushing machine it is mechanically crude, and wasteful of power. For simple crushing there are appliances far more efficient, particularly where large quantities of ore are to be treated. But in its proper sphere the stamp mill has no rival, and the exceeding delicacy of the adjustment possible for the production of specific results will be hard to attain by any other machine.

A series of experiments were made in which the height of drop and discharge were changed. The table above shows the results of these experiments.

TABLE SHOWING EFFECTS PRODUCED BY CHANGING FROM LOW DROP AND LOW DISCHARGE TO HIGHER DROP AND HIGHER DISCHARGE IN STAMP MILLING THE SAME ORE.

Some Notes on the Petroleum Deposits of California.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS.

In a recent article in the Bulletin of the Geological Society of America Prof. Edward Orton of Ohio gives a brief resume of the "Geological Probabilities as to Petroleum."

The origin of petroleum and the conditions under which it occurs are taken up. In accordance with the views of the great majority of geologists Prof. Orton concludes that petroleum is of organic origin, derived from either animal or vegetable remains.

He argues for the importance of rock structure in determining the position of petroleum deposits, and further that the oil is formed in the stratum or rock in which it is found. That is, he believes that it does not migrate either up or down through the rocks.

It is with this last conclusion that I wish to take issue, basing my discussion upon the conditions under which petroleum occurs in California.

Beds of Tertiary age furnish almost all the oils and bitumens of California. Of the three divisions of the Tertiary—the Eocene, the Miocene, and the Pliocene—the middle one is the most important in this regard. In one locality at least the Eocene furnishes large quantities of petroleum, while very little has with certainty been derived from the Pliocene.

I shall not here try to prove that these formations are the source of the oil, but merely state that where they are absent, or do not contain the thick beds of organic origin which are so characteristic especially of the Miocene, the oil and bitumen deposits are not found.

The organic origin of the oil is almost self evident. The silicious and calcareous shales, known in general as the "bituminous shales" are made up largely of remains of sea organisms. The greater number of these are microscopic in size although the remains of fish are quite abundant. In California, then, it is chiefly due to animal remains that we have the extensive and valuable oils and asphaltum.

Now as to the local position of the deposits. The structure of the rocks appears in many cases without any doubt to determine just were the oil shall collect. This is true in California as in the Eastern States, but owing to the much greater deformation of the strata here it is impossible in many cases to determine just what the relation is. The summit of an anticlinal knob or ridge (point or axis from which the strata dip away on opposite sides) is theoretically the place for finding oil in an oil-bearing field.

In California the rocks are often closely folded and broken along the axis and the oil is found along one side of the fold instead of in the center. Sometimes the oil is found in porous strata in monoclinal folds; a monoclinal fold being a series of rocks dipping in one direction only. In such cases the anticlinal theory seems to fail.

It is however concerning the migration of the petroleum from its original source to its present position that the most unique and interesting facts come out; facts which are radically different from those which Prof. Orton has found to be characteristic of the Eastern fields. He says that petroleum migrates neither up nor down from the horizon in which it is formed.

For most regions it is undoubtedly true that water with which porous rocks are more or less impregnated would prevent the oil from passing downward. As it is lighter than water it must be forced upward unless hindered by an impervious layer. While in a region of but little disturbed rocks there is not apt to be much fissuring, permitting the escape of the oil, yet even there it seems to me the present position of the petroluem is not necessarily the original one: the one where it was formed.

Petroleum in commercial quantities is most often encountered, as we should expect theoretically, in porous rocks, such as sandstone, and must at some time have migrated from shales or limestone in which it was distilled. The movement would naturally be in the direction of least resistance: into porous rocks overlying or into fissures and seams in the rocks.

Now in California the petroleum and asphaltum deposits are frequently found removed thousands of feet from any formation in which they could have originated. The movement in most cases has been an upward one.

In the Sespe district, in Ventura county, there is a most remarkable and interesting field of petroleum. The present position of this petroleum can be accounted for only through the supposition that it has passed downward from the shales in which it originated.

In this region there is a thickness of more than a mile of Eocene beds consisting chiefly of sandstone. Near the top of the series there is a body of light colored sandstone. Below that, and exposed in great bluffs just to the east of the Sespe district, is a thick bed of shaly limestone made up of the remains of microscopic sea organisms. The limestone is dark and when freshly broken gives out a strong bituminous odor.

Below the limestone are clay shales and then a thickness of several thousand feet of reddish or purplish sandstone. The wells have been bored in clay shales and sandstone, penetrating the latter in some cases more than 1500 feet. The oil is found chiefly in the more porous portions of the sandstone.

The greater portion of the large body of petroleum occurring here must have been derived from the shaly limestones. They once covered the sandstone but have now been removed by erosion from the area in which the wells have been bored.

There can be little doubt that the oil has passed downward from the limestone to the sandstone where it has found lodgment. This condition has been made possible by the fact, illustrated in some of the wells, that the sandstone contains but little water. One well put down in the sandstone to the west of the main producing area reached a depth of more than 1500 feet without encountering enough water for drilling purposes. While to the east where the most of the wells are there is more water now, this water must have been absent once for we cannot concieve of petroleum passing downward into rocks filled with water.

There can be no doubt then that petroleum does move from one horizon to another in response to the law of equilibrium. The direction which it takes is dependent upon the character and position of the rock strata.

Chemical action is an important factor in the formation of the oil from the organic remains and in its subsequent movements. In many of the fields it is undoubtedly still forming, for we find it coming to the surface in connection with hot or cold mineral springs. Many interesting problems are encountered in the California oil fields, and generalizations for other fields are not always true for this region.

Some Characteristic Mines of the California Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS.

The mines of the gold belt of California occur in a variety of formations, and under the varying conditions met along a distance of more than 200 miles these mines have certain characteristics peculiar to each type of vein. These distinctive features are influenced largely by the character of the inclosing rocks. In a recent issue was printed some characteristic features of veins in granite in California, which may be considered as one of a number of papers on this subject. Veins occurring in slate are very different from those in granite, and those in amphibolite schist differ in many respects from those in other rocks, and so throughout the State the formation has an important bearing on the geological structure, if not the value of the mines.

The largest and most extensively developed mine on the Mariposa Estate is the Josephine and Pine Tree mine. This property is situated on a mountain side overlooking the Merced river, a mile and a half north of the town of Bear Valley. The property was one of the first opened in the county. It has had several owners, but is now owned by the Mariposa Mining & Commercial Co. of San Francisco, Cal. The mine consists of two gold-bearing quartz veins which form a union near the summit of the mountain. The Pine Tree vein has a strike a few degrees west of north. On the surface the point of divergence is at what is known as the Fremont shaft. The Pine Tree vein is about 8 feet in width at this place and dips 62° to the eastward.

On the croppings at the point of junction the Josephine vein greatly resembles the Pine Tree, and is separated from the latter by a seam in the quartz. The former suddenly sweeps around to the westward in a curve, having a radius of about 100 feet. When it has reached a line striking north 30 west the vein seems to strike in a tangent in that direction and maintains it as far as observed for a long distance. The Josephine takes the same pitch as the Pine Tree, or approaches it closely, being about 55° to 58° to the northeast and eastward.

On the lower (foot wall) side of the Josephine vein are two large and several small veins of quartz, separated from each other by soft, much decomposed material having a slaty structure. These veins branch out from a common point in the Fremont shaft, sweeping around to the westward, but appear to converge slightly northward as seen in an exposure in a cut some distance from the point of divergence, and probably reunite to form one vein or mass of quartz and gold-bearing material. The two principal veins—Pine Tree and Josephine—have quite marked but widely differing characteristics.

The veins are best exposed on the level known as the English Trail drift, which was started under the direction of the English company that at one time owned the property.

Taking a cross section at a point 437 feet below the croppings at the Fremont shaft, it is found that the two veins converge on this level at a point about 100 feet north of the point of meeting on the croppings, showing that the line of convergence is not vertical, but inclined to the northward.

A crosscut at the point where these veins converge in the English Trail level shows a body of quartz 40 feet in width, dipping uniformly to the westward at an angle of 60°. Along the drift, which follows closely the Pine Tree vein, the two great veins are separated by a mere seam no thicker than a knife-blade. Northward a mass of soft material, composed of ankerite with mariposite and quartz, separates the veins by a few feet. Still farther northward the divergence is greater, and the Pine Tree vein shows a gouge 1 inch thick on the hanging wall side of the vein. A crosscut has been driven 25 feet eastward through a mass of crushed and highly altered ankerite to a second gouge, containing fragments of the rock mass. The gouge is from 1 to 2 inches thick and is extremely tough, but soft. The wall beyond is polished like a mirror and was formerly considered the hanging wall of the vein. I find the material beyond the slip to be identical with that in the crosscut, and conclude that it is not the true wall. Serpentine occurs on the hanging wall side of the vein at the surface, over 200 feet distant. The serpentine approaches the vein, going northward, however, and the tunnel driven near the Merced river, about 900 feet lower than the English Trail drift, lies on the hanging wall side of a zone of material similar to that found in the crosscut above referred to, the altered ankerite. The ankerite, containing mariposite, separates the Pine Tree and Josephine vein, and the material grows broader as the veins diverge, until where they are 80 to 100 feet apart and more does not fill the entire space between them.

The Josephine vein is distinguished everywhere along its course by what may be termed its fragmental appearance. A banded structure is frequently apparent, but mixtures of quartz and black slaty material are the most persistent feature.

The quartz of the Pine Tree vein is massive, often iron-stained in the upper portions and occasionally contains a small amount of the magnesian silicate—mariposite. It never includes black slaty material in any portion of the vein.

Taking as the initial point of observation that portion of the mine lying a short distance south of the intersection of the veins in the English Trail drift level, it is found that both veins thin out like a wedge and come to a seam of quartz. The workings here do not disclose whether or not the veins reappear immediately southward. On the surface, however, considerable outcrops are found at intervals going toward Bear Valley, showing that the crevice is continuous at least.

From the point where these great veins thin out they swell going northward and northwestward. At a distance of 115 feet they have made a wide mass of quartz, being still together, but separated by a mere seam or crack in the quartz. In a short crosscut a little way farther on a clay gouge 4 inches in width constitutes the dividing line. At 66 feet from the point of the wedge the two veins have parted abruptly, and in a crosscut, run here, are found to be separated by 30 feet of ankerite and mariposite, which is seamed with quartz. Similar material is found on the footwall or west side of the Josephine, near where the veins separate.

What might have proved an interesting exposure in a drift was inaccessible, owing to its having been filled with ore mined in some other portion of the works and stored there. I am told the Pine Tree vein is 40 feet wide here and is separated from the Josephine by ankerite containing mariposite.

Continuing northwestward to another crosscut, the two veins are found to be 60 feet apart. Another crosscut farther north crosses the Josephine ore body, which is 48 feet in width. The cut has extended but a foot beyond the ore body, but here discloses a talcose material heavily charged with cobaltiferous mispickel (danaite), and forming the hanging wall. In a crosscut 514 feet to the northwestward from that last described as cutting both veins, it is found that the Josephine ore body is 51 feet in thickness, having a black slate footwall and a hanging wall of the talcose rock above referred to. This rock has a thickness of 15 feet and is succeeded by 115 feet of ankerite and mariposite with many quartz seams. Thus the Josephine and Pine Tree veins are at this point 130 feet apart.

It is found by platting the workings and the several formations that when the Josephine vein has assumed a regular course the angle of divergence is about 8°, though on the surface it would seem to be 30° or more. The Josephine is characterized by a ragged, bunchy appearance of the masses of quartz and slaty material which sometimes assumes a banded appearance. Frequently solid vein-like masses or kidneys of quartz are developed, which are separated from each other by the quartzose, slaty rock or by black slate. All of this material contains gold, however, and may be considered as one shoot or ore body. From present knowledge the pay shoot seems to dip to the northward along the vein. About 1000 feet to the northward of the workings above described are other workings which show an ore shoot 70 feet or more in width similar in character to that on the English Trail drift level.

The material separating the Josephine and Pine Tree, mostly a mass of ankerite and mariposite, contains little or no gold.

The Pine Tree mine is everywhere characterized by its massiveness, its entire freedom from slaty inclusions. Iron pyrite occurs in the quartz, but is not abundant.

The vein is usually well defined by smooth walls, the foot wall being always, as far as observed, mariposite and ankerite. The hanging wall side of the quartz vein is a granulated mass of rock, containing many fragments of what appear to be the ankerite. The real hanging wall—normal country rock, *i. e.*, slate, diabase or serpentine—have not been cut on the English Trail level. At the mouth of the old Pine Tree tunnel, now caved and inaccessible, the serpentine is found close to the vein. Southward, up the hill, it is fully 200 feet away from the vein. In the River tunnel the serpentine forms the hanging wall of the vein—that is, it lies on the hanging wall side of the fragmental rock referred to as occurring on the hanging wall side of the quartz on the English Trail level. In the River tunnel the Pine Tree vein splits up and makes good-sized quartz veins in this fragmental material—the crushed ankerite—which to me appears to be a dyke which has become greatly altered by the movement and fracturing of the rock masses. In places the quartz is confined to the foot wall side of the dykes, ranging in width from 4 to over 40 feet.

The Josephine vein occurs along a zone of shattered slaty rock, into which quartz has infiltrated, forming the great kidney-shaped masses. A fault plane doubtless exists, and in some places it appears thereon, several of them extending across a zone fully 50 feet in width.

Northward the Pine Tree vein has not been distinctly traced beyond the Merced river, but several miles southeasterly from Coulterville great dolmitic masses—ankerite, in part, with much mariposite—are found, and extend for miles in a generally northerly direction, accompanied by large veins and kidneys of quartz, in many ways similar to the occurrence at the Pine Tree. The formations are usually either amphibolite schist, serpentine, diabase or black slate, differing from point to point.

The Josephine vein has a foot wall of black slate, which at some distance from the vein gives place to a typical grauwacke. Northward the vein splits up into several veins, and continues to near Pinon Blanco, where it reunites with the great dolmitic vein.

W. H. S.

Liquid Air and Its Possibilities.

There have been some extravagant claims made for liquid air. The discovery of the fact that liquid air can be actually produced is new—too new to make broad assertions as to the tremendous energy which may be developed by its use. Should it be demonstrated that liquid air in assuming a normal temperature develops an amount of energy greater than that required to make it, it will be contrary to all laws of physics heretofore accepted. Many men in many ages have experimented on devices which, once set in motion, continue to move on forever—perpetual motion. Mr. Tripler has made claims for liquid air which put perpetual motion in the shade. Prof. Henry Mortan, in a communication to the *Scientific American*, disputes some of the extravagant statements. He says:

"We are told that Mr. Tripler uses to make his liquid air a steam engine of 50 H. P., and that with this he can make liquid air at the rate of fifty gallons a day. This I know, from other sources, is substantially correct, and means that each H. P. in a day (say ten hours) makes one gallon of liquid air; in other words, one gallon for 10 H. P. hours.

"It is again stated that a cubic foot of liquid air contains 800 cubic feet of air at ordinary atmospheric temperature and pressure, or, in other words, any volume of liquid air, if adequately heated, will expand 800 times in reaching atmospheric temperature and pressure. This is also substantially correct.

"We may remark in passing that this is nothing wonderful; for water, when expanded into steam at atmospheric pressure, increases about 1700 times in volume, or more than twice as much as liquid air.

"Now, if we apply to the above data the well-known and universally accepted formula for the maximum work done by air when expanded at constant temperature, we find that a pound of liquid air in expanding 800 times would develop about 190,000 foot pounds of work. As a gallon of liquid air weighs about 8 pounds, this would give eight times as many foot pounds, or 1,520,000. If this work were accomplished in an hour it would represent almost exactly three-fourths of a H. P., because 1 H. P. means 1,980,000 foot pounds of work per hour, and 1,520,000 is only a little over three-fourths of this.

"From the above it follows as a matter of absolute certainty that the maximum power which liquid air could develop in an ideally perfect engine without any loss from friction or other cause would be three-fourths of a H. P. for an hour for each gallon of liquid air expended.

"We have seen, however, that with his 50 H. P. plant, which on account of its size should operate with considerable efficiency, Mr. Tripler makes only one gallon of liquid air with 10 H. P. hours. In other words, he requires to make a gallon of liquid air twelve times as much power as a gallon of liquid air could possibly develop in an ideally perfect engine.

"In face of this, how extremely absurd is the statement that with a little engine, lacking all conditions for efficient working, he can make ten gallons of liquid air by the use of three!"

More Light in Greater America.

The hitherto unequalled illuminations of the grand court of honor during the Transmississippi Exposition will be admirably outshone by the electrical novelties and effects now being prepared by skillful electricans for the Greater America Exposition at Omaha, which will open its gates July 1st and continue for four months. Over 15,000 new lights are being placed upon the great main buildings alone, whose grand proportions will be completely outlined in flaming curves and angles, and many startling effects never shown before in outdoor electric illuminations are being provided. Last year's illuminations excited the warmest admiration of all visitors, but a marvelous revelation awaits visitors to the first Great American Colonial Exposition.

Shipping Ore from Maine to Colorado.

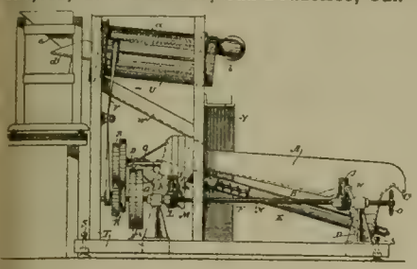
The Portland *Courier* says: "In a few days a carload of lead ore will be shipped to Denver, Colo., from Maine. This is the first time that ore has been taken from the Atlantic States half way across the continent. The ore comes from the Robinson mine, near Solon, Me., in Somerset county. The owner is a Pennsylvanian, who discovered, when he went into the woods near the vicinity to mark up lumber, a well-defined vein of galena ore, mixed with white quartz, 5 feet 5 inches wide. He sunk a shaft which is now 60 feet deep and found the ore to assay 93.21 ounces in silver."

Latest Mining and Metallurgical Patents.

Patents Issued May 9, 1899.

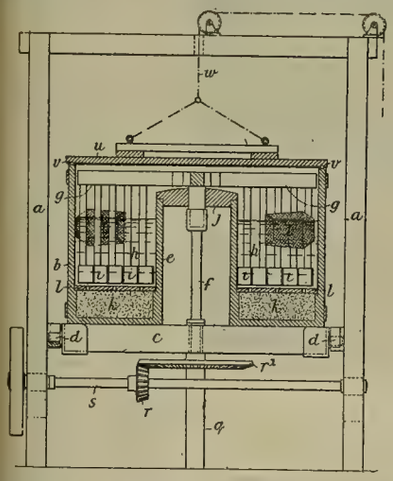
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

COMBINED GRAVITY SEPARATOR AND CONVEYOR.—No. 624,612; T. J. Barbour, San Francisco, Cal.



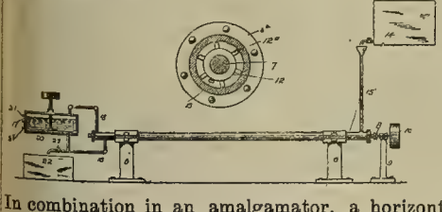
An apparatus for separating materials of different specific gravity comprising a receptacle having an ungated inclined bottom and vertical sides, a feed ening at upper end and a discharge at top of lower d, a chamber or well extending vertically below ttom proximate to the discharge and in which er end of inclined bottom terminates to receive avier material therefrom; means for supplying ter to receptacle whereby lighter material overws therewith at discharge, a screw conveyor and nclosing casing therefor exterior to receptacle, d conveyor having its receiving end entering mber or well at a point above its bottom whereby terial of intermediate specific gravity is conveyed of the chamber or well and discharged at the opite end of the conveyor; an overflow passage at upper side of tank adjacent to chamber, an ined cylindrical screen situated above upper end of k, a chute into which material passing through een falls and by which it is delivered into tank, a te into which larger material from the lower end ylindrical screen is conveyed away, a water-spray e extending longitudinally within upper part of ary cylinder and a feed apparatus by which maial is delivered into upper end of cylindrical screen l connecting mechanism whereby parts are kept motion.

APPARATUS FOR USE IN TREATING METALLIC ORES; No. 624,633; F. A. Edwardes, London, England.



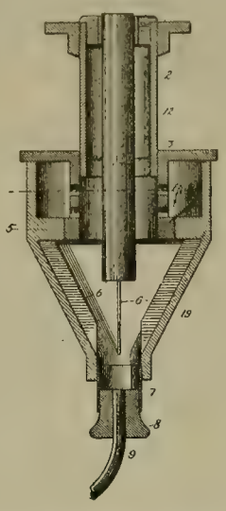
Apparatus for treatment of metallic ores, the comation with a vat for containing ores, of skimmers sisting of perforated receptacles, located in a rizontal plane above bottom of vat and means for ving receptacles in vat, in a plane parallel with face of liquid, receptacles being open on side ing direction in which they are moved through id and having a stirrer and a skimmer working vat, a cover for hermetically closing the vat and ans for tipping vat for discharging contents.

AMALGAMATOR.—No. 624,894; W. M. Fuller, Colodo Springs, Colo.



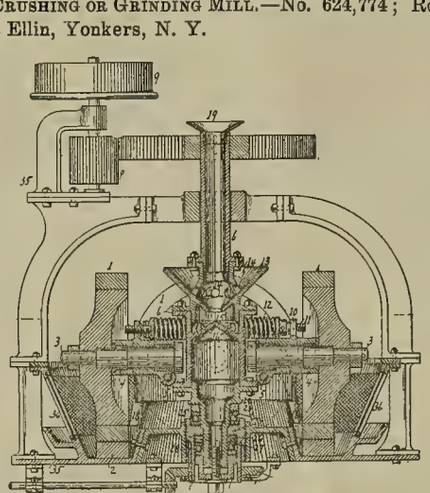
In combination in an amalgamator, a horizontal pe, a rotary shaft therein having agitating projecons extending therefrom with free spaces between permit pulp to exert a pressure freely longitudilly of pipe and between projections of shaft, an elested pulp tank elevated at a suitable distance ove horizontal shaft to produce a hydrostatic essure therein, a pipe connecting same with one end of amalgamating pipe and an elevated receptacle for displaced mercury having a pipe connection with same and end of horizontal pipe opposite to that with which feed pipe for pulp connects. Means for rotating shaft, an elevated pulp tank to place material in horizontal pipe under a positive hydrostatic pressure to force the material therethrough, a pipe connecting same with horizontal pipe at one end thereof, a receptacle for mercury elevated in relation to horizontal pipe, a connecting pipe extending from mercury receptacle to end of horizontal pipe opposite that with which pulp tank is connected, and a tailings pipe extending from opposite end of horizontal pipe to discharge into mercury receptacle.

HYDRAULIC SEPARATING APPARATUS AND METHOD OF SEPARATING.—No. 624,684; R. H. Richards, Boston, Mass.



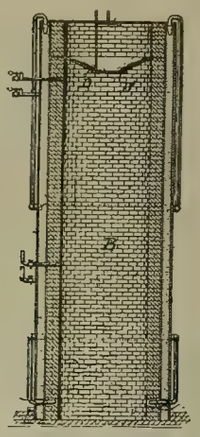
A method of separating or removing from a stream or current of water fine particles of matter contained therein, which consists in subjecting carrying stream or current to action of an ascending current of water having a whirling or spiral movement, whereby pressure is rendered and maintained uniform throughout its entire area, pressure or force of ascending column being regulated to prevent descent of any particles of less than predetermined weight. The herein described well or pocket for hydraulic separators consists of pipe 2; flanged annular body 3; shell 4 provided with ledge 5 and fins or wings 6; tangential inlet 10; oblique passages 11; core 12; blades 13; in combination with a trough, a supporting-collar 1; a tube 2 suspended from collar; a flanged shell 3 carried by tube; a casing 4 carried by shell and provided with ledge 5 and wings 6; a plug 8 closing lower end of casing; a discharge pipe 9; a tangentially arranged inlet pipe 10 communicating with interior of casing; non-radial inlet openings 11 through shell; and a spider 13 provided with vertical wings or blades; in a well or pocket for hydraulic separators, combination of an annular or cylindrical chamber provided with a tangential inlet for admission of water; a vertical pipe or extension through which water may rise, tapering base to receive particles falling through water; a non-radial passage for delivery of water from annular chamber to upward extension, a central core and blades or wings located above and below annular or cylindrical chamber, and serving to arrest whirling motion of the water which occurs between said points.

CRUSHING OR GRINDING MILL.—No. 624,774; Robert Ellin, Yonkers, N. Y.



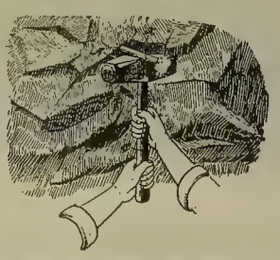
In a grinding mill, the combination with a pan and grinding wheels, of a centrally arranged hollow shaft provided with a feed hopper and having plurality of perforations formed at point beneath hopper, a conical distributer arranged in hollow shaft, base of conical distributer extending entirely to inner wall of hollow shaft at a point immediately below perforations therein, and a plurality of feed chutes leading from perforations and terminating between grinding wheels. The combination with a pan and grinding wheels, of a centrally arranged hollow shaft provided with a feed hopper surrounding shaft and provided with a discharge end disposed centrally within shaft. Combination with a pan, of an upright shaft, radial sleeves hinged to shaft, horizontal shafts journaled in sleeves and carrying at their outer ends grinding wheels arranged to travel in a circular path in pan, springs arranged above sleeves and bearing at one end against upright shaft and at their opposite ends against a support on upper side of sleeves, and means for adjusting tension of springs. Radial sleeves hinged to the shaft, each provided with a threaded eye, screws fitted in eyes, coiled springs interposed between the ends of screws and upright shaft, horizontal shafts journaled in sleeves, and grinding wheels mounted on outer ends of shafts and arranged to travel in a circular path in pan, screws operating to adjust tension of springs and press wheels into the pan with an adjustable pressure.

PROCESS OF ROASTING ORES.—No. 624,833; E. E. Lungwitz, Pueblo, Colo.



In the roasting of sulphide ores, the method of stirring ores which consists in effecting roasting under atmospheric pressure and suddenly removing external pressure on ore while blast is temporarily shut off, whereby compressed gasses within ore mass break it open.

MINING HAMMER.—No. 624,883; F. R. Waters, Ouray, Colo.



A miner's hammer having its head provided with a transverse groove extending across the outer side, same being central or equidistant from its ends, which are similar in form and size, as shown and described. A hammer-head for miners' use, having a transverse groove sunk in body of head, whereby latter is adapted for use upon a drill, as and for purpose specified.

The Future of Zinc.

David D. Day, chief of the division of mineral statistics of the United States, gives it as his opinion that $55 a ton for zinc ore is an extreme price, but is satisfied that prices will not return to what they were before the rise began. The conditions indicate a permanent degree of prosperity for the zinc industry never before known. He thinks $55 a ton a high price, but believes the future price will be between $30 and $40 a ton. Metallic zinc is quoted at 6¼ to 6½ cents a pound, or twice the price of three years ago, yet no surplus is accumulating. A recent order for 2500 tons of zinc could not be filled.

In '96 the United States metallic zinc product was 78,000 tons; in '97 it was 100,000 tons; in '98 it was 125,000 tons.

The Missouri-Kansas district in this time increased from 360,000,000 pounds in '96 to 470,000,000 pounds in '98. In '99 it should exceed 500,000,000 pounds. The zinc mines abroad are giving out, and from being an importer, the United States has become an exporter of zinc.

Water as a Road Maker.

Written for the MINING AND SCIENTIFIC PRESS by WM. M. BRISTOL.

There is a trite maxim that fire and water are good servants but bad masters. Certain it is that, in its relation to roads, storm water usually occupies the latter position; in fact, in hilly or mountainous districts it is a destructive tyrant.

The use of water in the preservation of roads during the dry season in California is becoming general, it having been repeatedly demonstrated that sprinkling not only keeps down the dust, but prevents the formation of "chuck holes" and the disintegration of the roadbed. The employment of water in road construction, however, is not so common, chiefly because the conditions favorable to its use in this manner are not often found in conjunction.

The accompanying illustration presents a view of a section of the new road connecting Redlands and Highlands, in San Bernardino Co., Cal. The bluff shown is the south bank of the Santa Ana wash and is about 35 feet in height. It is also the northern terminus of the plain on which stands the fruit-growing district of Lugonia. The plain slopes toward this terminus on a grade of about one per cent. When the opening of the road was decided upon two years ago the method of connecting that portion of it on the plain with the part traversing the wash was one of the first questions to be settled. Either an elevator or a cable was suggested in burlesque, but the simple and natural way was to make a long and deep cut and an equally long and high fill. It was an easy matter to borrow a stream of water from an irrigation ditch, lead it in a furrow along the center line of the proposed cut and let it tumble down the face of the bluff, carrying with it the sandy loam from the ever deepening and widening furrow. Here was an ocular demonstration of the power of running and falling water, and it fascinated the grown-up boys who had fettered the hydraulic Samson. A wagon-way from the plain down to the wash was sluiced out in a day, but a major portion of the debris which was deposited in fan shape at the foot of the bluff was lost so far as the needed fill was concerned.

A ROAD BUILT BY WATER POWER IN SAN BERNARDINO CO., CAL.

The road was left for a year in this unfinished condition, and the teamsters who toiled up the steep grade through the cut said hard things about the soft sand. Although of sufficient depth the cut was barely wide enough for a single vehicle, but last winter it was proposed that the water be made to finish the widening and at the same time deposit the debris where it was wanted. With this in view the prunings from adjacent orchards were siloed on either side of the road, beginning at the foot of the bluff and extending some distance into the wash, the inner sides of these wingdams being lined with fine brush and leaves. The object of this was to confine and direct the flow of the debris-laden water, and it served the purpose fairly well. But the supply of brush was insufficient and some other method had to be devised; consequently two teams were employed in plowing the fill, repeatedly turning the earth from the center toward the sides and leaving an enormous dead furrow down which the water was turned.

During the first part of the work the water was shut off as soon as this dead furrow was filled with earth, and the deposit was of such a sandy nature that plowing could immediately be resumed. Later the plowmen, who wore rubber boots, found that they could plow while the water was running, and for days irrigation and tillage wrestled with each other in seemingly vain confusion; but the fill grew until the brush flanks were left several feet below.

For the purpose of widening the cut a stream of water was led along the top of each bank some distance back from the edge, the streams being turned inward at such a point as to debouch within the brush wings. Thus it may be seen there were for a time three cuts which finally became merged into one. The work of the plowmen was not confined to the fill, but extended through the cut as well. In the latter, however, the earth was turned toward the center where, in its loosened condition, it was easily moved by the water, running on a grade ranging from four to six per cent.

The approach of the irrigating season, coupled with the scarcity of water last spring, necessitated the suspension of the work before it was quite finished. Since the view was taken, however, the sluicing has been finished and the sub-grade is soon to be covered with an 8-inch layer of red, mesa soil. After this surfacing is completed and before it is hardened by travel, the roadway is to be thoroughly sprinkled with crude petroleum. This will make the surface waterproof and will prevent storm water from making ruts in it, and, as has been amply proven elsewhere, will also be a preventive of dust.

There are times and places in southern California where water may be profitably employed in the construction of roads, and others where the use of oil will doubtless be found the most economical method of preserving them.

Some Notes on the Geology of Leadville, Colorado.

Written for the MINING AND SCIENTIFIC PRESS.

After having been flooded several years, the mines in the lower portion of the Leadville district are being unwatered and the great carbonate camp is taking on new life. Since these mines were shut down some important changes have taken place in the economy of mining in that region, and that, together with an advance in the price of silver, has resulted in the reopening of these long-abandoned mines. No doubt the active interest being taken in all mining enterprises is also in a measure responsible for the renewed activity in the mines of Leadville. The city is situated on the slopes of the hills lying on the east side of the Arkansas river, at an altitude of over 10,000 feet above the sea.

This revival of the mining industry gives the geology of the ore deposits of that region renewed interest.

The large amphitheater-shaped basin in which the mines of Leadville occur shows clearly the glacial origin of that portion of the valley. But the evidence is doubly conclusive in the glacial lakebeds and drift which underlie the city of Leadville and a considerable area outside of the city limits.

The Leadville district has been and is still a large silver producer from lead and iron ores. The geology of the district is not by any means complex, though faults are numerous and extensive.

The base of the sedimentary series is represented by a heavy bed of dense, firm quartzite which is referred to the Cambrian, and this is generally conceded as being correct. In places it attains a thickness of over 100 feet. Some gold and a little silver has been mined from it. The quartzite rests unconformably on the upturned schists of Archæan time, though the latter is in places displaced by porphyritic eruptives.

Overlying and conformable to the quartzite is a stratum of white magnesian limestone, and upon this rests a second stratum of quartzite (locally known as the parting quartzite). These latter are probably of Silurian age, but some refer them to the Cambrian.

Next in the ascending order is a thick, heavy bedded deposit of blue limestone (Silurian), which is one of the principal ore-bearing formations of that region.

The blue limestone is usually covered by a heavy sheet of felsite porphyry of a white or light gray color, which in places is interstratified with sheets of gray porphyry, which bear the appearance of having been injected into the mass from the neighboring eruptive dykes.

Over the greater portion of the area, immediately in and about Leadville, the felsite porphyry completes the series of rock formation. The remaining localities are covered with a deposit of Weber grits (a coarse-grained sandrock), which in places is deserving the name of conglomerate. The thickness of this deposit is variable.

Over the entire region is spread a deep quaternary deposit of glacial lake beds and post-glacial drift. So general is this formation that an outcrop of rock is rarely found at the surface.

This fact alone has rendered prospecting in Leadville difficult, expensive and uncertain; but, fortunately, owing to the unusual extent of the ore deposits, but few shafts have been sunk to contact that have failed to find the ore in greater or less quantity. The great ore bodies which made Leadville famous during the early period of her history, lie mostly in the upper portion of the blue limestone, and usually in contact with the overlying felsite; there are, however, exceptions.

Mining experts have advanced numerous theories to account for the ore deposits, and there is still a disagreement as to the class of veins to which these ore bodies should be referred. Many have called them contact veins. Others call them contact fissures. The finding of slickensides in some of the mines, notably the Colonel Sellers, probably led to the adoption of the latter name. It should be borne in mind that the crust of the earth is being subjected constantly to forces which produce motion, and slickensides is the result—not only in mines, but elsewhere, far removed from mineral veins.

Slickensides very frequently occur in mines subsequent to the formation of the veins or ore deposits. When this is the case there is usually some physical evidence by which it may be determined.

The origin of the Leadville ore deposits is a question which has been much discussed, and many theories have been advanced to satisfactorily account for them. While these several theories differ somewhat, all geologists agree that there is an intimate relation between the ore bodies and the eruptive rock of the region.

The opinion of S. F. Emmons, as given in the United States Geological Survey reports during the early history of Leadville, was to the effect that the ore deposits were derived directly from the overlying felsite; that the mineral solutions percolating along the bedding planes of the upper portion of the blue limestone, precipitated or deposited their mineral contents, slowly, atom by atom, replacing the limestone, which, being dissolved by the mineral acid in the water, was carried away by the percolating waters. Mr. Emmons was also of the opinion that when the mineral solutions came in contact with a dyke of porphyry, the dyke acted as a dam, and for a time checked the flow of the mineral waters, and that portion of the ore body was in consequence much enriched. Finally, however, the waters passing through the dyke were arrested, as in an eddy, on the other side, and it, too, became

the resting place of large quantities of silver-bearing ores.

Charles M. Rolker, having the advantage of a more thorough and extensive development of the mines of the district, was also of the opinion that the ore bodies derived their contents from mineral solutions circulating along the bedding planes of the lime rock, and also of the contact with the porphyry, and that the mineral solutions came from the eruptive rock of the vicinity, but not from the white porphyry. His opinion is that they came from the gray porphyry dykes, and, to give greater force to his argument, points to the fact that over considerable areas a dolmitic sand intervenes between the ore body and the felsite. He furthermore offers as evidence that these mineral solutions came from the gray dyke porphyry, that the ore chutes follow the dykes and are richer near to them than at a distance. This is more particularly the case on Fryer Hill, where are located some of the most famous mines of the district.

There are other bodies of lead-silver ore where no overlying sheet of porphyry exists, and where the ore bodies have an undoubted relation to porphyry dykes in the vicinity. This is the case at Galena, in the Black Hills of South Dakota, where the ore bodies occur in a heavy stratum of Cambrian quartzite; also at the Carbonate Camp, West Virginia, South Dakota, where the ore bodies occur in limestone accompanying porphyry dykes and there are other instances similar to those at Leadville.

It is more probable that the solutions which deposited the ores in the limestones and quartzites of the Leadville district came from great depth and used the fissures formed by the porphyry dykes as convenient channels along which the ascending currents passed, depositing the ore in the most favored localities—that is, where the previous preparation of the limestone or quartzite by crushing, due to dynamic causes, made the dissolution of the atoms of lime, etc., more easy.

The normal condition of the ores of Leadville was beyond question sulphide, as proven by the frequent occurrence of sulphide ores in partially decomposed masses of ore, and more particularly from the fact that the ore being taken from below the water line of the district is, without exception, sulphide. The minerals are the sulphides of lead, iron, copper, zinc and sulphide of silver, with some native silver and a little gold.

The ores of the large and rich bodies found near the surface or in the higher levels of the mines are carbonate and sulphate of lead, with minimum and some rarer lead ores, oxides of iron, carbonates and oxides of copper, with some oxide of zinc, together with chloride of silver (in some instances in large and handsome masses), all of which have been produced by a decomposition of the sulphide minerals. Native silver and gold also occur.

The large masses of chert found in some of the mines are probably due to the more silicious condition of the limestone prior to the deposition of the ore.

During the earlier period of the history of Leadville it was thought that the ore bodies were confined exclusively to the upper portion of the blue limestone, but the development of later years has disproved this theory, as many large and rich deposits have been found in the lower portions of the limestone, which in places has a thickness of 300 feet. The first development in sulphide ore bodies took place in the Colonel Sellers mine, in California gulch, and subsequently similar deposits have been discovered on Carbonate hill and elsewhere. A like development of ore bodies obtains at the Carbonate camp, South Dakota. These ore bodies occur in segregated bunches and sheets, sometimes apparently following the bedding planes of the limestone and at other times being entirely independent of it. They frequently have no apparent connection with each other, but a very close examination usually discovers a narrow seam of ochre or mineral (sometimes a mere seam of clay), which actually forms a connection between two or more bodies.

Leadville is by no means an anomaly, having many duplicates in all essential characteristics. In addition to the mines of South Dakota above mentioned may be added the mines at Aspen, Colorado; those of Eureka Hill, Nevada; Little Cottonwood and the Bingham and Dry Canyon mines of Utah; the mines of Sierra Majada, Mexico; and some in North Park, Colorado, Wyoming, and in Idaho. The mines of all sections mentioned bear a similarity to those of Leadville. From a consideration of the conditions found in these various mining regions it would seem that the intimate association of limestone and porphyry or any sedimentary rock, and an eruptive rock, may possibly result in a mine. Hundreds of places may be pointed out where the contact exists, but where no ore body has been found, but there are few lead-silver mines in existence where these conditions do not obtain.

It is a matter of fact that nearly all large productive mines have some very evident relation to volcanic rocks in the vicinity, at least volcanic rock is there—in the neighborhood of the vein.

There are several different porphyries at Leadville, the most important of which are the white or felsite porphyry and the gray or dyke porphyry, which deserve more particular mention because of their intimate association with the ore bodies.

The felsite at one time extended over the entire region in an immense sheet, which in some places attained a thickness of several hundred feet, though much of it has since been eroded by the scouring of glaciers, until, in a few instances, it has been removed entirely.

This porphyry is a portion of the immense eruptive mass which found vent at the head of Big Evans gulch, some ten miles from Leadville. It doubtless occurred in the form of a great lacolite, and the sheet which covers the area of the Leadville region is probably only one of a number of such sheets which were injected between the layers of sedimentary strata.

The gray porphyry, however, seems to have been the result of local forces and is confined to a limited area (the mineral region), and has a more intimate relation to the ore bodies than to the felsite.

There is reason to believe that the ore bodies of Leadville were formed at a depth of 10,000 feet. The fact that this amount of sedimentary strata has been removed by the various processes of erosion would suggest this. The ore bodies, where found cropping at the surface, expose a considerable face, showing that they undoubtedly extended outwardly beyond their present limits. All the faults of the region have occurred since the deposition of the ore. There is ample proof of this in the fact that where ore bodies have been faulted their continuations have always been found to be counterparts, as regards size; moreover, fragments of the ore bodies have, in many instances, been dragged into the fault planes, and this alone is considered conclusive.

Most of the mines which have been recently unwatered are producers of sulphide ores of comparatively low grade, but containing sufficient values at the present price of lead and silver to insure a profit.

The gold mines which in recent years have attracted attention to Leadville are located in the eruptive rocks, forming the hills east of the city. They belong to that type of ore deposit common to massive eruptive rocks elsewhere, the gold occurring in zones of fracture and crushing. Auriferous pyrite forms an important factor in these ores. Among the first of these mines to attract attention were the Antioch and Printer Boy, and later the Little Johnnie. Whether the quartzites which lie in the lower portion of the Cambrian formation in Leadville district contain valuable deposits of gold telluride ores similar to those found in the Black Hills of South Dakota under similar geological conditions has not as yet been determined, but as the known ore deposits of each district are otherwise so similar, it is not unreasonable to expect to find the telluride ores in the Leadville quartzites. S.

Some Experiences of a Working Miner.

NUMBER XVI.

Written for the MINING AND SCIENTIFIC PRESS.

Miners and prospectors are often sorely puzzled over the meaning and application of scientific and legal terms used in the various branches of the mining industry. In mineralogy particularly, there are some stumbling blocks in the way of the prospector who can pass an intelligent judgment on a prospect or kit of tools, but who knows little of such terms as ceragyrite and tetrahedrite, though he may readily recognize horn silver or chloride, as he is more apt to term it, and gray copper may be an every day thing with him.

I have known several prospectors who had gotten hold of a mineralogy, or at any rate some mineralogical terms, and they used them to the best advantage and in a most wonderful way. One day a party of prospectors were passing along a hot canyon in Lower California not far from Juarez, when one of them glancing at a ledge of rock incrused with thin coatings of green copper carbonate, remarked: "That's a pretty good looking prospect." "What is it?" one of the party inquired.

"Its malachite," replied the first,—"copper carbonate."

In the party was one of the kind of mineralogists above referred to and here was a good opportunity for him to display his superior knowledge of mineralogy. He climbed up to the ledge and knocked off a piece, examined it carefully and, tossing it disdainfully aside said, "that ain't malachite."

"What is it then," inquired the first, who had called it malachite.

"Why its nothing but verdigris o' arsenic," was the answer.

Many miners, mill and smelter men know to their sorrow of the danger arising from working in dry lead mines, dry-crushing mills where lead ores are treated, and around some furnaces where lead is a prominent constituent of the ore being smelted. When a man gets "leaded" from inhaling the dry dust of lead ores, or the fumes rising from large quantities of heated metal or ore, he is usually a very sick man and he soon is but a shadow of his former self.

We were discussing the phenomena attending "leading" one day when W—— spoke up.

"Yes, you bet!" he remarked. "I know what it is to be "leaded." Its pretty tough. I worked on the dump at the S—— B—— smelter last year and I gained eleven pounds in two weeks."

Everyone present laughed heartily, but W—— felt injured to think that his distressing experience should cause any merriment.

A few days later a prospector brought a strange looking piece of ore into camp and various opinions were passed as to what kind of ore it was. Finally one of the party, who was present at the discussion of the effect of "leading," suggested: "Show it to W——, he can tell, he has eleven pounds of lead in his stomach."

Mr. O—— was a schemer. His capital was largely made up of fertility of resource, and the undertaking he would not attempt could scarcely be conceived. I first met him in C——. Within fifteen minutes of the time of our first meeting O—— had told me that he was a schemer, and he had a scheme on foot right then. Said he: "I have a concession in H—— covering several miles of the richest placer ground in the world." Here he produced several bottles filled with dust and nuggets of gold. "These," continued he, "came from my mines. I am now outfitting to go there with a party of men. All I lack is a couple more miners."

I was rather taken with the magnitude of the scheme and finally made a deal with him, and myself and a friend joined the party, and a few days later we were on our way to the richest mines in the world.

The money to pay the expenses of this expedition was raised in C—— by the sale of stock in the organization, and we were told of the tons of provisions that had been provided; the easy time all would have; the fine houses on the concession, and the fortune that could be made incidentally from the magnificent forest of mahogany, rubber and other valuable trees on the concession in H——. A sawmill constituted a portion of the outfit, and we had also several hundred feet of iron pipe in sections, to be riveted at the mines. The party finally reached H——, and then the difficulties began. Among other things, there was a very apparent lack of management. Another and quite as important shortcoming was observable in the amount of money available for necessaries. When civilization was finally left behind (for these mines were a long way from anywhere), the several members of the party began to inquire what had become of those tons of provisions. To make a long story short, O—— had not provided enough grub to take the party to the mines, to say nothing at all of affording a means of living when we were at our destination. However, we were good foragers and managed to live on the natural resources of the country through which we passed, and we were thankful indeed that they were abundant—of the kind. At length, after much privation and hardship, the mines were reached; but, although the party got there without the loss of a man, there were no provisions, no tools, and no money with which to purchase the necessaries of life, and such things were not to be had if we had had million. The sawmill was scattered piece by piece along several hundred miles of our path, and the iron pipe had been similarly distributed along more than 1000 miles of the route to the mines. Not a single board was obtainable for any purpose, and there was no means at hand to make one. There was an abundance of fine pine timber, but there was neither a mahogany nor a rubber tree within more than 100 miles of the mines; and for houses, the only one was a cabin 10x12 feet, built of poles and furnished with a flat roof covered with earth. When it rained it was comfortable outside. The gravel deposits we found all right, and they were gold-bearing, too, but we had no means of testing their value further than by panning, and the outlook was so discouraging that myself and another of the party concluded we had had enough experience of this kind, and we walked over 300 miles to the nearest seaport and returned to C——.

This experience, which had been boomed considerably, cost the dupes of O——, who had induced them to subscribe to shares in this particular scheme, over $20,000. I don't know who got all that money. I know we did not. It seems almost incredible that a thing of this kind could be done, and so foolishly done at that; but these are facts.

I heard of another enterprising individual some time since who hired a number of miners and millmen—and in fact a full crew—and took them out to the H—— mine on the desert in the southwest. The mine was developed and had a good mill, but had been idle for some years owing to trouble among the owners. The property was located nearly 100 miles from the railroad or other communication of any kind. This man went out there with his party, opened the mine, stoped ore and ran the mill without the knowledge or consent of any one connected with the property. At the end of a month he took the cleanup, amounting to several thousand dollars, and left for the railroad, the men feeling secure in their position, as the mine and mill were still running full blast, with one of their own number in charge. They concluded to get their pay from the next cleanup if their employer did not return. He didn't return, but the owners had gotten word of what was going on and came in his stead.

Mining Summary.

ALASKA.

It is reported that claims on Minook creek are rich.

The latest advices from Cape Nome country tend to confirm the reports of strikes in the streams tributary to Snake river.

Sitka *Alaskan*: J. Winnie, from Dawson, reports at Skaguay that claims on the American side are turning out rich.

Juneau *Record*: A party of seven, headed by A. W. Boyle, has left Juneau for Indian creek, near Sunrise City, to develop property belonging to the Old Glory M. Co., in which H. Blackwell of Seattle and parties of Brooklyn are interested. They will build a dam across Indian creek to create artificial floods for sluicing. The property was prospected last year.

ARIZONA.

The Old Dominion copper mine is said to be earning from $50,000 to $60,000 per month.

G. N. Hooper, representing Boston capital, has purchased the Buster group of mines from Forbes & McKenzie, the price being $33,500. The group is in the Bradshaw mountains, two and one-half miles from the Crowned King. The Buster has 550 feet of development, showing a vein of free-milling gold ore ranging from 3 to 8 feet in width. A 10-stamp mill will be placed on the properties.

F. Dalby has discovered a copper lead near the mouth of the Grand Canyon of the Colorado river that shows free gold.

Prescott *Courier*: The Grand Canyon Copper mine is sending ore fifty miles to the railroad, where it is shipped to smelters. This property was bonded from G. Ridenour, and payments have been promptly made. Seventeen men are on the payroll. The paystreak is 24 inches wide.

Globe *Times*: Reports say that on the 200 level in the Ray mine the crosscut driven in the quartz porphyry is over 75 feet in concentrating ore.——At the Tribunal claim sulphide ores were found sinking.——M. Innes has his shaft down 150 feet and has high-grade concentrating ore, occasionally bunches of glance running as high as 70% copper. He will sink to the 200 level and crosscut to both walls.

Solomonville *Bulletin*: Stanley Butte mining district, which covers the coal fields mineral strip, cut from the San Carlos reservation, contains many promising prospects. Copper seems to be the predominating mineral in all the claims which have been opened, though silver and gold are also found. A shipment of sixteen tons from one of the claims netted the owners $2283.20. This shipment contained 1956 ounces of silver. The ore carried 33% copper. This was the first shipment of ore made from the Stanley Butte district, which covers a strip formerly part of the Indian reservation, and the Government would permit no work there prior to its segregation, which was consummated last fall.

Arizona *Republican*: The Richenbar mine, sixty-five miles from Prescott and eighteen from Mayer, is reported sold to J. H. Darragh of Trenton, N. J., who will erect a 20-stamp mill on the property. It is reported that there is $200,000 worth of gold ore in sight. Besides this 20-stamp mill Mr. Darragh is credited with saying that he will erect a smelter of 200 tons at Mayer, the eastern terminus of the Prescott & Eastern Railway, to treat ores from the Big Bug district.

Boston *News Bureau*: It is said that W. A. Clark has been offered $55,000,000 cash for his United Verde by French interests. The ore is said to run 18% copper as well as gold and silver values. Some reports have placed the price of his copper as low as 1⅛ cents per pound, by reason of the precious metal values in the ore. The shaft is down 550 feet, but he has bored 500 feet lower and 1500 feet ahead along his ore body without finding any change in the character of the rock. It is reported he is mining from a face 500 feet wide.

Tucson *Star*: The Weldon group of copper mines, in Pima county, is in the Quijotoa district, thirty-five miles southwest from Casa Grande, on the Southern Pacific Railroad, and eighty-five miles westerly from Tucson. Several claims show large croppings of oxidized copper and iron ores. These croppings are 1200 feet wide and 4000 feet long and rise 1500 feet above the neighboring hills. Several of these mines have ledges of good-grade, silicious gold-silver ores, which will work nearly ton for ton through water-jacket furnaces with the ferruginous copper ores, and make a product of black copper bars, carrying approximately 100 ounces silver and $100 gold per ton of bullion. The facilities for operation are good; the ores may be handled by gravity, and wood and water are plentiful. The mines are owned by McKay & Burgess.

CALIFORNIA.

Alameda.

The discovery of a vein of copper ore, bearing silver, is reported on the property of Dr. F. Saudelin, North San Leandro. A drift was run on the vein 15 feet, where it was found that the vein widened to 36 inches. The rock is decomposed white quartz, carrying silver and a trace of gold and copper.

Amador.

Sutter Creek *Record*: Twenty stamps are running at the Baliol mine at Sutter Creek and crosscutting is in progress on the 300 level.——At the Potazuba mine, Sutter Creek, a crosscut has been started at the 350 level to cut the vein, found in the drift on the 200 level.

Jackson *Ledger*: The Bellwether mine at Jackson has been reorganized by Mrs. Hepburn. The new organization is by San Francisco capitalists, who have agreed to pay 10 cents per share as the initial payment and an amount not to exceed 5 cents per share per month thereafter. Mrs. Hepburn retains an interest in the property.

Jackson *Dispatch*: R. Read has charge of the Centennial mine near Drytown and expects to start operations.——The Newton Copper Co. has taken charge of the copper mines belonging to H. Ranlett between Jackson and Ione, and has ten men at work unwatering the old shaft. Machinery for an 80-ton smelter is at the mine. This will be the first smelter operated in this county. Mr. Ranlett is president and manager of the company.——At the Pocahontas mine, Drytown, the 10-stamp mill is steadily at work. Preparations are being made to sink the shaft 200 feet deeper.——A San Francisco company has taken the North Gover and Loyal mines near Amador City, and will begin development of these properties. The company is headed by the Goodall-Perkins Co.——The Spagnoli mine at Clinton has started up. The perpendicular 4x8 shaft is down 40 feet. Two shifts are at work. Supt. D. Fisher expects to have the 10-stamp mill working as soon as the shaft is down.

Butte.

Oroville *Mercury*: The Bader mine on Magalia ridge works steadily and pays. It is owned and operated by Bader & Mowry, G. B. Mowry Supt. The mine drains itself. Surveyor McCoy is making surveys and a short bedrock tunnel is to be driven to tap the channel ahead of the present works.——At the Mineral Slide, near Paradise, a double track tunnel, 7x9 feet clear, is being driven to tap the gravel bed. It is owned by the Magalia Con. M. Co. of London, C. B. Frost Supt.——At the Golden Drift, near the Mineral Slide, prospect work is being done.——Three and one-half miles east of Paradise A. N. Butts of San Francisco has been working the Durgen or Miocene mine. He has the lands of Durgen and D. Westwood bonded and will prospect them.——At Kanaka Bar, on the west branch of Feather river east of Paradise, a flume has been built through which the stream will be diverted and the river bed worked by the Sterritt Co.——The American Lithographic Stone, Mine & Milling Co. are prospecting for the Big Channel and running a bedrock tunnel on Little West Branch, now in 1600 feet on the east rim.——At the Emancipation mine on Butte creek four men are driving a bedrock tunnel.——R. Diller has a force of men employed at the John Dix mine, taking out gravel.——The Old Tom Neal diggings are being worked by hydraulic under permit from the Debris Commission by West & Cummings. These diggings are on a tributary of Little Butte creek. They began washing May 1st and are getting coarse gold. At the Iron Rock channel in the bed of Big Butte creek a short distance below Inskip ravine gravel is being sluiced.——At Cherokee work is being done on "the flat." Supt. Helman says seventy-six men are working there on percentage.

Calaveras.

At the mine owned by J. M. A. Hauselt, west of Murphys, work is going on and it is expected the bottom of the channel will be reached soon. The machinery is ample to cope with the water and do all hoisting.

Central Hill placer mine has closed down. The main channel, which has been followed successfully for years, has been nearly worked out. The company still has a large area of unworked ground, which will be prospected. Some fine quartz gold was taken out during the recent work.

Mokelumne Hill *Chronicle*: A cleanup made at the Prussian Hill mine after a run of eleven days with a 5-stamp mill yielded nearly $1200. The mine is owned by C. and B. C. O'Neill of Jackson, Amador county.——Improvements are being added to the plant at the Paragon mine on the Licking Fork between West Point and Railroad, including a two-drill compressor, which will be running June 1st. The compressor plant is being installed at the mill. Air will be conveyed through a 2-inch pipe to the face of tunnel No. 1 which will be extended to cut the lead 200 feet vertical under tunnel No. 8. An east crosscut will be run 150 feet from No. 1 to No. 9. Lead in No. 8 is 20 feet wide and ore from this point supplies the 10-stamp mill. Grading for a concentrator room is in progress. The intention of Mgr. Shuman is to increase the milling plant to twenty stamps. Thirty-five men are employed. —— At the Cockley placer claim in Buckeye Gulch, three miles from Mokelumne Hill, a cleanup was made this week, the result of which was up in the hundreds. The gold is coarse and a number of ounce pieces were found.——At the Baire gravel mine, one mile east of Railroad Flat, the tunnel is in 700 feet and is 4x6 clear. At 350 feet from mouth drifts have been run across the channel which is 60 feet from rim to rim with an average depth of 5 feet. The development gives 2000 feet of unworked gravel. Taking out gravel from the back drifts towards the mouth of the tunnel has been commenced. Water is obtained from Clark's ditch and there is a good dump for the tailings. A cleanup is made every month. ——The Yellow Aster M. Co. near West Point will crush 100 tons of ore in the mill on the Champion mine. This is the mine which Cueto, Zavalla and Quantaro sold to Morgan, Jackson and Doane of San Francisco last winter.——W. E. Holbrook, J. A. Sterling, Jas. Kline and J. F. Sterling are at work on the Wide West mine near West Point. They have erected a 12-foot water wheel run by 2 inches of water taken from the Lone Star ditch. This wheel runs a 3-inch pump and keeps the mine free from water. They have twelve tons of shipping ore and twice as much free-milling ore. —— J. Bardsley of Sandy Gulch will commence milling ore at the Carlton mill next week.

Colusa.

Colusa *Sun*: J. P. Rathburn has leased his land to capitalists, who are to commence June 1st to bore for oil. There is a large area known to contain oil.

El Dorado.

A. Weske of San Francisco is preparing to work the Weske & LeBoeuf mine, near Georgetown. A ditch from Otter creek to North canyon is under way; an electric plant will be erected and mining operations commenced just as soon as theemachinery can be placed in position.

Dench & Craddock are keeping the 2-stamp mill at work on ore from their mine near Placerville.

A small town has sprung up around the Zentgraf mine, which is employing 100 men.

The cyanide plant at the Taylor mine is to be started up under the direction of H. S. Chapman. The sulphurets on hand, it is thought, will keep the plant busy for six months.

Placerville *Democrat*: Work at the Darling mine on Bear creek, near Georgetown, has recommenced. An English company has taken the property and work of unwatering the lower levels was commenced the past week. J. Word is putting the 20-stamp mill in shape. ——A. H. Jinkerson of Indian Diggings reports that place as being active since work commenced on the Indian Diggings gravel mine, owned by Hayward, Lane and the Hobart estate. Twenty men are employed and more will be put to work as soon as room can be made for them.

Kern.

The Red Dog mill at Johannesburg is running steadily. A 30-ton cyanide plant is operated in connection with the mill.

The Kramer rich find reported several weeks ago is now reported to be an ordinary prospect. A single shaft 40 feet deep has cut several small veins of gold rock. Some of the rock is said to be rich.

Bakersfield *Echo*: At the Comet mine on Greenhorn mountain pay shoots have been struck in two shafts and a tunnel, and the rock is paying $35 a ton. Arrangements have been made to put in a Cornish pumping plant and a 2-stamp mill. This mine is a mile and a half from the Waugaman mine.

Mariposa.

The results of the mill runs on ore bodies from new developments in the Mary Harrison mine, two miles south of Coulterville, are reported to have been satisfactory.

Nevada.

Grass Valley *Union*: Maroney, Schoonmaker, Webb & Baldwin have returned from French Corral, where they bonded the Red Ledge mine from D. Roberts for the California & Colorado Development Co., who will erect a plant on the property. Twenty years ago the Red Ledge was worked, but the gold was so fine, under the crude methods then in vogue it was not profitable.——The Geneva M. Co. will erect a 10-stamp mill on the Slide mine, which is located near French Corral.

Nevada City *Transcript*: Some rich specimens were taken from the Sleeping Beauty mine, near Moore's Flat, on Saturday, the pieces being filled with gold and sulphurets. Vizzard & Bauder are the owners.——Paul Ehmann of Spenceville has bought the copper mine belonging to the Jacksons, and has put men to work extending the main tunnel, which is in 200 feet. He will drive it 500 feet farther.——Work is going on at the St. Patrick mine and the men are busy grading for the mill.——Work has commenced at the American Hill gravel mine, with L. Phelps as Supt.——Wm. Hogan has four men at the Prolific quartz mine.——J. Jewell has found rich gold rock in a vein on his place on Deer creek, near the California mine.

Orange.

Test wells are being bored for petroleum on the Irvine ranch. The formation underlying a large area of this property is oil-bearing elsewhere in southern California, and it is thought probable that petroleum may be found here also.

Plumas.

A number of men are working in the Plumas Eureka mine on tribute.

Quincy *Bulletin*: Last week Thomas & Werner began crushing ore at the Bell mill, north of Quincy. The ore comes from an extension of the Bell mine and some of it is reported to be rich.——Packer & Son have sixteen men at work in the Alturas claim on Slate creek.——The Plumas Development Co. have their pipe in place and will commence operation as soon as their restraining dam is finished.——The hoisting works of the Jamison mine at Johnsville were recently burned. ——The copper prospects near Taylorville are being investigated by A. B. Summers, who has two crews of men at work on various claims.

Placer.

Colfax *Sentinel*: Three men are doing development work at the Redstone mine, two miles east of Blue Canyon. The tunnel is in 300 feet and the ledge averages 5 feet. Some rich chutes of ore have been encountered. The property is equipped with a 10-stamp mill and concentrators. N. B. Willy of Idaho is Supt. ——The Alder Creek M. Co. of Des Moines, Iowa, is operating the Van Avery mine, one mile east of Blue Canyon. The ledge is 5 feet. Tunnels Nos. 1 and 2 have been driven in 300 feet each. L. Balliett is Supt.——The Haub drift gravel mine, near Shady Run, is being worked on a lease by C. C. Haub and R. Watson. Five men are employed and twenty cars of gravel are mined each day, which average $2 per car. The tunnel is in 1200 feet. The mine is worked through chutes extending to gravel 35 feet above the tunnel. The channel is 1000 feet in width and contains white, free washing gravel. The mine has long been a producer.——The Cedar Creek drift gravel mine is three-fourths of a mile below Shady Run on the same channel as the Haub mine. The gravel was struck in the channel above the main tunnel, which is now in 1300 feet. The main tunnel is being driven; W. J. Davis, Jr., is Supt.——The Golden West mine, owned by R. H. Lloyd of San Francisco, is situated on the south side of the North Fork of the American river, five miles south of Blue Canyon. The ledge is 200 feet wide. A large amount of development work has been done on the mine. Operations will be commenced within thirty days under the direction of J. B. Khapp of Blue Canyon. A tunnel will be started 40 feet above high water mark. Mr. Lloyd has located a water right appropriating 1000 inches. A 5-foot flume from the dam site, 1600 feet to the mill site, will give a fall of 32 feet.——The Blue Canyon M. & D. Co. have their tunnel at the Azalea drift gravel mine in 1560 feet. They make from 4½ to 5 feet per day. The property consists of 690 acres of land, well timbered. The company has a bond on a portion of the channel above their holdings. Water with a pressure of 200 feet is used to run the 9-foot Pelton wheel, which drives a 10½x14-inch compressor. A power drill is used in the tunnel, which is timbered for the first 84 feet, the rest in solid bedrock. The company employ six men, working two shifts. I. M. McKay is foreman. The estimated distance to the channel is 2500 feet.

Riverside.

New Era: From Jan. 1st, '99, to April 22d, three months and twenty-two days, Hook Bros. have shipped to Los Angeles gold bricks valued at $12,900, extracted from the tailings from the Good Hope and Santa Rosa mines, which at one time were considered of no value. They are now put through the cyanide process. At each of the above mines there are thousands of tons of tailings, and it is estimated that the yield will reach $100,000.

San Bernardino.

(Special Correspondence). — The Imperial lode is a silver bearing vein in the Lava Beds district, thirty-six miles east of Daggett. It is 4 to 60 feet wide and outcrops along the surface for 8000 feet, standing above the softer country rocks 20 to 80 feet in height like a wall. It ends abruptly at its western end. A large amount of work has been done on the vein, and some rich ore found. There are several shoots of low-grade rock of considerable extent. There are numerous branching veins, which sometimes carry gold. When silver was worth $1.20 per ounce silver ore was shipped from this lode at a profit. It has been idle for a long time.

Daggett, May 2nd, '99.

It is reported that A. G. Campbell, owner of the Gold Bar, Saint George and Boomerang group of mines at Vanderbilt, has refused an offer of $300,000 for the property.

There are large deposits of low-grade copper ore in several of the mining districts in the eastern part of this county.

San Diego.

In the Cargo Muchacho mountains, four miles east from Hedges and four miles from Ogilby, are situated the group of mines owned by the American Girl G. M. Co., of which H. H. Markham, ex-Governor of California, is at the head. The ore is worked by roller crushers and the cyanide process. The rollers are equal to about a 25-stamp mill. There are three kinds of ore—talc, quartz and clay. There is about 10 feet of clay that follows the ledge of quartz. For a long time it was overlooked and considered worthless, but a chance assay showed it to be the richest of all. This cyanide plant has been working the clay by a process which overcomes the difficulty in percolation, under the direction of T. B. Bassett, who is superintending the process.

Colorado men have been inspecting the Owens mine at Julian with a view to purchase.

Ramona *Sentinel*: D. W. Godfrey is hauling rock from the Hidden Treasure mine to the Ready Relief mill to be crushed for Luther & Bailey.

San Bernardino *Sun*: The Southern Pacific Railway Co. has a surveying party running a line from Bagdad on the Atlantic and Pacific to either Whitewater or Palm Springs and are now near Dale City. The line will go close to Dale City, and touch at Surprise springs, Twenty-nine Palms, Warren's ranch, through Little Morongo pass to the Southern Pacific road.——Three mines are in operation at Vanderbilt.——Drennan & Jennings, who own a mine in the Black Metal district, forty miles below Needles, are negotiating for the sale of their claims.

Shasta.

A rich ore body has been found in the Globe claim, near Copper City, twenty-two miles east of Redding. It is not base ore, the rock carrying free gold and silver, with copper preponderating. Assays of the rock return $40 per ton.

Redding *Searchlight*: The Mountain Copper Co. has published its second annual report. It shows an expenditure of £35,288 in California and £487 in New Jersey during '98. The net profits amount to £163,235, against £63,145 in '97. A dividend of 7½% has been declared. The quantity of ore taken out was 221,895 tons, averaging 8.42% copper, against 165,060 tons averaging 8.56% copper—an increase of 56,835 tons. The quantity of ore smelted was 168,541 tons, producing 10,721 tons copper, against 97,835 tons, producing 7238 tons matte, in '97. This is an increase of 71,356 tons of ore and 3483 tons of matte. The quantity of finished copper marketed was 8273 tons, against 6025 tons in '97—an increase of 2248 tons.

Siskiyou.

Cottonwood creek is being prospected with drills.

The mill at the Cherry Hill mine, Cherry Creek, is in operation.

The tailings from the Jillson & Roberts mine at Hornbrook are being treated by the cyanide process by J. Palmer.

Trinity.

The Trinity Center Co. will put in a dredge on Trinity river, two miles above Trinity Center.

Sixty men are employed on the Nash mine doing development work.

W. B. Frue, Jr., will put in a 40-stamp mill to treat the product of his mine near Carrville.

The sale of the Copper Queen group of mines, five miles north of Trinity Center, has been consummated. The purchasers are B. Brown of Napa, and Schuppert & Buckman, owners of the Old Spanish mine of Shasta county, also of Napa. The sellers are W.

Vollmers, T. Baker, F. Dimmock and E. Ellery. Strode Bros. of Trinity Center will put in five more stamps.

Twenty men are employed at the Bloss & McClary gravel mines. It is expected to wash nine acres of ground.

It is reported that a strike has been made on the lower levels of the Altoona quicksilver mine. The mine is producing ten flasks of quicksilver daily.

COLORADO.

BOULDER COUNTY.

In Ward district mining operations are beginning to show activity. The Copper Glance has opened at the bottom of a 30-foot shaft 18 inches of mineral in which are two streaks of solid iron, each 3 inches wide, that run two and one-half ounces gold and four ounces silver.——The Binford mill has been leased by M. Bertolin, and is being put in repair. A 30-horse water motor will take the place of the steam plant.——W. Brainerd has commenced work at Camp Talcott and will put fifteen men on. Work will be confined to sinking on the Coy and Polar Star shafts and driving the Alaska tunnel.

CLEAR CREEK COUNTY.

Herald: Johnson & Segstrom, leasing the Johnson mine, have shipped ore which ran well in gold and silver.——W. Rogers, Sr., W. Rogers, Jr., W. Quick and R. Rogers, leasing on the Paymaster mine, in the Argentine district, have a 5-inch streak of ore, running from 50% to 60% lead and forty ounces silver per ton. Shipments are delayed on account of the snow.——The Stevens mine this week produced twelve tons of high-grade ore, and there are fifty tons at the mine to be hauled as soon as roads permit. Wolfe, Robeson & Seifried contemplate improvements as soon as timbers, wood, provisions, etc., can be hauled up.

Denver *Republican*: L. L. Oliver, who is working the Toledo, is shipping copper ore which he finds at the east end of the Toledo workings. Some ore running ten ounces gold per ton has been mined.——A contract has been let for driving the Lost adit. This is being driven for the purpose of reaching the ore body disclosed in workings ahead of the adit, on the same vein. The same parties are working placer ground near the mouth of the adit on Clear creek.——The ore body in the Perkins tunnel continues to improve. A wagon road is now building from the tunnel to Chicago creek.——Owen, Burns & Wood have made a shipment of a carload of ore from the Eclipse mine which ran $250 a ton. They will ship second-class ore during the week.——Riley Bros. have opened a streak of first-class ore at the Franklin mine. They will drift ahead and raise on this ore.——The bodies of zinc ore in the Mendota and other properties at Silver Plume are attracting attention from owners of zinc smelters. For years large amounts of zinc ore have been left in the mines. Streaks of ore, from 1 foot to 3 feet, were either left standing in the mines or thrown over the dumps. F. A. Maxwell of Georgetown has leased the Mendota, Frostburg and other lodes belonging to the Mendota group, from the Victoria tunnel level to the surface, together with the dumps of these properties. Mr. Maxwell intends to erect a concentrating mill and take out the low-grade streaks which are still in the mine. The mill when completed will have a capacity of seventy-five tons daily, and it will be the first mill of its kind erected in this camp.——A small streak of good ore has been opened by Proutt & Sons in their lease on the Terrible, which they are working through the Union tunnel. But little work has been done for several years on this mine.

FREMONT COUNTY.

Denver *Republican*: Dawson camp is one of the camps in the State that has developed in a few months into a steady producer. The Copper King has been shipping for several months to the zinc smelter at Canyon City, ore averaging $10 per ton. Last week 100 tons were shipped, and with a hand power drill the output will be increased to twenty-five tons per day. It is claimed that rich ore has been uncovered.——The Metallic King is putting in a steam hoist, which will be in operation by June 1st. A shipment of 2000 pounds taken from across a 12-foot vein, shipped to Canyon City smelter, gave returns of $14 in gold, silver and copper, and a 2-foot streak assays $40 in gold.——The Sentinel, at the depth of 40 feet, has pay ore. The copper values have paid from the surface, and the gold values range from $2 to $40 to the ton.——The Copper Boy is making shipments that yield good returns from the low-grade ore, and some of the ore is high-grade. A large body of ore has been opened.

GILPIN COUNTY.

Ore shipments from Blackhawk for the week ending May 8th, '99, aggregated ninety-two carloads.

The Concrete mine shipped 1500 tons of ore in the month of April, all of which was milled at Blackhawk.

The Kansas-Burroughs shipped 3475 tons of ore in April.

The Cook M. Co. shipped 385 tons of smelting ore and 2800 tons of milling ore during the month of April.

HINSDALE COUNTY.

Lake City *Times*: Mgr. Farrell of the Leslie mine has a specimen of gray copper ore which will be sent to the Paris Exposition.——S. D. Nicholson, accompanied by Civil Engineer Jacox of Leadville, has been looking over the Auric Co.'s property, upon which costly improvements will be made.——It is stated that ten tons of high-grade ore will be shipped daily from the Superior group, at Carson, as soon as the road is open.——Mr. Bardwell will put three men to work on the Neptune, in Casa Grande gulch, to get out a carload of ore.——Several veins are said to have been cut by the Meidrum tunnel. Prospecting on these will be started, and, as soon as the extent and value of the ore is known, a reduction plant is to be erected at the Telluride end of the tunnel.

MONTROSE COUNTY.

W. H. Tibbals and associates of Salt Lake City, Utah, recently received an offer of $40,000 for three claims in the La Sal mountains from P. McCourt of Denver and have accepted the proposition. The contract provides for the payment of $10,000 in July, $10,000 in January next and the balance before Jan. 1, 1901. The owners have expended less than $200 on the ground.

J. N. McBride has sold to the La Sal Copper M. Co., for $100,000, the Red Bird, Red Chief, Angell, Bennio, Horseshoe, Malachite, Maud, Titan, Cumberland, Canon, Deer, Silver Bell, Detroit, White Pine and Lulu lode claims and several mill sites in Paradox valley. This group comprises the property worked last year by the La Sal Co. on La Sal creek. The company has been shipping for months, the ore netting $980 per car.

OURAY COUNTY.

Ouray *Herald*: During winter the Maud S., Monona and Brooklyn, properties of Senator Newman, have been worked; 150,000 tons of copper sulphide have been blocked out, the ore vein being 7 feet. The ore runs from $5 to $15.——The Pueblo lode, near Ironton, is being worked by leasers, who have lead-copper ore uncovered running $40. This ore concentrates five tons into one. The Beaver & Belfast group has been worked all winter by Paquin & Tucker. They have been drifting.——The Bob Tail, in Commodore gulch, owned in Titusville, Pa., is bringing to the surface lead and copper sulphides, the values ranging from $10 to $50.——The Gennessee-Vanderbilt, worked by Haynes & Ryan, has eight carloads of ore which will run 25% copper.——Davy & Terrel, working the Silver Bell under lease, have fifteen cars of gray copper ore as a result of their winter's work. A 10-ton car last fall brought $90.——A. C. King, working the Mountain Lion lode, on the Red Mountain side, has opened a body of silver and gold ore. The average test of a 3-foot streak was 260 ounces silver and 1½ ounces in gold. Shipments will commence in June.——A. Rice & Son have commenced work on the Comstock lode in Galena gulch. They have a body of copper sulphide.

TELLER COUNTY.

(Special Correspondence).—The Mary McKinney group of mines, at Anaconda, is being developed rapidly and will soon be in position to ship 3000 tons of ore per month. The workings through five shafts, from 250 to 280 feet deep, extend along the course of the parallel ledges for 2000 feet. Drifts on the veins at 75-foot stations connect each shaft with the others. The two main parallel veins are 40 feet apart, with numerous crossing stringers of ore connecting, this condition admitting of a great amount of profitable work in ground contiguous to the principal vertical veins. There are five leases on the property which ship from 700 to 900 tons per month. In the district generally ores below two ounces gold in value are regarded as milling ore; all of higher grade are rated as smelting ore. In the Mary McKinney the two classes of ore are divided about equally. The equipment of the Mary McKinney is modern and substantial. The 150 H. P. hoist, 20x20 compressor, the four boilers of 125 H. P. each were put in by the Hendrie & Bolthoff Mfg. & Supply Co. The gallows-frame of heavy timber is 80 feet high, with no splicing. The ore house and shaft house, under one roof, is 80x190 feet, within which is also a machine shop. The building is covered with sheet iron. The work is under the direction of Supt. G. L. Keener, with C. C. Lewis master mechanic.

The Mary Jane, on Raven hill, belonging to the Advance Bonding & Leasing Co., is sinking a shaft with the expectation of cutting the Jack Pot vein at a little over 200 feet. This is one of the many small properties in the district which is equipped with an electric hoist.

The Tornado, on Raven hill, recently fitted out with new machinery, has been shipping for the past sixteen months and produces 200 tons per month, all of such grade as to justify shipment to the smelters. F. M. Wright is Supt.

The Raven mine has some interesting development. Its main shaft sinks from near the summit of Raven hill to a depth of 675 feet, at the bottom of which it connects with the 3000-foot tunnel from Squaw gulch. Near the breast of this tunnel is a hoist used in sinking a winze on the vein. Tunnel No. 2, from the opposite side of the hill, connects with the other tunnel and main shaft. This property is shipping 450 to 500 tons of ore per month, to the cyanide mills. The ores run from 1½ to 2 ounces. M. F. Stark is Supt.

The Badger Boy, on Globe hill, is being developed by the Greater Gold Belt M. Co., under the management of O. P. Hine. A 300-foot shaft cuts the vein, from which some high-grade ore is being shipped.

The Anchoria-Leland, on Gold hill, whose shaft is 870 feet deep, is shipping an average of 450 tons per month, most of which goes to the smelters.

The plant of the Oneida Reduction & Mining Co., near Victor, is almost complete. This is known as the Murphy process, which was developed by Fraser & Chalmers. It combines fine pulverization, roasting and amalgamation, having crushers, rolls, roasting furnace and a modified system of pans and settlers. Its capacity is about seventy-tons per day. A. C. Seiboth is manager of construction.

The Victor mine, one of the Pioneers of Bull hill, is shipping 2000 tons per month to the cyanide works. The management is now paying special attention to development. They are driving drifts into new territory. The mine will soon be supplied with electric power from La Belle M., W. & Power Co. at Goldfield.

The Doctor mine, on Raven hill, which was closed for several months by reason of litigation, is to resume work. This property has a record of high production. It belongs to Dr. J. J. Cone and Lyman Robinson. WASCOTT.

Cripple Creek, Colo., May 12th, '99.

Victor *Record*: Smith, Phillips and Simmons, who recently leased the New Zealand, made a strike of ore last week in a new shaft. Assays taken from talc gave values of from $400 to $600 to the ton. There is also considerable low-grade ore.——A 2-inch streak of ore has been encountered in the Damon, said to assay up into the thousands. This ore was found on the hanging wall of the 17-foot vein. The shaft will be sunk to a depth of 200 feet, at which point another level will be started.——T. J. Moynahan, lessee and manager of the Los Angeles mine, has offered $20,000 cash or guaranteed to sink the working shaft 300 feet in return for an extension of his lease. The offer was refused. Moynahan's lease expires on November 1st.——Four carloads of ore were sent out each week from the Horn, Rose and Hanson lease on the south end of the Deadwood. The ore is smelting grade.——Ore has been found in the tenth level of the Lafayette carrying sylvanite and free gold and a test made recently returned an average of $120 per ton. The claim is operated under bond and lease by the Princess Alice Co.——The Last Dollar production for the month was twenty-nine carloads of cyanide ore and twelve carloads of high-grade ore.——Smelting ore is being mined from the east end of the Orizaba, located on Beacon Hill, the lessees drifting at a depth of 75 feet, the vein averaging 8 inches.——The shipment sent from the Foley & King lease on the Ocean Wave was settled for at $45 to the ton. The ore was from the 100 level where the vein is 5 feet wide.——The production from the Orpha May during April was 800 tons of five-ounce ore. A fifteen-ton shipment of $200 ore has been sent out from the Tanna & Pollock lease.

IDAHO.

The Conjecture M. Co., at Hope, is to have a 20-ton concentrator. The mill will probably be running by the end of May. Workmen are getting out timbers and preparing for the machinery. The vein has widened to 6 feet.

The Big Buffalo Co. is sinking; the shaft is down 60 feet. The next payment on the bond is due June 1st.

F. Brown is at Buffalo. He has men at work on the trail preparatory to starting his pack train. Mr. Brown claims that this trail will make the distance from Grangeville forty-four miles.

H. Schwartz, special agent of the United States Land Department, is at Buffalo to stop illegal mineral locations and to enforce regulations of the land office. He has served notice on all saloons that they must close.

A crosscut tunnel is being run on the St. Paul claim under Supt. Pooley.

Spokesman-Review: On the Clearwater near Agatha a ledge of blue granite and a ledge of white marble have been discovered and are being stripped for quarrying. The white marble is burned for lime. A lime kiln has been built. On the Snake river, twenty-five miles distant, another ledge of granite is being developed, some of which is finding a market in Lewiston.

MICHIGAN.

The Calumet & Hecla is running twenty of the twenty-two steam stamps in its two mills as compared with sixteen stamps one year ago, which calls for the mining and stamping of 5500 tons of rock daily, yielding 175 tons refined copper. This is practically the rate of production of the Anaconda last year.

MONTANA.

The Fisher Creek M. Co. is to build a 10-stamp mill, which has been ordered.

NEVADA.

After an enforced stoppage of removing the water from the lower levels of the Comstock, occasioned by the breaking of the surface pipes, two ejectors are again at work and at latest report the water had been quickly lowered to the point which had been reached when the break occurred, and both elevators were working steadily. The water was 166 feet below the Sutro tunnel level.

C. K. McCornick, H. Joseph and H. Peery, of Salt Lake, Utah, have taken an option on the Fifty-Six group, six miles north of Humboldt House on the line of the Southern Pacific. Samples from the group show metallic copper from a vein 60 feet wide.

Salt Lake *Tribune*: G. D. Bunch of Searchlight district reports that a Boston company has contracted to build an electric railway for transportation of ores from the camp to the Colorado river, twelve miles distant, where the mills are located. Prospectors have developed bodies of ore, rich in gold, silver and copper.

Virginia *Report*: Ten days ago a location was made south of Osceola by Gaby, Benton & Doyle of Salt Lake on a mineral known as hubnerite, used in the manufacture of steel. The vein is 2 to 4 feet wide and has been exposed for 400 feet on the line of the ledge and has granite walls.

Mohave *Miner*: The Sheep Trail mines have been sold to the New England & Arizona M. Co, the consideration being $100,000. The mines are situated in the Union Pass country, near the Colorado river. Two 20-stamp mills will be put up. A 10-stamp mill is now in operation.

Needles *Eye*: B. F. Hamilton has uncovered a copper prospect near Sandy and will soon ship pay ore.——Placer properties along the Colorado river are being worked by several companies and individuals, and locations have been made for over 200 miles.——The cyanide plant at El Dorado canyon is proving satisfactory.——At Good Springs machinery for leaching and chloridizing copper ores is being erected by a German company. One hundred men are employed.——At Valley Wells the World Co. have completed the two-stack smelter. There are 150 men employed.——On the Mormon road from St. Thomas to El Dorado canyon, ten miles from Colville, a DeLamar outfit has located a copper lead 5 feet in width which runs 55% copper, with a trace of gold and a few ounces of silver.

NEW MEXICO.

Silver City *Enterprise*: Operations on the Last Chance mine at Mogollon are to be resumed. The mill will be repaired and a run of 500 tons made.——Crawford & Derbyshire's concentrator at Santa Rita has been shut down for ten days while additional machinery is being put in.——The main shaft on the Romero mine has been pumped out and retimbered to the 200 level. The 100-foot level was found to have bodies of ore developed by 3000 feet of drifts. The 200-foot level has 5000 feet of drifts to be unwatered. The pump has been running full capacity the past ten days, and it is expected the 200-foot level will be reached in a few days. The Standard Oil Copper Syndicate is bearing the expense for the purpose of investigating the workings before purchasing.——Crawford & Derbyshire are sinking two shafts on the Yosemite mine at Santa Rita. From the old shaft seven tons of smelting ore is shipped daily, besides that which goes to their concentrating mill.——Bible & Jay have sunk a new shaft upon the Carraseo and tapped the old Spanish workings. They are taking out high-grade copper ore.——Ashton, Roach & Williams continue to take out copper ore from the Montoya lease. They have native copper ready for shipment; they have made a shipment of a carload of high-grade copper ore from their Romero lease.

Santa Fe *New Mexican*: The Old Abe mine, near White Oaks, was located in '83, and has been worked since '90. The new shaft is 1050 feet deep. From 850 to 900 feet all work was in ore, and at 1050 feet the paystreak was found with a short drift. All levels run north 200 feet and show a regular vein 8 to 13 inches wide, with an average value of $175 per ton. A number of seams from the vein have been followed and pockets of free-milling ore found. Near the surface specimens of wire gold in gypsum were found. J. Y. Hewitt is Mgr. There are 10,000 tons of tailings, worth $6 per ton. The mine is said to have produced $650,000.

OREGON.

The Standard Oil Co., who now own the Bonanza mine, near Baker City, it is reported, are to build a 100-stamp mill.

UTAH.

Additions are being made to the force of the Ontario mine, at Park City.

R. Smith has completed his contract on the Superior mine, at Park City, having drifted 400 feet from the lower crosscut tunnel on a vein of lead-silver ore, which has an average value of forty ounces silver and 40% lead. The company will open the gold-copper vein, which outcrops on the surface parallel with the lead vein. At one point an open cut, 30 feet in length, with a shaft 80 feet deep, shows an 8-foot vein of ore carrying from 5% to 25% copper, eight ounces silver, $4 gold and 40% iron.

The strike recently made at the Comstock mine, at Park, assayed 45% lead, sixty ounces silver, $4.60 gold and 7% copper.

At the Daly-West the force is being increased daily, and a night shift is being put on in the mill, with E. Buckley in charge. There are now 300 tons of concentrates and 1000 tons of first-class ore awaiting shipment.

J. Green, from the Naildriver, reports that at that property a small force is employed, but expects to increase it.

Barnes Bros., Girard & Daniels and Nelson & Wright are operating jigs in Woodside canyon.

The new Silver King mill has commenced a test run.

Engineers have been surveying the site for the new Anchor mill at Park.

Cooney Bros. added a new set of slime tables to their plant in Woodside canyon recently. They are preparing for an active summer's work and expect to make more than wages.

T. Brubach has offered the Morgan M. Co. at Park City $100,000 for their property, adjoining that of the Daly-West on the north. The workings on it have attained a depth of 800 feet, but no ores have been marketed.

Lowe & Barnett of Salt Lake City have bought the Calumet group of seven claims in the North Star district, below Milford, and let a contract to sink 100 feet. Assays from the ore show 4% to 11.5% copper and $1.25 to $13.40 gold.

The Cleopatra M. Co., whose property is at Silver City, has placed an order for a hoisting plant that will enable it to go down 1200 feet. Development will be under direction of C. V. Allen. The shaft is down 200 feet, from which level prospecting will begin.

Discoveries of copper in the eastern part of Emery county have been made. The find is a blanket vein. Returns from Salt Lake City show values of $43.60 in gold, copper and silver. The discoveries are six miles from the railroad.

WASHINGTON.

Three quartz locations have been recorded by S. C. Hendrix at Spokane for the Wild Temple, Long Tom and Tin Horn mica lodes, a mile and a half northwest of Newman lake, near Spokane.

It is reported good ore is being found in the Nevada claim, on Lone Pine hill, at Republic.

Spokesman-Review: An extra shift has been put on at the Q. S., in Okanogan county, in the upper drift, and good ore is being stacked on the dump, the average assays running 14% copper and $10 in gold. S. E. Barron is Mgr.——The Little Six M. Co. has let a contract for 200 feet of tunnel, which will carry the tunnel in 300 feet. The company owns a group of silver claims located midway between Cedar Canyon and the Cleveland mine, in Stevens county. The tunnel, upon which work is to be resumed this week, will cut the vein at a depth of 300 feet.

Spokesman-Review: In Cedar canyon the Deer Trail and Royal, the first two claims located in the camp, are to commence shipping. The Royal is the north extension of

Deer Trail No. 2, which is paying dividends. n the Royal claim the vein dips with the hill and short tunnels have been driven to encounter the vein. Six of these have opened the ore for a length of 1400 feet, and the difference in depth between the highest and lowest tunnel is 300 feet. At no point have they failed to encounter the ore body. The vein lies in granite and porphyry and varies in width. The average is between 6 and 12 inches of ore, and where it is narrowest it is richest.

FOREIGN.

AUSTRALIA.

In the Northern Territory, on the property of the Northern Territories G. M. Association, known as the Terrors, the shaft is lined with structural steel, instead of timbers.

The Preamimma copper mine, six miles northeast of Callington, is to be reworked. This mine was discovered in 1854, and some ore, chiefly carbonate, produced. The property is to be worked mainly for arsenical pyrites, of which there is said to be an abundance.

Good progress is being made at the Wyacca copper mine, and more men have been put on. The vertical shaft is down 150 feet, and the lode in the bottom is between 3 and 4 feet wide. The shaft on the south lode is down 45 feet on a big body of ore.

The cost of production of copper at Wallaroo in 1898 was £49 14s 9d per ton. This leaves a margin of profit at the present price of copper, but would leave none if the old rates ruled.

BRITISH COLUMBIA.

Work has been resumed on the Deer Park with sixteen men under the superintendency of W. Tregear. A crosscut will be run to the ledge from the bottom of the 300-foot shaft.

Samples of ore taken from the bottom of the shaft of the Sullivan mine near Fort Steele run 63% lead and thirty-four ounces silver. The silver values have doubled since the shaft was started.

Another strike was made in the North Star mine recently. The ore was found in the drift on the 200-foot level.

G. Pfunder, Supt. of the Iron Horse, reports two strikes on the 300 level. For several days the crosscut has been in solid chalcopyrite and pyrrotite ore in quartz gangue 12 feet in width. This ledge is supposed to be the Le Roi. On the same level the west crosscut 50 feet from the bottom of the shaft has encountered the War Eagle ledge.

A strike in the Golden Eagle claim on Pass creek, eleven miles northeast of Greenwood, is reported. The claim is owned by L. S. M. Barrett and others. Assays run as high as $64 in a 4-foot lead.

Numbers of prospectors are fitting out at Greenwood for the West Fork of the Kettle river and the Similkameen.

McEntire, McDonnell & Co. have bonded from R. Wood the North Star in Long Lake camp, seven miles north of Greenwood.

Ore shipments from Rossland for the week ending May 13th amounted to 4345 tons. Total tons this year, 41,127.

Spokesman-Review: It is reported from Grand Forks that J. P. Graves, operating in the Boundary country for a Montreal syndicate, about to erect a smelter there, has selected a site on the north bank of the North Fork of Kettle river, one mile and a half from Grand Forks. The smelter will have a capacity of 500 tons per day with provision for a large increase. Work will begin in thirty days.

Rossland *Miner*: At the Center Star, at Rossland, men are timbering the main shaft from the 100 to the 300-foot level. A large ore bin is being erected. Upon its completion the mine will commence shipping to Trail. In the Center Star winze, on Iron Mask ground, the territory in dispute in the pending lawsuit, the 18 feet of sinking directed by the court to be done under D. J. Macdonald's management has been finished and connection has been made with the Iron Mask tunnel.——The ore shipments from Slocan lake points from Jan. 1st to May 1st were over 1000 tons. ——The first gold bricks have been shipped from the Ymir Co.'s mine to Nelson. They were valued at $10,000, and represent gold saved on the plates in a fifteen days' run. The company has $4000 in concentrates, making the output for the first fifteen days' run about $1000 per day.——The cleanup of the Athabasca mill for April was not up to expectations, due to trouble with the miners over the eight-hour law.

Spokesman-Review: Central or White's camp is north of the international boundary, about five miles from Columbia. There are two companies developing the holdings of the City of Paris G. M. Co. and the Lexington G. M. Co., both under the management of J. P. Graves of Spokane. H. White is Supt. and H. Johnson Mgr. Other properties in this camp are the No. 7, Jack of Spades, Golden Cache, St. Lawrence, Mabel and Oro, but these are not being worked on account of lack of transportation. The City of Paris group is equipped with a five-drill compressor and a boiler. This machinery is on the Oregon claim, adjacent to water. The air is piped up to the mine, a distance of 1000 feet. The mine employs sixteen men. For the Lexington a five-drill compressor plant has been ordered. On the surface the vein shows 8 feet of oxidized ore. The face of the tunnel is in solid pyrrhotite.——The Montreal claim is said to have a 15-foot ledge of quartz. Its development is in the way of a prospect shaft. ——On the surface of the City of Denver the ore is similar in character to that found on the City of Paris. A 45-foot shaft constitutes development.

LOWER CALIFORNIA.

Not since the Alamo excitement has there been such a stampede to a new placer camp as that which is now under way to the Santa Clara diggings, 400 miles south of San Diego, and fifteen miles back from the coast. Supt. Swayne of the Ibarra G. M. Co. at Calmalli, sent a runner 200 miles to San Quintin with a message to agents of the company, notifying them that the 200 men in the company's employ had gone to the Santa Clara diggings, leaving Calmalli deserted, and, in consequence, the Ibarra mines have been closed, and also notifying them not to ship machinery and freight for Calmalli, there being no means of getting it from the landing at Santa Domingo to Calmalli, sixty miles, all the men having gone to the new diggings. Santa Clara is a sparsely settled part of Lower California and has no communication with the outside world except by trail to Calmalli and to Santo Domingo, where the steamer touches every month. The first reports of the placer discovery were brought up three weeks ago. At that time there were said to be 800 men in the diggings, many having gone from Santa Rosalia, on the gulf coast.

Personal.

L. A. GROSS of San Francisco is in the East on mining business.

SCOFIELD & BROOKS have opened an assay office at Victor, Colo.

E. R. ABADIE AND DAVID MCKAY are visiting Grass Valley, Cal.

W. S. KEYES, E. M., has returned from a professional visit to Butte, Mont.

SIGNOR MARCONI expects to visit the United States the coming summer or fall.

W. E. JOHNSON, a Denver mining man, recently returned from the Pacific coast.

GEO. S. TAYLOR, a mine owner of Murphys, Cal., is in San Francisco, Cal., on business.

W. B. WILSON, Supt. of the Elkton mine, Cripple Creek district, has gone to Scotland.

J. W. DEAN, of Denver, Colo., returned from Boston lately and has now gone to Arizona.

M. M. VAN FLEET & Co. will soon open offices in Denver and Pueblo as ore factors and samplers.

FRANK M. WRIGHT is now Supt. of the Tornado mine on Raven Hill, Cripple Creek district.

PERCY L. SHUMAN, Mgr. of the Paragon Con. G. M. Co., near Railroad Flat, Cal., is in San Francisco, Cal.

BYRON E. SHEAR, of Denver, Colo., recently made an examination of some of the mines near Baker City, Oregon.

C. H. ATKINS of Colorado has been engaged in inspecting mines in the Julian and Banner districts, San Diego Co., Cal.

E. P. JENNINGS will have the direction of the development of the Dragon Iron mine at Bingham, Utah. He will also have charge of the Boston Con.

J. T. MILLIKEN, Supt. of the Colorado Reduction Co.'s chlorination mill in Cripple Creek district, recently visited the zinc-lead mines at Joplin, Mo.

HENRY BRATNOBER, who recently left the London Exploration Co., it is reported will open offices at Seattle and Skaguay for the purpose of promoting mines.

F. M. WATSON, until recently Gen. Mgr. Simmer & Jack mine at Johannesburg, S. A. R., has been appointed joint manager in South Africa of the Con. Gold Fields.

STILLMAN W. WHEELOCK, for the past five years with the Black Diamond Steel Works at Denver, Colo., has been appointed manager of the office of the Illinois Steel Co. at Denver.

FRANCIS E. DRAKE, American Director of Machinery and Electricity at the Paris Exposition, has arrived in New York from Paris. He says the work on the Exposition buildings is progressing satisfactorily.

MISS MOLLIE O'BRYAN, a stenographer and court reporter of Cripple Creek, Colo., recently cleared $5000 on investments in Isabella mining stock and she now owns the control in the Teutonic property on Bull Hill, for which she was offered and has refused about $20,000 cash.

Books Received.

"*The Characters of Crystals*," 211 pp., illustrated; Alfred J. Moses, E. M., Ph.D. A handsome volume, treating on the interesting science of crystallography, in which is described, simply and concisely, the methods and apparatus employed in studying the physical characters of crystals. The various phenomena observed are described in plain language, without complex mathematical discussions. The book treats of the geometrical characters of crystals, their optical characters and thermal, magnetic and electrical characteristics, etc. It will become a useful and popular volume in the hands of students of the interesting science of petrography. D. Van Nostrand & Co., New York City. Price $2.50.

"*Manual of Assaying*," 551 pp., illustrated; Walter Lee Brown; eighth edition. A compact, clear and comprehensive treatise on the assay of gold, silver, lead and copper. The several editions of this excellent little volume are noted for the thoroughness and simplicity with which the subject is treated. All errors appearing in previous editions have been corrected. The book treats of the apparatus used in assaying, reagents, determination and preliminary treatment of ores. A chapter is devoted to the volumetric method of assaying, and the appendix contains an interesting chapter on prospecting. E. H. Sargent & Co., Chicago. Price $2.50.

Catalogues Received.

THE Jeffrey Manufacturing Co., of Columbus, Ohio, has issued a handsomely illustrated catalogue, No. 16, of electric and compressed air coal mining machinery, particularly coal cutters, drills, motors and pumps.

Recent Mining Incorporations.

Arrow G. & S. M. Co., San Francisco; capital stock, $240,000—all subscribed; C. L. Fair, G. A. Knight, G. Dean, R. Stevenson, F. S. Knight.

Santa Ana Oil Co., Santa Ana, Orange county; capital stock $50,000, subscribed $15,000; M. M. Crookshank, J. Cribbon, R. F. Chilton, J. M. Dawson, W. B. Wall, all of Santa Ana.

Mountain View G. M. Co., Forest City, Sierra county; capital stock $10,000, all subscribed; T. E. Edwards, F. C. Davis, D. Devero, A. Mulligan, M. Davis, all of Forest City.

Occidental Oil Co., Fresno; capital stock $32,000, all subscribed; J. J. Vincent, W. Helm, E. A. Walrod, I. Miles, F. Cleary, R. J. Cooper, G. W. Prickett, E. W. Risley, C. B. Kemble, all of Fresno.

Mount Godard Oil Co., Fresno; capital stock $200,000, subscribed $8500; F. K. Prescott, M. K. Harris, W. N. Rohrer, C. A. Teefer, C. A. Murdoch, C. S. Pierce, B. F. Shepherd Jr., all of Fresno.

Black Diamond Oil Co., Hanford, Kings county; capital stock $32,000, subscribed $9000; W. Walker, J. Welcher, W. F. Harrison, C. E. Moore, L. Meyers, all of Hanford.

Little Tar Canyon Oil Co., Hanford, Kings county; capital stock $100,000, subscribed $68,000; L. S. Chittenden, F. L. Welding, E. Newman, W. J. Burnett, L. Nathan, all of Hanford.

Tecopa M. & S. Co., Los Angeles; capital stock $50,000, subscribed $40,000; D. W. Shanks, W. O. Dow, J. H. Fawcett, W. S. Porter, M. L. Graff, all of Los Angeles.

Industrial Notes.

—The Electric Storage Battery Co. of Philadelphia has increased its capital stock to the extent of $4,500,000, making its total capital stock $18,000,000. The company was incorporated in 1888 with a capitalization of $10,000,000.

—A syndicate of Colorado Springs capitalists, headed by W. S. Stratton, who recently sold the Independence mine in England for $10,000,000, has purchased the Cripple Creek District Electric Railroad, and will extend it immediately to Colorado Springs. It has twenty-five miles of track, reaching the principal mines.

—The Sacramento, Cal., Electric Railway Co., which is now transmitting 4000 H. P. from Folsom to Sacramento, is about to add the fifth 1000 H. P. unit, which will only partially supply the increasing demand at the receiving end of its system. The company has also contracted with the Yolo Electric Power Co. for 5000 H. P. more. A new plant will be constructed with a capacity of 15,000 H. P. The present dam will have to be enlarged and a reservoir constructed at the forebay with a capacity sufficient to furnish 10,000 H. P. for six days continuously at the normal head, which will be 688 feet. The overhead line to Sacramento will be of aluminum wire, worked at 40,000 volts pressure.

Recently Declared Mining Dividends.

Parrot Silver & Copper M. Co., Butte, Montana, $1.50; payable May 31.

Osceola Con. M. Co., $3 per share; payable June 15; being an increase of $1 over previous dividend.

Portland G. M. Co. of Cripple Creek, Colo., a monthly dividend of $60,000; May 15. To date $2,100,000.

Deer Trail No. 2 M. Co., Washington, regular dividend No. 12, $2500; May 15. Total $30,000.

Montana Ore Purchasing Co., extra $1 per share; payable at the New York office on May 24. Total $1,120,000 since Jan. 1, '95.

Commercial Paragraphs.

THE Edward P. Allis Co. of Milwaukee, Wis., has secured an order from the Dahlonega Con. G. M. Co., Dahlonega, Ga., for a 120-stamp mill, each stamp 850 pounds weight. The mill is also provided with hydraulic classifiers and thirty-six Reliance vanners, so that the pulp, after passing over three sections of copper plates, is sized in the classifiers and concentrated on the vanners. One large Gates crusher crushes all the ore for 120 stamps, which is distributed to the various bins by belt conveyors. The power for the mill is derived from two 6-foot Pelton water wheels, and the vanners are driven by Pelton water motors. The concentrates will be conveyed by an electric trolley road to the chlorination plant, the order for which was also given to the Allis Co. This plant is equipped with a Holthoff-Wethey roasting furnace, 10x100 feet, having a cooling floor attached, for cooling the ore after roasting and before chlorination takes place. There are two five-ton chlorinating barrels and the necessary tanks, etc., in the chlorination plant, which will treat at least thirty tons of concentrates in twenty-four hours. The Allis Co. were also given an order for a twelve-drill air compressor, with all the necessary drills, tools, etc., belonging thereto. This compressor will be located in the power room of the stamp mill. The chlorination plant is also driven by Pelton water wheel. It is expected that the two plants will be in operation by Sept. 1st of this year. This company has also received an order for a 10-stamp mill, with concentrators, from the Fisher Creek M. Co., which will be built in Libby creek district, Montana; also, an order for a 20-stamp mill complete from T. F. Walsh, through their Denver agency, to be built in Ouray, Colo.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MAY 9, 1899.

624,612.—SEPARATOR AND CONVEYOR—T. J. Barlow, S. F.
624,614.—EDUCATIONAL DEVICE—J. A. Bevington, Escondido, Cal.
624,745.—MITER BOX—F. Bootsman, Artic, Wash
624,627.—BOILER CLEANER—V. Clark, Dryad, Wash.
624,455.—PUFFING IRON—P. F. Clerc, S. F.
624,785 —PLOW—W. B. Gray, Ashland, Or.
624,618. — ROPEWAY CONVEYOR —A. S. Hallidie, S. F.
624,483. — WAVE MOTOR — Hamilton & Mahany, White Hills, Ariz.
624,669.—LUGGAGE CARRIER — V. L. Moore, San Rafael, Cal.
624,860.—CURTAIN FIXTURE—R. E. Phillips, Portland, Or.
624,689.—MOTOR VEHICLE—W. S. Schuyler, Oceanside, Cal.
624,594.—MOTIVE POWER — M. L. Wilkinson, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE LUGGAGE CARRIERS.—V. L. Moore, San Rafael, Cal. No. 624,629. Dated May 9, 1899. This invention relates to improvement in luggage carriers which are especially designed for use upon bicycles. It consists essentially of a flexible netting, a rectangular frame, to which the upper edge of the netting is secured, the lower portion being closed, a bar having curved hooks, and loops adapted to engage the handle bar and the vertical steering post of the machine, so as to secure it thereto, said bar having loops formed in its ends, which are engaged by corresponding loops or links in the net-carrying bar, whereby the latter is allowed to fold automatically, adjust itself with relation to the frame of the machine and to any load which may be placed in it.

CONVEYOR ATTACHMENT FOR ROPEWAYS.—A. S. Hallidie, San Francisco, Cal. No. 624,648. Dated May 9, 1899. This invention relates to a device by which buckets, hangers or load carriers are connected with endless wire ropes and is especially designed for such connection where the apparatus is employed as an aerial ropeway. The invention consists essentially of an arm having a journal at one end for the suspension of the hanger or part to be carried thereby and having the other end formed with a plurality of thin leaves drawn down so as to pass between the adjacent wires or strands of the rope and terminating in short sections which fit within the strand in the place ordinarily occupied by the core, or they may be made to embrace the core.

COMBINED GRAVITY SEPARATOR AND CONVEYOR.—Thos. J. Barbour, San Francisco, Cal. No. 624,612. Dated May 9, 1899. This invention relates to an apparatus which is designed for the purpose of separating light and heavy material and to a means for delivering the separated materials of different specific gravity at different points with relation to the apparatus. It consists essentially of a receptacle having an elongated bottom and vertical sides, a feed device at the upper end and a discharge at the top of the lower end, a chamber or well extending vertically below the bottom proximate to the discharge and in which the lower end of the inclined bottom terminates to receive heavier material therefrom, means for supplying water to the receptacle whereby the lighter material overflows therewith at the discharge, a screw conveyor and an enclosing casing therefor exterior to the receptacle, said conveyor having its receiving end entering the conveyor or well at a point above its bottom so that material of intermediate specific gravity is conveyed out of the chamber or well and is discharged at the opposite end of the conveyor. In conjunction with the feed mechanism a rotary screen is employed by which the material is separated and classified, a conveyor by which the larger portions are moved from the screen without passing through the other part of the apparatus, while the portion which passes through the screen is delivered by a chute into the main portion of the machine.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MANUFACTURERS OF

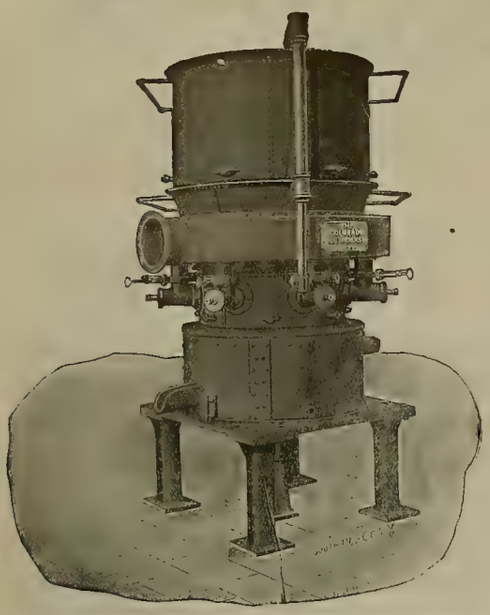
Smelting Furnaces and Equipments

For the Treatment of

GOLD, SILVER, LEAD, COPPER and PYRITIC ORES.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



A MODERN COPPER SMELTER (ROUND FORM).

(SEE PAGE 552.)

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

WOODBUYR'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. CAPACITY FROM 5 TO 10 STAMPS.

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

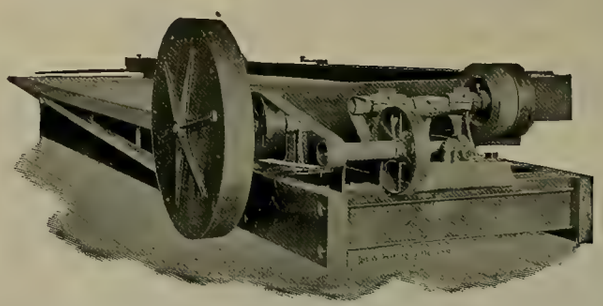
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

RIVETED SHEET STEEL WATER PIPE

For Placers, Water Powers, Irrigation, Etc.

THE WEIGELE PIPE WORKS

2949-51 Larimer St. DENVER, COLO.

The Jeanesville Mining Pump.

The pump illustrated herewith was built by the Jeanesville Iron Works Company of Jeanesville, Pa., for the Yellow Aster Mining and Milling Company of Randsburg, California, and has a capacity of 300 gallons a minute; the discharge pipe being 5 inches in diameter and 6 miles long.

The water pressure at the pump is 375 pounds to the square inch. This water end is a special design, pot valve pattern, intended for high lifts of 500 to 1200 feet.

As the efficiency of a complete machine is made up and determined by the efficiency of each detail, so the design of a modern mine pump becomes a study in detail of each distinct part. In former times only general results were looked for; a pump delivering the required amount of water was accepted. The mining engineer of to-day, however, not only calls for volume and height of discharge, but specifies features relating to steam consumption, simplicity, accessibility, material used and many other items relative to the general efficiency of the machine.

Figs. 1 and 2 illustrate one of the latest products from the shops of this company. The general design contemplates a pump suitable for pressures of from 500 to 800 pounds per square inch, which is compact, simple in construction and absolutely safe to perform the necessary work with a minimum of attention and repairs.

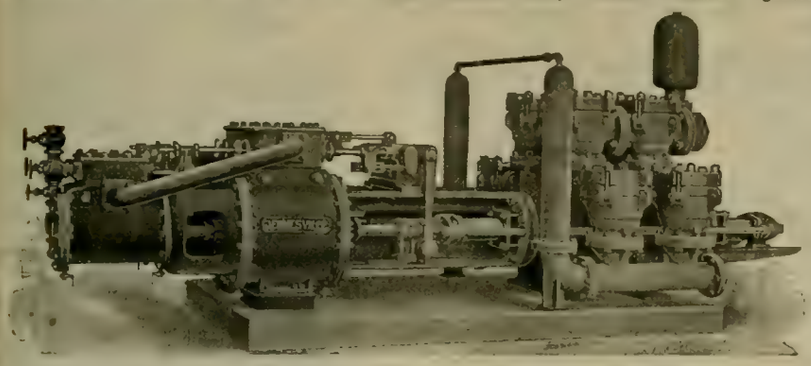

FIG. 1.

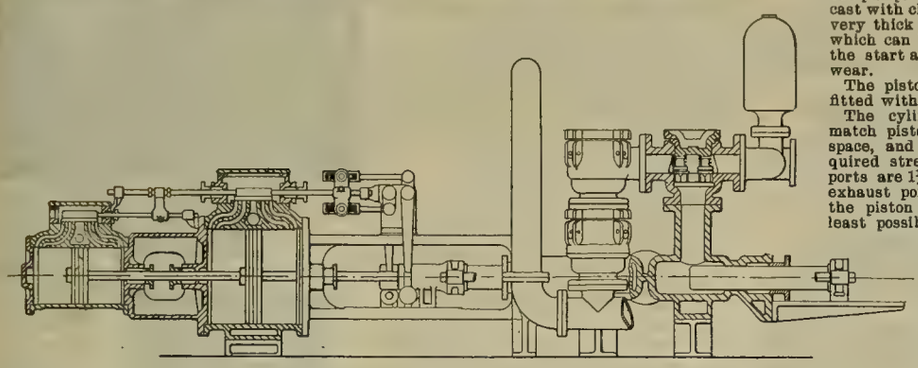

FIG. 2.

Referring to the illustration, Fig. 1, and the sectional elevation, Fig. 2, the commanding features of the detail of construction may be cited as follows:

The steam cylinders in this line of pumps are always compounded, thus insuring maximum steam expansion, high and uniform piston speed, which produces continuous and uniform discharge to the water column. The high and low pressure cylinders are connected by a yoke or cradle, and steam end complete rest upon low pressure cylinder bed plates, which arrangement allows expansion and contraction in high pressure cylinders not to interfere with the alignment of the pump. The steam cylinders are cast with close grained iron and with very thick walls, insuring a cylinder which can be accurately finished in the start and rebored after years of wear.

The pistons are hollow cored and fitted with cast iron spring rings.

The cylinder heads are faced to match pistons to take up clearance space, and ribbed outside to give required strength. The inlet steam ports are 1¼% to 2% and the outlet exhaust ports are from 3% to 4% of the piston area; this provides the least possible friction of steam, in pressing into and out of cylinder.

The valve motion is of the well known duplex type with improved outside adjustment for equalizing the stroke in the two cylinders.

A heavy rigid cradle connects the steam and water end, giving a substantial support to valve to plunger crossheads. The working barrels are made with long packing and plunger-bearing surfaces at each end.

The central divide in water cylinder is made by two spherical partitions connected by webs on the outside; the usual construction at this point is a single web, either inserted or cast with the cylinders. This revised arrangement gives greater strength and certainty of sound casting.

The valve pots or chambers are bolted upon the side and top of flanges of the working barrels and are connected with the suction and discharge piping; each pot or chamber is arranged with cover held in position by hinge bolts, for examination of the working valves.

One of the most important details of an efficient pump are the valves, and it is claimed from test and working of the pump, that the arrangement and design of valves used are as near perfection as it is possible to produce.

The valves proper work upon a bronze seating with a flat face and the cone shape of the poppets admits the water with the least friction. The combined area of each section is epual to from 50% to 75% of the plunger area. This large area allows the pump to work economically, with the valves at a minimum lift. The wing poppet valves are faced with either rubber or leather as may be desired.

The plungers are cast on end and are connected by extra large parallel rods, which serve the double purpose of carrying working strain and also to give rigidity, so that the weight of the plungers are distributed on the guides at either end of the working barrels; this relieves the stuffing boxes of the heavy weight of the plungers.

At dead end of each suction pipe is placed a large vacuum chamber, which contributes materially to the smooth running of the pump, by always maintaining a volume of water to be taken into the working barrels at the expiration of each stroke.

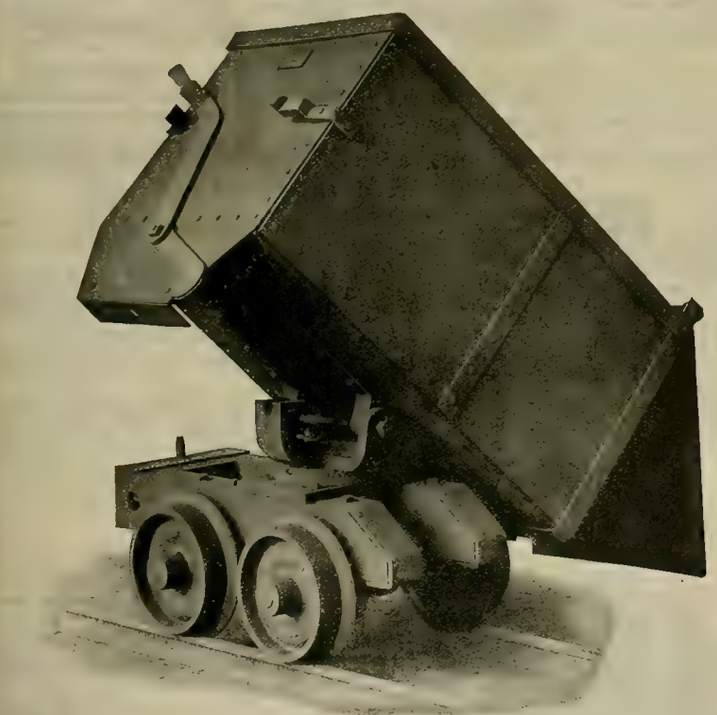
The fittings are complete, including all the wrenches, steam valves, gauges, oilers and spanners, necessary to make a quick inspection of the parts. The pump as a whole presents a compact and neat appearance and is fitted with well proportioned supports for resting on foundation.

The western office is at 1328 Seventeenth St., Denver, Colorado, A. Middlebrook, manager. *

The Standard Ore Car.

The accompanying illustration is of the Standard ore car, manufactured by the American Engineering Works, 204 Dearborn St., Chicago, Ill. Code word: Zangvogel. The cut shows a Standard ore car with Anaconda patent self-oiling axles and wheels, which is being used in many of the largest mines in this country and giving universal satisfaction.

The dimensions of the car as shown are:



Shipping weight, 1000 pounds; capacity, 16 cubic feet; wheel diameter, 12 inches; gauge, 18 inches; height over all from top of rail, 4 feet ¼ inch; height from top of box to top of rail, 3 feet 9½ inches.

Dimensions of box: Depth, 24 inches; width, 26 inches; length, 44 inches; thickness of sides, 3-16 inch; thickness of bottom, 5-10 inch.

These cars are furnished with whatever sized wheels may be desired, also for 18, 20, 22 or 24-inch gauge track.

The car body rests on a heavy cast-iron bolster and turntable, the latter being securely bolted to the truck. This permits of the car being swung in any direction desired, and the contents dumped sideways or endways. The discharge door in front is hinged at the top and operated from the rear end, with a wrought-iron handle fixed to the latch rod which runs under the car body, and by means of which the car can be exactly locked or unlocked as desired.

The sides and bottom of the car can be made of any thickness of steel desired. In the Standard car 3-16-inch is used for sides and 5-16-inch for bottom. All corners are reinforced with 2-inch angle iron, and the top and sides are stiffened with heavy steel bands and straps. The patent self-oiling axles are let into the frame and bolted strongly thereto. The workmanship, quality of material and details of the car are of the best. The car is guaranteed to stand the severest kind of work.

It is the endeavor to always carry in stock a number of Standard cars with 12-inch wheels for 18-inch gauge. Some of these cars are built with steel frame, using channel iron instead of wood, as shown in cut. *

History of the Rand Mining District of California.

Geo. W. McPherson, an old resident of the town of Randsburg and at present Secretary of the District Board of Trade, and one who is thoroughly familiar with the vast mineral resources of that part of California, has just published a very large and highly-illustrated book, in which he gives a complete history and description of the Rand mining district. The cover is printed in three colors, and the half-tone views of the various mines and town scenes are of the very best, and, as the paper used is a fine quality of coated book, they give a splendid idea of the scenes they represent. The book is certainly well written and is beyond doubt one of the finest and most extensive ever published on the resources of any mining district, and anyone desiring to have a complete knowledge of the mines and general mineral resources of that much-talked of district should have a copy. It has been placed on sale with the leading news agents of San Francisco and is selling readily for 50 cents per copy, or will be forwarded by addressing Geo. W. McPherson, Box 71, Murphy Bldg., San Francisco, Cal. *

PACIFIC EXPLORATION COMPANY
Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited.
W. E. Holbrook, Pres't. L. F. Haskell, Sec'y.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 180 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated..... ...$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid..... ..50c

GEOLOGY:
Emmons, $1 50; Le Conte, revised edition, $4; Dana, 4th edition.....$5

IRON AND STEEL:
Thurston, 6th edition.....$3 50

LITHOLOGY:
Williams, 2nd edition.. .....$3

HYDRAULIC GOLD MINING:
Kirkpatric.....$1

LIEBER'S CODE:
Bound in leather.....$3

MINERALS:
"How to Study Them," Dana, 2nd edition, $1 50; Dana, American locality of mineral, 6th edition.....$1

ASSAYING:
Furman, 4th edition... ....$3

HIGH EXPLOSIVES:
Eissler.....$4

GOLD ORES:
Treatment of; O'Driscoll.....$2

MINERALOGY:
Brush & Penfield, revised edition, $4; Dana, 6th edition, $12 50; Dana, for beginners, $1 50; Dana, Mineralogy and Petrography, 12th edition.....$2

METALLURGY:
Eggleston, Silver, Gold and Mercury, 2 vols.$15

TUNNELING:
Blasting, Timbering, Air Drilling, etc.; 1000 illustrations; Drinker, 3rd edition.....$25

CHLORINATION PROCESS:
E. B. Wilson.....$1 50

HYDRAULIC AND PLACER MINING:
E. B. Wilson.....$2

ALLOYS:
Thurston, 2nd edition.....$2 50

CRUSHING ROLLS.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Ca

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experience first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1899, an assessment (No. 13) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth day of May, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the fourteenth day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

BADGER HILL AND CHEROKEE GRAVEL MINing Company.—Location of principal place of business, San Francisco, California; location of works, Cherokee, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of May, 1899, an assessment of Three Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1899, an assessment (No. 18) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 17th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of May, 1899, an assessment (No. 13) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899 to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of May, 1899, an assessment (No. 19) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3rd day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

The Regular Annual Meeting of the Stockholders of the NATIONAL CON. MINING CO. will be held at the office of the Company, 773 Mission St., San Francisco, California, on MONDAY, the 5th day of June, 1899, at the hour of 8 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

NOTICE.

SALE OF THE BUNKER HILL AND MAYflower Mines Amador, Amador County, Cal., by the Receiver of the Spring Garden National Bank of Philadelphia, Pa.

Public notice is hereby given that the mining properties known as the Bunker Hill and Mayflower Gold Mines, situated near Amador, in the County of Amador, State of California, on what is known as the "mother lode," belonging to this trust, will be sold at public auction, together with all water rights and privileges, mill sites, hoisting works, railroads and rolling stock, buildings, machinery and appurtenances belonging thereto, at the United States Custom House, San Francisco, California, THURSDAY, June 8, 1899, at 11 o'clock A. M.

Circulars containing general description of the property and particulars as to conditions of sale etc., furnished on application to

J. FRANK ALDRICH, Receiver,
Room 33, Wyatt Building
Washington, D. C.

Standard Ore Car

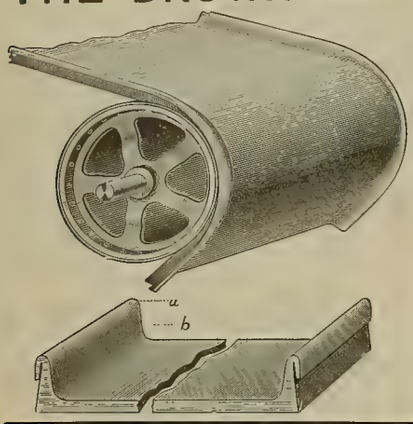
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

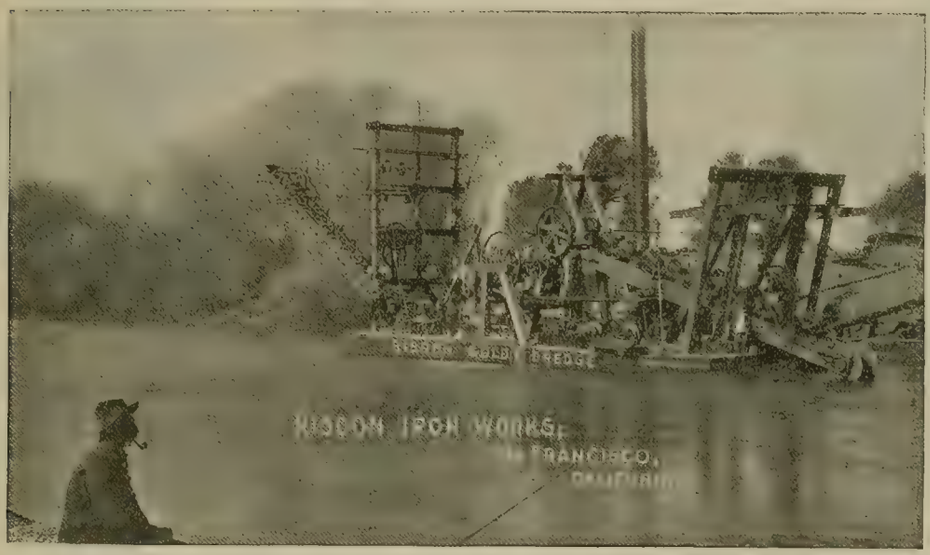
JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.



RISDON IRON WORKS,

Cable: "Risdon's." Code: A. B. C. & Leibers.

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines
OUR SPECIALTY.

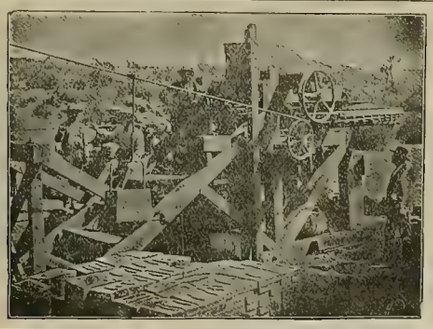
We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.
We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.
Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.
LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

A COMBINED POWER-SHOVEL AND CABLEWAY.
.....Ask for Circular.....

A New Logging Engine.

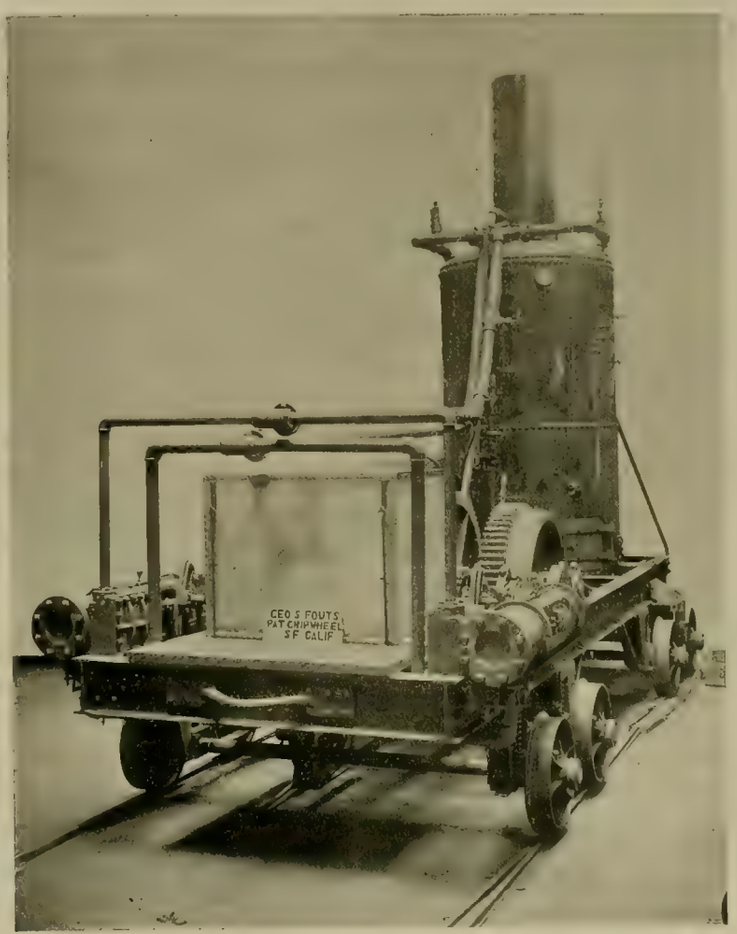
The latest designed machine for logging is the Fouts patent grip wheel for hauling logs or other heavy material where traction engines fail to do the work. What is claimed is a positive grippage of the cable without injury to it and without any slippage whatever. The accompanying cuts represent a logging locomotive for hauling on a skid road one and a half miles in length and very crooked.

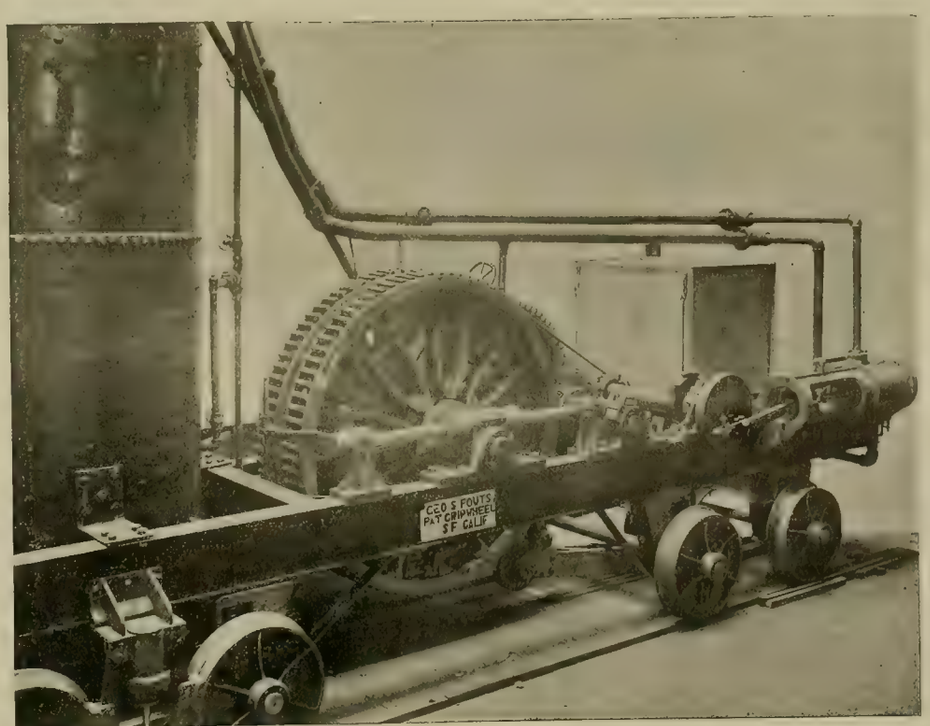
This machine is designed to run on T rails and to haul a train of logs which slides on the skids. There is a 1¼-inch crucible steel cable, one and a half miles long, which is anchored at each end, there being one turn taken around the grip wheel. The cable is first passed under a guide sheave, then over the governor sheave, once around the grip wheel and over the governor sheave, then under the guide sheave. These guide sheaves keep the cable always at the bottom of the rails and in rounding curves the cable is held in place by knees or fore masters.

The grippage of the cable is automatic—that is, the heavier the pull the tighter it grips, the lighter the pull the less it grips. There are eight grips in the wheel, of 10 inches each, six of which are on all the time and two are off. The two that are off are at the point where the cable enters and leaves the wheel. The grips are moved to and fro from a cam, which is held while the wheel turns with the grips. This cam is moved longitudinally on the shaft by a lever or arm which connects with the governor sheave over which the cable runs and the tightening cable pulls the sheaves down, and through the lever or arm pulls the cam out and increases the grippage in proportion to the strain on the cable.

The wheel is made of very hard iron and is chilled, like a car wheel, where the cable runs; the grips, sixteen in all, are made of chilled iron and easily replaced. The movement of the grips is at right angles to the cable; they are moved to and fro by the cam. The grips are made to fit the cable, and under heavy pressure tend to keep the cable round. They grip the cable after it has been placed in the wheel and release it before it is ready to leave the wheel—that is, automatically taking hold and letting go of the cable at the proper time.

The locomotive as shown has a 5-foot submerged tube boiler 10 feet high with 240 2-inch tubes, with 3 foot firebox, 4-foot tubes and 3-foot steam dome, and furnishes steam to a double 9x12-inch reversible engine under 150 pounds pressure.





GRIP WHEEL AND LOGGING ENGINE.

The gearing as shown is designed for two speeds, one at one and a half miles per hour and the other at three miles per hour. This machine will climb a 45% grade. What is claimed for these machines is that they will climb any grade, and that they will pull all the cable will stand without injury to the cable; that they will make a great saving in the grading of roads for their use over traction engines.

This machine was designed to run on a thirty-pound T rail with 8-foot gauge and with equalizer springs for running over an uneven track. The frame is made of 12-inch steel I beams and are well braced and riveted.

The machine was built to take the place of seven yoke of oxen which were hauling about 25,000 feet of logs per day a distance of one and a quarter miles, and it is estimated that it can deliver 200,000 feet per day with a haul of one and a half miles. It is now hauling logs at H. S. Colvin's logging camp, Marshland, Columbia Co., Oregon, about sixty miles below Portland on the Columbia river, and is hauling 15,000 feet of logs per trip, and from five to six trips a day.

The machinery is built for George S. Fouts by the Electrical Engineering Co., 509 Howard St., San Francisco, Cal., under their guarantee as to quality of work and material and satisfactory operation.

KANSAS CITY, Mo., is taking steps to secure the establishment of a mint in that city. They claim 27% of all the gold produced in the United States and adjacent territory is minted in San Francisco, Cal.; New Orleans 3%, and Philadelphia 70%. It is also stated that 50% of the gold is refined at Kansas City, Denver, Deadwood and Omaha, and at least a portion of this should be minted in the central section of the Union.

STATE Commissioner of Mines of Colorado Harry A. Lee has issued Bulletin No. 3 of the State Mining Bureau of Colorado, being a copy of the Act passed by the recent State Legislature creating the Bureau of Mines, and providing for the appointment of the State Commissioner of Mines, defining his duties and stating clearly the relation of mine owners and operators to the State.

STEEL gallows-frames and mine buildings with steel frames are coming into use quite prominently, and in a few years they will no doubt become common.

AS INDICATING the feeling of the public toward the Amalgamated Copper Co., it is stated that during the recent panic in New York, with securities of almost all kinds falling, the Amalgamated Co. remained firm and has since advanced somewhat.

THE newly discovered diamond fields about Pretoria, S. A. R., are being extended by the discovery of new claims in almost every direction. The total yield from this field during the first quarter of the year was 6000 carats. These mines may become important competitors with the Kimberly fields.

COLORADO smelting companies declare they have reduced smelting charges to the lowest possible figure and that further reductions are impossible. On concentrates, particularly, it is claimed they positively can go no lower. They have been seriously considering the employment of their men by the hour.

THE copper situation is practically unchanged. The price remains at 19 cents and stocks are quiet and dull. Manufacturers find the demand unchecked by the price and the immediate future seems promising. The visible supply gained slightly during the first two weeks of May, reported from London to be 628 tons.

THE usual fate of mining camps has visited Dawson City, Alaska. A fire recently destroyed the greater portion of the town. Jerome, Arizona, the town at the United Verde copper mine, was also destroyed last week by fire, being the second time within a few months. There are few mining towns which have not had a like fate. Leadville, Colo., is one of the most fortunate in this respect.

INCREASE in output of Western copper will probably soon make itself manifest in the Eastern market. The whole mining world is being stimulated to an increased output of the metal urged on by a price higher than has obtained in many years. The result may be to lower the price somewhat, and should this occur electricity will also take a new impetus and will probably absorb the production, whatever it may be. What the future has in store for copper one can only surmise. At present it looks promising for the miners.

DO GOLD nuggets grow? is a question that has been asked many times. Under certain circumstances they undoubtedly do. Several years ago a propspector picked up a nugget in a California gravel mine which weighed $600. Ever since that time this nugget has steadily grown until now when reference is made to the finding of the lump it is usually stated that it weighed $1600. In a few years it will probably have grown to $6000 and possibly in time it may reach $60,000. There is no real evidence to indicate that nuggets grow in any other manner than above described.

SOME miners in southern California are now having trouble over the use of water for the purpose of hydraulic mining. Some time since Judge Allen of Department 6 of the Superior Court of Los Angeles county enjoined Chas. Hagan from using the waters of the San Gabriel river for the purpose of hydraulic mining in the San Gabriel canyon; and recently Mr. Allen, disregarding the injunction of the court, resumed operations, for which he was fined $250. While the disobedience of an injunction of the court in any case is almost certain to bring punishment in the way of a fine for contempt, it would seem that a hearing in the case and, if necessary, an appeal from the decision of the court might have served the miner better, for the gold-bearing gravels are twenty miles up the canyon from the lands at its mouth, where the farmers claim to be damaged by the debris. The San Gabriel canyon has its mouth near the village of Azusa, and the large boulders strewn over hundreds of acres of the land near the mouth of the canyon is sufficient evidence of the torrential character of the stream. In summer and fall the bed of the canyon is almost dry and in spring it is often a raging torrent, carrying everything before it. How, under the existing conditions, hydraulic mining (which must necessarily be limited in its character) can possibly injure the farm lands of Azusa, Covina and Duarte is difficult to understand, particularly when it is considered that the lands of the two latter villages are a mile or more from the stream.

As a great many inquiries concerning the recent repeal of the State laws of California relative to the location and recording of claims continue to be received the bill is published below in full. It is known as Assembly Bill No. 140, and repealed the local mining laws of California, enacted March 27, 1897. It passed the Assembly March 3, 1899; passed the Senate March 15, 1899, and was signed by Governor Gage March 20, 1899, upon which it became a law and took effect at once. The full text of the bill is as follows:

An Act to repeal "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March 27, 1897.

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. An Act to repeal "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March twenty-seventh, eighteen hundred and ninety-seven, is hereby repealed.

SEC. 2. This Act shall take effect immediately.

Approved March 20, 1899.

THE production of pig iron in the United States has steadily increased until it is authoratatively stated the output now reaches 13,000,000 tons of pig metal annually, which is the largest production of iron ever made in the United States or any other country. The demand continues and a constantly rising price does not appear to diminish it. A question of great importance is, where is the supply for the future to be found? The "inexhaustible" beds in the Lake Superior region are rapidly proving that they are far from inexhaustible, so vast have been the inroads on these deposits. Even such enormous masses as those of the Lake Superior region are far from inexhaustible. An increased output is predicted for mid-summer, but this only means the quicker exhaustion of the mines. The demand is not only on the Lake Superior region, but also in the South and Missouri. If this condition lasts much longer it must eventually turn attention to the iron ore deposits of the West. There are large iron deposits in Utah, California and elsewhere, and though not at present commercially available they must soon become so. A few years hence will probably see iron ore valued as highly and as much sought after as copper now is. The fuel question, in the light of recent discoveries in electricity, seems much less important than that of the iron supply of the future.

CALIFORNIA each year is getting further from the old-time methods in mining, and the latest ideas in electricity, compressed air, metallurgy and mining methods are being adopted. The old-time ideas were good in the old time, but new methods must meet the constantly changing conditions. In newer mining communities they are not handicapped by the old-time ideas and methods, and, as a result, mines in some cases outside of California are leading this State in progressive work. California has in a measure been spoiled by the facility with which gold was obtained in the earlier days, when great fortunes were taken from the mines at comparatively little expense. That era to a great extent is past. The old mines are deep, and only the latest labor-saving devices and the best machinery of all classes should now be employed. The new mines are imitating the newly resurrected older ones and are getting the latest and best of everything. They realize that mining is a business and that the mines are deep, and, in order to derive the greatest benefit and to work to the best advantage, old-time ideas must give place to the new.

STORIES of the fabulous richness of the newly discovered placers in Lower California are beginning to find their way into the daily papers. The mines are reported to exist over a tract of country twenty miles square. There is absolutely no water, no means of obtaining supplies within several hundred miles and the chances are that the Mexicans in whose country these gold deposits are found will secure the best of the ground and, no doubt, have already done so. Still the rush has commenced and it may assume large proportions, dependent somewhat upon the continued success of those now in the field. Reports of large and fabulously rich ledges, mother lodes and other like fanciful deposits of gold galore, may now be looked for from the same source.

IT is doubtless a good, safe plan to permit your neighbor to do the experimenting, but a misplaced conservatism is quite as bad as a foolish practice of undertaking to adopt every new idea which is promulgated. Some one must do the experimenting or the world would practically come to a standstill. Well-planned experiment, based on the lines of common sense, is very often productive of great good, and experiment of this kind deserves to be encouraged. Old methods are often good, but as often new methods are much better. In the mining business new ideas are valuable, and great advancement has been made in several branches of the industry within recent years.

WHEN a notice is read in a newspaper stating that a new corporation has been formed for the purpose of operating a certain mine or mines, generally with a capital stock of a million or two with but $50 subscribed, it does not signify that the company is without funds and that sufficient money is not available for the purpose for which the company was organized and incorporated. They have simply complied with the requirements of the law which demands that the directors shall hold at least five shares each of the capital stock of the company. Many corporate companies take advantage of this to keep their business affairs secret.

ALL of the large and successful mining enterprises in the country were small concerns in the beginning of their history. A mine must be made, and it requires usually a vast amount of money, much time and planning to bring about the desired result; but no amount of money or scheming will make a mine where the values do not exist in the ground. Some great mines require much less money and less time than others to achieve greatness, and in some instances the promoters of mining schemes attempt to "thrust greatness upon" the mines they are endeavoring to sell.

Concentrates.

AN alternating current is one which rapidly changes its direction.

ON the earth's surface 52,000,000 square miles are land and 196,000,000 square miles are water.

HORN SILVER and silver chloride are synonymous. The technical or chemical name is cerargyrite.

AN anode is the positive terminal of an electric source, the cathode being the negative terminal.

AN accumulator is an apparatus employed for storing electrical energy, produced by another apparatus.

HIGH pressure steam is over fifteen pounds to the square inch; under fifteen pounds it is called low pressure.

W. S. STRATTON, who recently sold the Independence mine at Cripple Creek for $10,000,000, discovered the mine in 1891.

GOLD-BEARING gravel deposits occur in New Mexico along the valley of the Rio Grande which are from 50 to over 600 feet deep.

UNDERCURRENTS in sluices are for the purpose of relieving the sluices of the finer material, thereby aiding in saving the gold.

A GREASY piece of machinery may be quickly and perfectly cleaned by means of steam, directed by a hose attached to the boiler.

THERE is no formula which has been generally accepted for determining the velocity of water in open channels like a ditch or flume.

THE quantity of water fed to the battery must be determined by the character of the ore and the freedom with which it amalgamates.

THE best water to use in a boiler is rain water. All waters containing mineral in solution will deposit scale in greater or less quantity.

BOLIVIA is credited with having produced more than $200,000,000 in gold. New Grenada is said to have produced more than $800,000,000 in gold.

ALDER GULCH, in Montana, is said to have produced in three years $30,000,000. The total output of the gulch is placed by some as high as $70,000,000.

THE placer mines of the Black Hills, South Dakota, were mostly gulch mines. Hydraulic operations were carried on in a number of places, but on a limited scale.

A PARTIAL ECLIPSE of the sun occurs June 8, visible in Alaska near sunset. A total eclipse of the moon will occur June 23, visible in the Pacific about Honolulu.

IT is claimed Mexicans washed gold from the placer mines in western Los Angeles county, Cal., many years before gold was found at Sutter's Fort, in El Dorado county, Cal.

A FLUME is preferable to a ditch where the rock is either very hard or soft and crumbling. Where the absorption and evaporation are great, flumes should be built in preference to ditches.

RUSTY steel may be cleaned by a mixture made of tin putty, 10 parts; prepared bucks horn, 8 parts; spirits of wine, 25 parts. Mix to a paste, apply and rub off with a piece of blotting paper.

THERE appears to be no falling off in the value of the banket in the Witwatersrand, in great depth. A late interesting discovery is that of a sandstone stratum containing gold in paying quantity.

ONE of the largest if not absolutely the largest gold ore body in the United States is that in the Homestake mine, South Dakota, which on the 800-foot level is said to be 450 feet wide, all pay ore.

THE fact that a shaft has been sunk 425 feet through gold bearing gravel without reaching bedrock need not deter the owners from sinking still deeper as bedrock must lie at some point below.

OPAL is a variety of quartz in which the silica appears to have a different molecular arrangement. The hardness and specific gravity are less than ordinary quartz. It is soluble in a hot alkaline solution.

THE quantity of iron or steel worn away in mortars of quartz mills varies greatly with the varying conditions, but particularly with the hardness of the quartz. Some ores wear away much more than others.

DIAMONDS have been found in a number of localities in the United States—in California, North Carolina, Georgia, Virginia, Colorado, Wisconsin, Oregon, and, it is reported, also in Idaho, Arizona and Montana.

IN the Black Hills of South Dakota, coarse gold has been found lying on the surface of the ground 3 to 4 feet above bedrock. This was not of infrequent occurrence in the region of Castle Creek in Pennington county.

UNDER favorable circumstances stamps with a low drop may be dropped 110 per minute. There is danger at this speed of camming, that is, the tappet striking the cam. Ninety-five drops is the average speed of stamps in California mills.

NO PERSON is permitted to cut timber on the public lands of the United States for sale to others. The smallest tract of timber or agricultural land which may be filed upon is forty acres. Timber land is paid for at the rate of $2.50 per acre.

WHEN a curve occurs in a flume line, the outer side of the curve is raised somewhat in order to prevent irregular currents and splashing. Where the flume runs through a cold country this is particularly necessary, as splashing often results in the formation of ice.

THE methods for determining amount of sulphur in carbonate or other ores and substances as employed by assayers and smelting works will be found in a manual of practical assaying by Furman, and also in Fresenius system of instruction in qualitative chemical analysis.

DRY WASHING was carried on in California at first by the Mexicans and Indians and later taken up by the Americans, who substituted machines for the slower primitive method of tossing the dirt up in a blanket or pan in a current of wind. A large amount of gold has been obtained in this manner.

WHEN planning a canvas plant and chlorination or cyanide works, place the canvas plant nearest the mill and the cyanide or chlorination plant below it, arranging, where possible, so that all the pulp passes from one operation to the next by gravity, as far as possible avoiding pumping.

AS the work advances in the face of a hydraulic claim, avoid cutting in the shape of a horseshoe. When this is done the workmen soon find themselves surrounded on three sides by high banks and can no longer work to advantage. The face should be kept square across the stream.

UNDER native management the gravel mines of Chili are reported to have produced an annual average of $600,000. Americans attempted to work the mines, but without success, the yield being too small and the quantity of water scarce. The natives evidently were satisfied with small returns.

LIGHTLY cemented gravel can often be disintegrated by charging in a large arrastra run by water or steam power, where the drags will break up the material so that it may be washed readily. These arrastras should have open discharges, and, when properly arranged, should disintegrate fifty tons daily.

THE specimens of pink rubellite occuring in lepidolite in radiated crystals, found in California, are from Riverside county, near Pala Mission. Rubellite and other varieties of tourmaline, other than black, occur at Mesa Grande, San Diego county, and near Strawberry valley, in the San Jacinto mountains, in Riverside county.

IN southern California are gravel and sandy deposits of great thickness which near the surface are gold bearing. The gold occurs in a semi-cement, consisting of gravel, sand, cobbles and clay. The gold is fine and none of the deposits are rich. The deposits near Newhall in Los Angeles county are of this character.

BLACK SAND which assays in gold but contains no free gold which may be amalgamated should be sent to a smelter, if the assay shows it to contain sufficient gold to pay cost of collecting, transportation and treatment and a profit besides. Some recent shipments of this character of material are said to have yielded very satisfactory returns.

THE atmosphere in the deserts of California and in Arizona and the great basin is remarkable for its clearness when no sand storms are blowing. From Stockton hill, Arizona, Snow peak in the State of Nevada may be seen clearly—a distance of 175 miles. A more distant object could be seen as readily, as under favorable conditions there is no haze at all.

GROUND SLUICING is the term applied to the method of mining gravel by means of pick, shovel and bars, the gravel being washed in trenches cut in the bedrock. A stream of water is often brought to the top of the bank which is being caved down and assists in carrying away the debris. The material cleaned up from the bedrock in the trenches is usually washed in rockers or short sluices.

THE method of timbering mines by means of square sets was first introduced in the Ophir mine of the Comstock lode at Virginia City, Nevada, whence it came to be known as the Nevada square set. The inventor was Ph. Deidesheimer. The history and method of framing and constructing square sets is fully set forth in Bulletin No. 2 of the California State Mining Bureau—"Methods of Mine Timbering."

WHEN laying the floor of a canvas plant, dry, well-seasoned lumber should be used. Planed 4-inch boards make a good floor. They should be laid ¼ inch apart; the subsequent swelling, due to water passing over the floor, causes them to close tightly in a few days. If laid too close, the floor will "buckle up" and make an uneven surface, which would completely destroy the usefulness of the plant.

IT is claimed that there is more efficiency in a single heavy stream—2000 to 3000 inches under a high head—than can be obtained from the same amount of water under like head divided into two streams when directed against a gravel bank. The proper method of using two streams at a hydraulic mine is to use one stream to cut the bank down and the other to wash the loosened gravel into the sluices.

TOUCHSTONE, also called Lydian stone and basanite, is a variety of jasper (silica), is velvety-black in color, and, owing to its hardness and color, is often used for the purpose of testing the purity of precious metals. This is done by making a streak of the metal on the stone by rubbing. Experts can judge closely the fineness of gold by this means. Sometimes the streak is compared with that made by alloys of known fineness.

ONE reason why gold is seldom found in pot holes in auriferous streams is probably due to the fact that swift currents plunging into the depression sweep the golden particles out, redepositing them at a point lower down the stream. Another reason is that those pieces or grains that are not swept out in this manner are ground among the rocks and sand which are constantly scouring in these pot holes and are in consequence actually worn out by attrition.

WHEN selecting a site for a tunnel to develop or work a mine, do not go so low that the ore cannot be run from the tunnel directly into a mill on the breaker floor, from which the ore would descend by gravity through the various processes until it passes out of the mill. If there is a heavy fall in the canyon or gulch below the proposed tunnel site, the tunnel may be started lower and the mill may be built some distance down the gulch, in order that the ore may be trammed into the top of the mill.

BEFORE determining upon a site for building a mill the relation of the site to the mine should be carefully studied, not only for the present need but for the probable future requirement of the mine. A mill badly located is always thereafter a source of trouble and expense. Where convenient, select a site where the several floors may be graded out and cut to bedrock. Never leave a high face on a cut in the rear of a mill without building a retaining wall in front of it, unless the face be solid rock, which will not cave.

A GLASS water gauge may be cut with a new file. Wet the file and run it two or three times around the place where it is desired to cut the glass. Then grasp the tube firmly with the thumbs about an inch apart and at equal distances from the file cut, bend the tube and if the cuts have been properly made it will break where desired. Another method is to tie a cotton twine around the glass at the point it should be cut off. Saturate the string in coal oil or alcohol and light it. After it has burned a minute plunge into cold water and the tube will snap off where the string was tied.

IT is said that the women of Honduras washed gold from the sands of the Guayape river and from the proceeds of their labor paid for the construction of a church at the town of Juticalpa. The gold was gotten by washing the auriferous sands in bateas. They seldom took gravel from bedrock and often waded into the stream, dipping up the gravel and sand from under the water and dexterously separating the gold from the wash. A large number of women engaged in the work, which was continued over a period of years before sufficient gold was obtained for the purpose.

SCHEELITE is calcium tungstate of pale yellowish, brownish, reddish or greenish shades, sometimes white. It is from transparent to translucent. Its hardness is 4.5 to 5, about the same as apatite. Its high specific gravity is a notable characteristic, being from 5.9 to 6.1—considerably above that of baryta (heavy spar), which is about 4.3 to 4.5. It is the heaviest mineral which is transparent and glassy, excepting lead compounds, such as cerussite and anglesite. It is sometimes found associated with wolframite, an iron-manganese tungstate, in granitic and other crystalline rocks.

THE extremely fine slimes floating on the surface of the wash boxes of vanners and elsewhere about mills may usually be settled by allowing the current carrying the floating material to pass through a piece of pipe, the lower end of which is bent downward, and discharging under water. The greater portion of the slimes will remain under the surface and settle to the bottom. All current must be avoided as far as possible. When this floating mineral passes from one box to another through a pipe or otherwise, and is allowed to discharge even a short distance above the surface of the water below, the material rises to the surface and floats as before.

RUBY SILVER is of two kinds, antimonial and arsenical. Pyrargyrite is dark red silver ore, occurring in crystals and also massive and compact, brittle and soft, luster adamantine metallic, color black to grayish black, streak purplish red; sulphur 17.8, antimony 22.3, silver 59.9. Proustite is light red silver ore, which also occurs in crystals and massive to compact; color scarlet vermilion; sulphur 19.4, arsenic 15.2, silver 65.4. Polybasite is also an antimonial silver ore containing sulphur 15, antimony 9.4, and silver 75.6. Sometimes part of the silver is replaced by copper and the antimony by arsenic. The color of this ore is iron black, luster metallic.

ONYX is a name applied to a kind of agate arranged in bands. The colors are usually clear brown and white. The so-called Mexican and Arizona onyx is almost pure carbonate of lime, the variety known as aragonite containing a low percentage of silica. The colors are due to iron oxides. These rocks have resulted from a long-continued deposition of calcium carbonate from calcareous springs. The Big Bug, Ariz., deposit covers about eighty-five acres in a tract of 200 acres, and varies from 1 foot to 50 feet in thickness. Aragonite occurs in California at a number of places—in San Luis Obispo, Solano and San Bernardino counties, and also in Inyo and elsewhere.

ANY person locating a mining claim in California after the repeal of the local (State) laws by the recent State Legislature relating to the location and recording of mines, by which the locator now acts under the federal statutes, and who has fully complied with the requirements of the former State laws, need have no fear of the validity of his location for the reason that the State law required more of the locator than was required by the federal law and the State law was at no time in conflict with the federal law. Necessarily the locator, who, unaware of the repeal of the law of March, '97, locates his claim in accordance with that law must be within the requirements of the United States law.

LOWER CALIFORNIA was discovered in 1534 by an expedition sent out by Cortez. It is a hot arid region in which there are few living streams. There are here and there fertile spots in the valleys, and should sufficient water be obtained for irrigation many places would become fertile. The gold mines occur throughout the length of the peninsula, beginning at the international boundary. It is not unlikely that the discovery of placer fields at Santa Clara, called by the Mexicans Cerro Pinto or Painted Hill, may lead to the discovery of other fields in the vicinity. Some of the mountain ranges in the interior rise to a height of 11,000 feet or more, one of the principal mountains being San Pedro de Martin.

WHEN a mining claim is located it is subject to any prior rights which may exist—as a claim which is crossed by a ditch which existed before the claim was located. In this case the ditch may be maintained. In the event, however, of failure to cause the water to flow through the ditch, or to use the water for a period of years, it might be looked upon as an abandonment; but how the court would construe this cannot be anticipated. Their act in cleaning out the ditch every two years may hold their claim to the water. There are, in cases of this kind, many things which only appear when the case has reached the courts. There are no features of the mining law more perplexing than those relating to water. This case would probably have to be tested in the courts.

SWELLING GROUND can not be held in place by timbers. In drifts heavy posts should be placed having a wide spread at the foot, and heavy caps should be provided. Lagging 2½x8 inches is heavy enough, and these should be driven at the sides not closer than 10 inches. The ground will press through the open space and can be cut out, relieving the pressure temporarily, but later the same thing must be done again. The lagging will bend considerably before it will break, thus giving indication of the increasing pressure. The ground should be relieved at once, whether it is working through the spaces between the lagging or not. The foot of the post should not be spragged across the drift, for it will result in the crushing of the sprag and also probably the breaking of the post. If the foot of the post is crowded in by the shifting ground, set up false sets on either side; if necessary, cut out the ground back of the post and replace it in its former position.

Some Characteristic Mines of the California Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS.

The most important mine thus far opened on the east lode of the gold belt in Mariposa county is the Hite mine at Hite's cove, on the south fork of the Merced river. The mountains are very steep and rise from 2000 to 4000 feet above the river. The hills are densely clad with chaparral and greasewood and the higher ridges and slopes support a growth of yellow pine and a few oaks. There is but one road into the region, that from the direction of Mariposa, made at great expense. The rock formations exposed in the vicinity are those characteristic of the Calaveras formation, consisting of clay slates, mica schist, quartzite, crystalline limestone and more or less silicious beds of slaty structure. These rocks are greatly folded, shattered and crushed, and indurated by pressure and intruded by dykes of diorite, granite and felsitic rocks.

The Hite vein strikes N. 70 W. and dips northeasterly at about 75° in the clay slates. It maintains a remarkably straight course for a long distance, but is accompanied by numerous branches, mostly into the hanging wall side. The slates are foliated, metallic and lustrous, usually soft and often crushed to a gouge-like condition. Rock of this character is very heavy and necessitates frequent repairs to timbering. Whenever this rock presents a smooth, perfect slaty cleavage it is always at a distance from the fissure. The latter condition gradually changes to that of the foliated mass above described upon nearing the crevice, whether it be ore-bearing or not. One remarkable phenomenon connected with the Hite vein is the splitting off of a large vein which makes out into the foot wall side in a sweeping curve and returning to the main fissure again in a distance of about 600 feet from the point of departure. In depth it also reunites with the main vein at a depth of about 600 feet. The enclosed mass of slate has the form of a large plano-convex lense, having a diameter of 600 feet and a thickness at the center of 45 to 50 feet. The segment of slate is enclosed between two veins of quartz, each of which is gold-bearing, and, as the results of operations showed, was rich in gold. The surface croppings of milk-white quartz a few inches to 12 feet in width were studded with dull yellow gold, and from the day of its discovery the owner was practically a rich man, for, though almost penniless at the time, he soon had pounded out in a hand mortar enough gold from the rich quartz to supply every necessity and later to build a mill. The vein has since produced nearly $2,500,000.

The fissures have been extensively developed to a depth of 900 feet below the croppings through crosscut tunnels, the lower of which reaches the vein at a depth of 600 feet, and is nearly 1400 feet long, driven through hard slate of the foot wall country. A large dyke of felsitic rock accompanies the vein, lying in the hanging wall, and is usually in contact with the vein. In the lower workings the vein varies from 4 to 25 feet in width, the latter obtaining at the union of the hanging wall vein with the branch split off in the foot.

The quartz commonly includes more or less slaty material, a feature common to veins in slate rock everywhere. A banded appearance of the quartz, probably induced, in part at least, by the original slaty structure of the rock which has been replaced by silica, is very noticeable and persistent throughout the mine. This banded or ribbon structure may possibly have been intensified by pressure. The physical appearance of the quartz is not always a safe index of its value, for two pieces of rock may be alike to all appearances and still differ greatly in value. The mine has not had any development worthy of mention in the hanging wall side, but there are abundant indications that good shoots of quartz may be found there. It is a mine well suited to prospecting from the old workings by means of the diamond drill.

The mine has been idle for some time and is presumed to be worked out. The fissure is still strong, with all the physical conditions which characterized it at the higher levels, and it is only reasonable to anticipate a repetition of these ore shoots at greater depth. Should they not occur in the same fissure, they may be found to have lapped, as is frequently the case.

Another important mine in this county which also occurs in black slate is the Princeton, on the Mariposa estate, at Princeton. It was worked in the '60s and is reported to have produced more than $4,000,000 to a depth of 600 feet. Little at this time is known of the old mine workings other than that the gold was derived from a single large shoot presumed to be worked out. The last operations conducted at that mine were not creditable to the management, as the workings and shafts were filled up with waste rock in the process of gutting the mine, and there is no probability that it will ever be reopened through the old openings. A dyke of light gray felsitic rock also accompanies the Princeton vein, lying in the hanging wall side and often in contact with the vein. The longitudinal continuity of the vein has never been satisfactorily established beyond the workings—at least no pay rock in quantity found on an extension of the vein.

On the foot wall side for a width of several hundred feet there are a number of gold-bearing veins which possibly belong to the Princeton system. Should the mine ever be reopened it will probably be by means of a vertical shaft sunk in the hanging wall at such a distance that the vertical will strike the vein at great depth and far below the deepest old workings. W. H. S.

Mining Towns of the Lake Superior Copper Region.

The copper country of Michigan never knew the meaning of hard times. Year after year there is plenty of work, profitable work, too, both to the miner and the stockholder. Practically isolated from the rest of the world, the people are about 100 years behind the times. They have no push, none of the ambition which characterizes the average American. They are a contented lot, and in their isolation they feel secure from hard times, panics, etc. Most of the miners are Cornishmen, who have not been affected by the American way of doing things. When once assured a position in the mines, the Cornishman has no more worry about work, for on the average the miners work all their lives in the same shaft, at the same work and on about the same pay.

There are few places where the effects and consequences of paternalism are better manifested. The mining companies, to all intents and purposes, adopt the miners; the company's physicians look after the physical welfare of the men; the miners must buy their goods at the company's store; indeed, the company takes charge of the employe in all the various relations of life. And the miner is contented, too. Very seldom is there any trouble, and all the difficulties are readily adjusted.

There are no cities in the copper country—the companies do not care to pay the cost of maintaining city governments. All the mining centers are governed under village charters; all such institutions as water works, electric light plants, etc., are built by the mining companies; they build the churches, the schools, the library buildings; in short, the destiny of the miner is entirely in the hands of the mining company. The employe, whether Cornish or Italian, realizes this and works accordingly.

The Calumet & Hecla Company is a great mining company, whether judged from the standpoint of machinery used or dividends declared. Since the mine was first operated in '71, under its present name, over $60,000,000 has been paid in dividends, and there is now over $7,000,000 in cash in the treasury. The company owns its water plant, its smelting plant, practically the whole village of Calumet, its coal docks, railroads, twenty-six churches, as many schools, hospitals, and the village officials—for no one can obtain such a position without the approval of the company's agent.

The stock of this company once sold at $3 to $4; last February it sold at the enormous sum of $890 per share. In Calumet there is a drayman named Peter Kaus, who owns 700 shares of the stock; all the dividend money is immediately invested in shares of the stock as fast as he receives it, and he takes great pleasure in carrying a satchel for 25 cents. In fact, he lives from the proceeds of his business as drayman, notwithstanding that he is worth three-quarters of a million. Up to the present time this company has produced 1,260,000,000 pounds of refined copper.

The stamp mills on the shore of Torch lake crush 2,000,000 tons of ore yearly, and the pumping capacity of the plant is up in the hundreds of millions daily.

The mineral vein on this property is 35 feet wide and its depth is yet a matter of conjecture. One shaft has been sunk to a depth of over a mile, and the ore still continues. It is stated that nothing but a high temperature consequent to a great depth would ever stop work in the mine. The engine driving the cable to the shafts on this property has a horse-power of 35,000, is built in duplicate, and was designed and built by the Krupp Company, Germany. The cars are drawn and lowered the whole length of the deepest shafts in about two and one-half minutes, and the sensation of a person taking a ride in one of the cars is indescribable. You seem to be falling right through the earth and the time seems to be hours.

REPORTS of mining engineers and copper experts familiar with recent developments of the copper regions of Arizona say there is no doubt that that Territory will speedily become one of the chief mineral producing regions of the country, the main mining interests being in the production of copper. There is great activity in all branches of mining throughout the Territory, and parties are constantly coming in, looking for investment. The mines are generally from 4000 to 5000 feet altitude.—Iron and Steel.

Some Experiences of a Working Miner.

NUMBER XVII.

Written for the MINING AND SCIENTIFIC PRESS.

One day C—— and R—— came trudging down the steep mountain side near C—— and one of them picked up a nugget weighing nearly $2. They looked about on the ground for half an hour, but found no more and continued on down the mountain to their cabin near the mouth of the gulch. During dinner they talked of the finding of the nugget and concluded there must be more where that came from. They felt sure they would be able to take out considerable gold at little cost if they had sluice boxes; but they had no sluice boxes, and none could be obtained nearer than six miles. They determined to bring the necessary boxes and accordingly the following morning they started out with two pack animals and finally brought over three lengths of sluice box which they had used at another mine. They spent three more days in building a dam in C—— creek and another day and a half in cutting a roadway up to the place where the nugget was found. At the end of a week's hard work they were ready to mine and started in early Monday morning. They picked dirt half a day and at noon cleaned up, and got just one 10-cent color. Now, all this work might have been saved them if they had done a little preliminary prospecting.

When R—— staked M—— at the B—— mine he thought he would make a fortune. For a month or two reports from the B—— mine were favorable and R—— was elated. Then a week passed and no report. A little later he heard a rumor that the B—— mine had pinched out, and later news convinced him that this was so. The next step was to try and sell out before any one learned of the failure. R—— hunted up H—— and after deftly leading up to the point said that he wanted to go East again, being tired of living in the wilderness. He was getting old and should have rest and ought to live in a place where he could go to church, etc. He then asked H—— to bid on a half interest in the B—— mine, and H—— offered a small sum, which R—— accepted with apparently great reluctance, but with secret pleasure. A few days later H—— heard of the misfortune that had overtaken the B—— mine, and meeting R—— asked him about it. In reply R—— promptly offered him the remaining half interest, which, to his surprise, H—— took, at a still lower figure than had been paid for the first half. Two days later G—— came into camp from D—— and inquired for R——. He stated his business and offered a good round sum for the B—— mine, not knowing R—— had sold it. R—— made every effort to buy the mine back from H——, offering all kinds of prices below the handsome offer of G——, but H—— expressed himself satisfied and would not sell. It is not always safe to believe all one hears of the development of a mine, whether favorable or not.

In the same camp was another prospector who had a claim, which he held very high. He worked in a dry gulch placer to obtain the necessary funds to work the quartz mine. Eventually he worked out the placer and, having no surplus, made an effort to sell the quartz mine at a high figure. As he was unsuccessful he continued his effort, lowering the price from time to time, until he offered the once valued claim for a grubstake. Two young men came along about this time and made an examination of the vein, did some prospecting and took away with them a quantity of the ore. Two weeks later they returned and after some preliminary talk offered $6000 for the claim. The owner became at once indignant and refused to sell at any price. As far as I ever heard he never had another opportunity to sell.

The term "apex" is a simple one physically. It means the top or summit of an object, as a cone, a pyramid or hill. Legally it is the term applied to the "croppings" of a mineral vein or deposit; that is, that portion nearest the surface of the earth whether actually being exposed along the surface or lying beneath it and covered with soil, gravel, rocks, water or anything else. The term, however, is not as generally understood as might be supposed.

During the progress of the great D—— vs. D—— case, one of the lawyers connected with the trial called Mr. W——, a practical miner and a man who had seen considerable of the mining world. The attorney, during the course of his examination of Mr. W——, evidently realizing that the term "apex," which had become so familiar in the case was not fully understood, wished the jury to have this fact thoroughly impressed on their minds.

"Now, Mr. W——," said the attorney, "will you kindly explain to the court and the jury the common acceptance of the meaning of the term "apex" among miners and prospectors generally?"

Mr. W—— looked thoughtful for a moment and then said: "I have been about among the mines of the Rocky mountains and Pacific coast a good deal, and, of course, know a great many intelligent miners and prospectors; but really I don't think more than one in twenty of them would know an apex if he should find one lying dead in the road."

These instances serve to show that mineralogical

and legal terms in mining are not always thoroughly understood or interpreted.

When the K—— Mining Company built their pan mill they concluded to build an ore chute and thus obviate the necessity of packing ore down the steep mountain trail. The chute was built of wood, 2 feet wide and 18 inches deep. It extended from the lower dump to an ore bin directly back of the mill. When the first carload of ore was dumped into the head of the chute there came a roar and a rattle as a ton of ore rushed 500 feet down the steep slope. When the ore bin was reached large chunks of ore knocked the gate out and half a dozen boulders of rich chloride ore went through the roof of the mill, narrowly missing the man on the breaker floor. After repairing the damage the pack train was brought into use again.

When B—— was superintendent of the S—— mine he went up into the open cut one evening and directed the men to drill several deep holes and one short one—about a foot—and leave it. They did as they were directed, but naturally had a curiosity to know what was to be done with the shallow hole. The following morning B—— went to the cut and sent the men at work there to a distant part of the mine, underground. He then got the stable man and proceeded to get drill and hammer and go to work. The stable man took the drill and ran it down into the hole while B—— grasped the double-handed hammer firmly with both hands, gave a tremendous swing and missed the drill, plunging forward and falling over the stable man, who assisted him to his feet. "Catch hold of the drill, Ben," said B. But Ben, for some reason, seemed to lack confidence in B——'s ability to hit the steel bar, and so expressed himself. "Boss," said Ben, "you hit too hard; take it easy at the start and work up to it." So B—— started in easy and made better headway. Between each blow of the hammer Ben would timidly reach forward and give the drill a turn, and then hastily pull away as he saw the hammer descending. After awhile this pastime became work, and B—— put on his coat and he and Ben went down to the office, and the miners silently drew back into the dark recesses of the mine and when B—— was out of hearing groans and suppressed yells of merriment reverberated through the dark galleries. MINER.

Increasing Trade With China.

Exports of merchandise from the United States to China in the fiscal year about to end will be larger than those of any preceding year in our history. A decade ago the exports to China were less than $3,000,000, and to China and Hongkong combined were little over $6,000,000. In the fiscal year 1899 our exports to China will be more than $13,000,000, and to Hongkong more than $6,000,000, making a total to China and Hongkong of over $20,000,000, or more than three times as much as that of a decade earlier. That the bulk of the exports to Hongkong may properly be considered as ultimately destined for consumption in China is shown by the fact that the official reports of the imports into China show that over 44% of their imports are from the port of Hongkong. The 1899 exports to China and Hongkong combined will show a gain of nearly 25% over those of last year, while the total exports from the United States for the fiscal year 1899 will be little if any in excess of those of last year, thus showing a more rapid growth in our exports to this particular part of the world than elsewhere.

Among the things which will form an important addition to our exports to China in the future will be mining and milling machinery of every description. Already American mills and machinery are finding their way into that land, and the outlook for the coming year is more than promising in that direction.

The Great Lead Mines of Missouri.

In St. Francis county, Mo., within an area of nine miles square, are located the largest lead mines in the world. The ore in St. Francis county occurs disseminated in the lowest of the magnesian limestone series, particularly in that stratum which immediately overlies the sandstone. Beneath that is found granite and porphyry. This formation occurs in a general course from northeast to southwest. Ore chambers have been found two miles long, the vein varying in thickness of from 10 to 100 feet, from 30 to 50 feet thickness is by no means an exaggerated average. The average rock now being mined throughout the district contains from 8% to 15% of metal—although as high as 40% has been found. The mines require no timbers except around the top of the shaft. In large ore bodies pillars of ore, with smaller rock pillars, are left standing. There are two kinds of deposits, one in the vicinity of faults, and the other at a distance from the faults. The rock near to the breaks is more slab-like, and contains heavy ore, but the general dissemination is smaller. More care has to be exercised in the extraction of this ore to prevent caving of the walls. In the other case the ore occurs disseminated in the massive lime. Here roof and pillars stand as firm as the best constructed bridges.

The Rise in Zinc Due to More Extended Use of Electricity.

With the advent of the horseless carriage and other improvements to which electricity is applied, has come prosperity to the miner who delves into the earth to get out the rusty-looking stuff, which, after being crushed, is put upon the market as zinc ore.

Several important features have added to the prosperity of the zinc miner. One is the great strike in Belgium, which closed the zinc smelters of Europe and increased the American zinc export, and the other is the increased use of galvanized iron in this country. From $26 a ton the price of ore has jumped to $55 within a year, and this is said to be due to the exhaustion of important zinc mines in Belgium, the strike of the coal miners, the increased consumption of brass, which is made of copper and zinc; the expansion of the electric field, which relies largely upon zinc; the increase in the gold output and the development of the cyanide process of gold extraction, in which zinc plays an important part.

Zinc mining has an advantage as a rule over mining for other metals, for the reason that most of the mining is through ordinary earth and by means of shafts sunk to a depth varying from 25 to 100 feet. Not infrequently there is a layer of limestone to drill through, but the bane of the zinc miner is the water. Large pumping plants are necessary, and as a consequence it costs considerable money to get out the ore.

One thing is peculiar to zinc, and that is there is no such article on the market as scrap zinc. This metal is eaten up or vaporized and probably is more thoroughly consumed than any other metal. Thus, whatever goes into the market for use never again appears to be worked over, as is often the case with other metals.

The demand for zinc has tripled the last few years. There is more galvanized iron used now than ever before, and this, with the increased use of brass and the expansion of the electrical field and the development of the process for the treatment of gold ores, has naturally increased the demand for zinc in America; but added to this is the great foreign demand, and as a result the price has gone up rapidly. It is estimated that in the production of $40,000 in gold by the cyanide process two tons of zinc are consumed. It is said that South Africa alone uses over 400 tons of zinc in the extraction of gold through this process.

Zinc ore has been going upward in price with bounds that have surprised even the oldest and most sanguine miner. From a price that would hardly permit of its being mined at a profit three years ago it has gradually climbed upward until within a year, when it received an impetus from the great coal strike in Belgium, which virtually closed down the zinc smelters.

In '74 zinc sold for $10 a ton, and the total amount sold in the new zinc fields which were discovered in southwest Missouri and northern Arkansas that year amounted to less than 5100 tons, while ten years later the output for this district was 114,300 tons and the price had jumped to $18. In '94 zinc ore had reached $22 a ton, but not until it had fallen as low as $5 during the panicky times of '92 and '93. At one time in '92 zinc sold to the smelters at $27 a ton, and it went even higher at times when the weather was unfavorable to mining. But when the financial depression was affecting the business world zinc suffered a severe slump, from which it took years to recover, and even as late as '95 and '96 it had scarcely reached the point attained before the slump.

The production increased, however, and in '94 301,455 tons of ore were put on the market. Four years later the output had grown to more than double this amount, but the price of ore had dropped to $21.50. While this does not represent the entire zinc output of the country, it does represent the principal district, and the early years show almost the entire output.

In the electrical field zinc is only a negative metal, and yet no substitute has been found for it. The smelting process is expensive, as it usually requires three tons of coal to smelt it. This is done by vaporizing the ore and then condensing it, and there are few ores as volatile. The world's production of zinc is estimated at about 400,000 tons of ore, of which this country produces 265,000 tons each year. The output last year was 235,000 tons, which was an increase of more than 50,000 tons over the previous year. It is estimated that three-fourths of the zinc ore comes from the Missouri-Kansas-Arkansas fields, where the ore runs about 50% metallic zinc. Shrewd zinc buyers estimate the production this year at 270,000,000 pounds, which is the amount of copper produced by the American mines a few years ago.

It is an interesting fact that America controls the markets of the world in the two metals used in the electric field. Copper is the positive metal and zinc the negative. A few years ago this country exported no zinc in ore, but in recent years matters have changed. In '95 the exports of zinc ore reached 48,000 pounds, while 3,060,805 pounds went out in form of pig metal. This has gradually changed, until last year the reports show 21,040,000 pounds of zinc ore exported to 20,998,413 pounds of pig metal.

A prominent smelter says of zinc: "I believe the rise in zinc is due chiefly to the great strike in Europe, the increased use of galvanized iron and the development of the gold-extraction process. I do not believe the ore will go much higher, but you cannot tell. It is about $55 a ton now, and less than a year ago it was only $26, so you see how rapidly it has gone up. The mines in southwestern Missouri are being worked to the limit, and new fields are being opened in adjacent territory."

Transporting Power of the Wind.

Written for the MINING AND SCIENTIFIC PRESS.

There are few people, aside from geologists, who realize the transporting power of the wind in the geological sense. This ability of the wind to shape the topography of the earth's surface is known as Æolian erosion. In many places it has manifested itself by piling up mountains of sand in great dunes, and in other places the drifting sand has scoured the rocks into fantastic shapes and polished their exposed surfaces like an artificial sand blast. At the mouth of the San Gorgonio canyon, on the line of the Southern Pacific Railway, in Riverside county, Cal., not far from Whitewater station, the rocks on the west side of the road are carved in deep ruts and polished by the sand and gravel driven before fierce blasts of wind, which rush down through the narrow pass between the San Bernardino and San Jacinto mountains onto the Colorado desert, to fill the space made by the rapidly rising air which ascends from that heated land. Near Palm station, where the wind loses much of its force, the sand is piled up in great dunes, some of which rise 200 or 300 feet above the desert plain. Still farther down toward Pilot Knob, near the Mexican boundary, the winds which rush across the Salton Basin have piled up miles of sand dunes. These are ever shifting, always changing. On almost any clear day scores of whirling columns of sand, mounting often over 1000 feet into the air and visible for miles, may be seen over the vast expanse of this desert. These instances are only mentioned as characteristic of many other places on the Colorado and Mojave deserts of California, and in hot, dry, sandy countries everywhere. Along the sea coasts and lake shores, where not rocky, sand dunes are of very common occurrence. A large portion of the city of San Francisco, Cal., is built on sand dunes, formed by the drifting of sand from the shores of the Pacific, driven by a prevailing southwesterly wind. In places these piles are 100 feet or more in thickness. In some places growing forests have been enveloped by drifting sand, and in after years the sand blown away again exposes the dead forest.

The Kramer Stampede.

The Kramer bubble has bursted. The rich strike of a month ago has dwindled to the insignificant proportions of an ordinary prospect. From a great zone of gold ore rivalling the famous stories of Buffalo Hump in Idaho, it has come down to a few inches of ore of good grade, but nothing fabulous. The trouble with this last stampede is that it was located too near the railroad and too easy of access. To make the best of a "strike" of this kind and to secure a genuine rush, the new discovery must be many miles from a railroad and difficult of access. Telegraph and telephone communication must not exist within 100 miles, for these are means which will be promptly used to check the army of prospectors and adventurers which would otherwise be sure to join the stampede. There are prospects in the region of Kramer and also not far from Hinkley, a little farther east on the same line of railroad, and again near Barstow, but up to this time nothing has been discovered there which would justify a stampede of the smallest proportions. When news of these rich strikes is first received, the first impulse of those who are restless and anxious to go some place or to do something is to rush to the new field, in the hope of making a fortune suddenly either by finding a rich mine or by taking advantage of the existing excitement to turn an honest dollar otherwise; but the percentage of rich strikes that prove worth stampeding for is small indeed.

Many rich strikes are made which are good enough in themselves, but often it proves to be confined to a single mine, or perhaps two may result. Those at a distance usually have a poor chance to get a claim, unless the district proves to be a large one, as was the case at Cripple Creek and Leadville and in numerous other camps; but these are the chances a prospector must take, and he usually takes them.

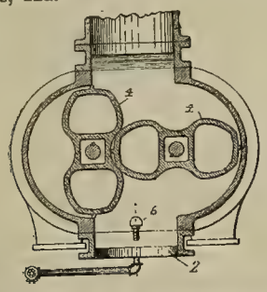
It is claimed and shown by expert evidence that parallel telephone wires, even though on opposite sides of a country highway, will interfere with the transmission of messages unless a return circuit is provided.

Latest Mining and Metallurgical Patents.

Patents Issued May 16, 1899.

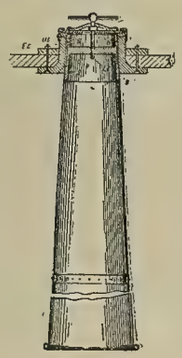
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROTARY BLOWER.—No. 624,943; E. D. Johnston, Connersville, Ind.



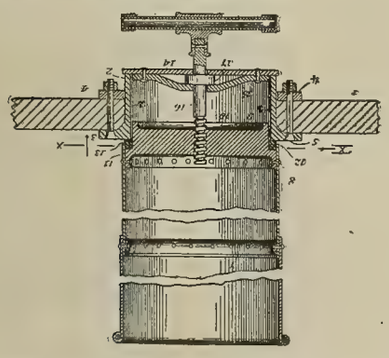
In a rotary blower, the combination of a casing having a bottom fluid inlet and a fluid outlet, a pair of intermembering impellers mounted within casing between inlet and outlet, a pipe leading to casing from source of supply of liquid under pressure and spray head connected with pipe and disposed within casing below impellers and above fluid inlet and adapted to spray and diffuse liquid upwardly into the uncompressed fluid on its way to impellers, whereby the fluid inlet serves also as the outlet for the rejected liquid; a fluid compressor, the combination of a case provided with a fluid inlet and a fluid outlet, rotary impellers above level of inlet, a liquid spraying device disposed below impellers and above level of inlet, fluid inlet being arranged to receive surplus liquid as it gravitates to the bottom of the case.

TANK BOTTOM DISCHARGE DOOR. — No. 624,957, L. H. Mitchell, Salt Lake City, Utah.



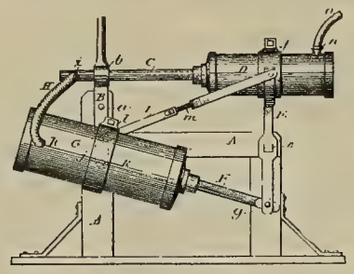
A discharge apparatus for tanks provided with a hollow upper portion, base attached thereto within lower end thereof and provided with spider or diaphragm, a casting adapted to receive base and means below casing co-operating with spider and supported by castings for disengaging base and upper portion from casting; a hollow portion, a frusto-conical base having integral bearing zones connected thereto within lower end thereof and a frusto-conical casting adapted to receive base and carrying means for unseating the same; a crossbar carrying a screw adapted to operate with said spider to unseat base and means for supporting crossbar.

TANK BOTTOM DISCHARGE DOOR.—No. 624,958; L. H. Mitchell, Salt Lake City, Utah.



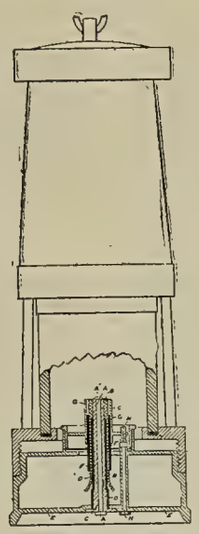
A discharge apparatus for tanks provided with a casting having a depending rim or edge, a funnel adapted to partially enter said casting and a plate or bar adapted to bear against said depending rim or edge having engagement with funnel to retain the latter in position; a straight plate or bar provided with means to detachably engage said funnel and force said plate or bar against said edge or rim; a ring below the tank around the casting and means for securing rim and ring in position, a funnel above casting, a base connected with lower end of funnel and provided with an annular offset or shoulder, a packing ring within offset and adapted to rest upon rim of casting, a plate or bar bearing against rim of casting, a nut-carrying screw in plate or bar adapted to engage base and draw same within casting, a brace or clamp connected to plate or bar, above nut on the screw and means for rotating the screw.

COMPOUND AIR COMPRESSOR.—No. 624,998; G. W. Wallick, Sturgis, Mich.



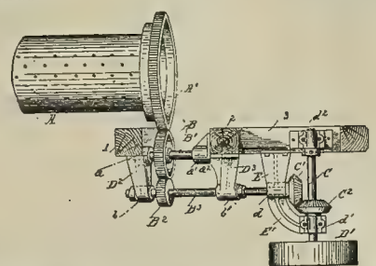
In a compound air compressor the combination of a cylinder *G* having solid piston *r* and rod *F*, and clamp *j* encircling cylinder *G* pivoted to lower end of lever *B*, a smaller cylinder *D* with hollow piston rod *C* and valvular piston *c* and outlet check valve *n*, the adjustable clamp *f* encircling cylinder *D*, the lever *E* fulcrumed on frame *A* connecting cylinder *D* with piston rod *F* and flexible pipe *H* connecting upper end of cylinder *G* and piston rod *C*, with a lever *B* fulcrumed on the frame *A* by bolt *a* and pivotally connected to sleeve *b* encircling piston rod *C*, the adjustable rod *I* pivotally connected beneath fulcrum *a* to lever *B* and to upper jaw of lever *E*, whereby lever *E* is operated.

APPARATUS FOR ELECTRICALLY IGNITING MINERS' SAFETY LAMPS.—No. 625,014; William Best, England.



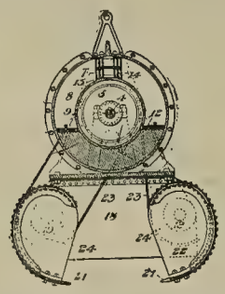
A miner's lamp having a metallic base, a wick and means for adjusting the same, a central conductor *A* and means for insulating same, in combination with a ring for receiving base of lamp, a central spring contact, an induction coil and connections therefrom to central contact and a contact for lamp base, a push switch actuated by lamp for closing an electric circuit to primary of induction coil so that spark from induction coil is directed across the wick to the metal of the lamp; a tubular wick *B* carried on a tube *D* securely attached to lamp bottom *E*, and an adjustable wick tube *G*, in combination with a central conductor *A* insulated from lamp bottom by an insulating tube *C* and carrying a cap *A'*, together with suitable apparatus for passing a current from cap *A'* across wick *B* to the wick tube *D*.

DRIVE MECHANISM FOR ROTARY GRIZZLIES OR SEPARATORS.—No. 625,274; R. H. Postlethwaite, San Francisco.



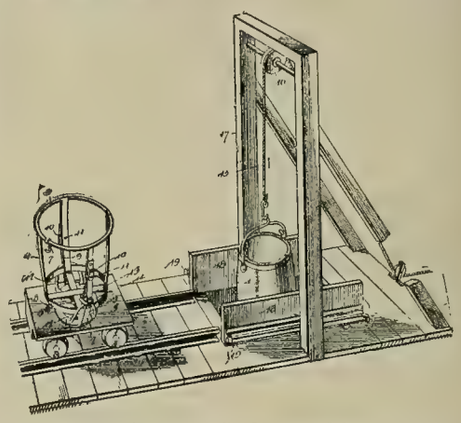
The combination with an inclined rotary grizzly or separator having a cog ring attached thereto, of an intermediate gear meshing with ring, a shaft for gear, a second parallel shaft carrying a pinion meshing with intermediate gear, an inner bracket formed integrally with two bearings, one for each shaft, an outer bracket formed integrally with two bearings, one for each shaft, a bevel gear on second shaft, a cross drive shaft, a bevel gear thereon meshing with other bevel gear, and a bracket formed integrally with two bearings arranged at an angle to each other for cross and parallel shafts.

EXCAVATOR.—No. 625,110; I. P. Lambing, Denver, Colo.



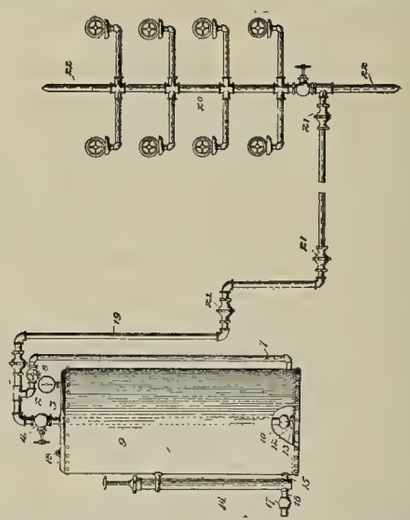
An excavator, a pair of swinging buckets, and mechanism arranged to swing ends of buckets inwardly and upwardly past each other; buckets eccentrically mounted, so that when swung inwardly their ends rise toward each other, and a rotary motor connected to and arranged to actuate buckets; rotary shafts, a disk secured to shaft and connected to an oscillatory piston, and an arc-shaped chamber in which piston oscillates.

BUCKET CAGE FOR MINING CARS. — No. 625,035; Willis Knapp, Salt Lake City, Utah.



A device of class described comprising a support designed to be mounted on a car and arranged to rotate on vertical axis, and tilting bucket receiving cage carried by support, whereby contents of a bucket may be discharged in any direction; receiving cage provided with opposite standards, braces supporting standards, a cage adapted to receive a bucket and pivotally mounted between standards, and a substantially U-shaped locking device hinged to one of standards and provided with arms arranged to engage the cage and supported in its engaging position by the adjacent brace.

PORTABLE DEVICE FOR THAWING FROZEN GROUND.—No. 624,945; L. L. Kendall, Williamsburg, Ky.



In combination, supply tank and burner battery flexibly connected therewith, the alined handles 22, 22 fixed to battery and a controlling valve fixed intermediate one of handles and burner.

Electrolytic Corrosion.

In our issue of January 19, 1898, says *Electricity*, referring to the equipping of the elevated railways in New York City with electricity, we incidentally called attention to the fact that these structures were none too strong for the number of trains they were carrying or would have to carry when the proposed change of motive power was effected, and added: "If the Brooklyn bridge is in danger of being destroyed by electrolytic action, as several newspapers would have us believe, there would seem to be no reason why the elevated structures should not likewise be affected."

That electrolysis is going on in certain portions of these structures is now shown to be the case by an examination recently made by an electrical engineer representing the State Board of Railroad Commissioners. The report submitted says:

"I have made 867 tests, covering all portions of the city where the Manhattan Railway Company's structure is located. These tests were made from the supporting columns of the structure of the elevated road to the water pipe, gas pipe and rails of the surface under it. All tests were made with a standard Weston voltmeter, with scale divisions reading to thirty. One side of this instrument was connected by wires and clamps especially made for this purpose with a column of the elevated structure, the other side with a water hydrant and gas post and also with the rails of the surface street railroad. A reading of the voltmeter was taken after each connection was made, making three separate tests at each point where a test was made. These were commenced on January 24 and completed on April 20, 1899. All were made while the ground was frozen. The results of these tests were given in a table accompanying the report.

"These show that at the time of making the tests the maximum difference of potential between the elevated structure and the water pipe near it was found at the Manhattan end of the Brooklyn bridge, where there was a difference of potential of two and a half volts. The next highest potential was found in the neighborhood of the Union Railway Company's system at 135th street. At these two points of maximum difference of potential, the elevated structure was positive to the metal conductors in the earth near it, showing that a current of electricity was flowing from the elevated structure to them."

This electrical examination of the Manhattan Elevated Railroad's system in behalf of the State Railroad Commission would seem to corroborate the tests made some time ago by Mr. A. A. Knudson, who incidentally found that the pillars of the elevated road at 135th street were positive to the water mains in the vicinity from one-thirtieth to one-third of a volt, depending on the hour of the day, and that likewise the elevated structure at the New York entrance of the Brooklyn bridge was undergoing electrolytic action. In a paper read about a year ago before the American Institute of Electrical Engineers, referring to this subject, Mr. Knudson said:

"The tests were continued at the New York entrance of the bridge, and at the pillars which stand in the street just west of the Third avenue cable railway I found the readings as follows: At one pillar a maximum of three volts, average one and a half volts, pillar positive to Third avenue cable rails. At another, practically the same reading. Further up Park Row, at the corner of Chambers street, pillar positive to cable rails, one volt maximum; water positive to cable rails, one-half volt; pillar positive to water, one-third of a volt.

"All of these tests were nearly a year and a half ago. A few days ago tests were made over this same ground, and at the places where a difference of potential of three volts maximum existed at that time it is now found to be 3½ volts, pillars positive as before to rails of Third avenue cable and also to water pipes, showing in all probability that this current has been during all this time actively and unceasingly passing down the pillars which support the 'L' station at this place, as well as the bridge crossing the street, and out from their foundations to other metals, as stated, with now a fifth of a volt more for good measure.

"In the light of present knowledge on this subject the very serious question presents itself to any practical mind here present, in what condition would we expect to find the anchor bolts and iron foundations of these pillars if excavations were made at their base.

"In Mr. Farnham's excellent paper, read before this Institute four years ago, he showed that but a small fraction of a volt was necessary to establish electrolytic action between metals."

In view of the last statement in the above paragraph, the truth of which is now generally conceded, having been only too forcibly substantiated by experience, it is rather difficult to see how all danger of electrolysis to the elevated system will be averted by the adoption of the following recommendation made by the Board of Railroad Commissioners' expert:

"That the Manhattan Railway Company immediately put their structure in such condition that at no point will it be positive to other conductors in the ground more than one volt and at this point be maintained."

Personal.

VICTOR M. CLEMENT has gone to Europe.

W. S. WEBBER has been appointed foreman at the W. Y. O. D. mine, Grass Valley, Cal.

JEROME B. FRANK of Denver, Colo., has gone to Hailey, Idaho, where he has mining interests.

MR. WETHERLY, a mining engineer of Chicago, has been visiting mining sections of Shasta county, Cal.

JOHN DAGGETT has returned to San Francisco, Cal., from a visit to his mining property in Siskiyou county, Cal.

W. A. WATSON of Deadwood, S. D., is now at Victor, Colo., and will be Supt. Economic Gold Extraction Co.'s chlorination plant.

SAMUEL HARTLEY, who was recently appointed Mgr. Burnt Creek mine, Victoria, has assumed the duties of his responsible position.

PATRICK HOLLAND, for some time past foreman at the Empire mine, Grass Valley, Cal., has resigned. He is succeeded by James Seymour.

CLARENCE KING, E. M., has been inspecting mines in Shasta county, Cal. He was accompanied by C. A. Hamilton and L. A. Scowden of San Francisco.

JOHN W. MACKAY, who with W. R. Eckart has been making examinations of property owned by Mr. Mackay in Arizona, has returned to San Francisco.

R. D. GRANT, who for three years has been Mgr. of the Parrot properties at Butte, resigned that position May 11. Mr. Grant will visit Arizona and Mexico, where he holds large mining interests.

RALPH NICHOLS, at one time Supt. Sutro Tunnel at Virginia City, Nev., and now Mgr. of mines at Kalgoorlie, Western Australia, has left New York for Australia, having purchased mining machinery for the property under his charge.

D. E. THORNTON, Gen. Mgr. Tararu Co., in New Zealand, has appointed R. Tierney Mgr. of the mine, to succeed the late Mr. McLean. Mr. Tierney has been managing the Ethel Reefs G. M. Co.'s mine in the Hape creek district, and he is succeeded at the latter place by G. Gill.

Industrial Notes.

—The Company Industrial has established a steel works in Chihuahua, Mexico, which when completed will have cost $250,000.

—The National Steel Co., which has two furnaces and two steel mills at Mingo Junction, W. Va., has bought 110 acres of land adjoining its Mingo Junction property, on which two furnaces of 500 tons daily capacity are to be erected, besides another steel plant and a finishing mill for bars, sheets and merchant iron. The improvements, including real estate, will cost nearly $1,000,000.

—Boston News Bureau: At no period within fifteen years has the iron trade of the country been in such a booming condition as at present. The chief trouble seems to be in getting material, either crude or finished, with which to fill orders. Furnaces and mills in all sections of the country are declining to take business for delivery in the near future, and some companies are even refusing orders requiring delivery during the current year.

Recently Declared Mining Dividends.

Tamarack M. Co., Mich., quarterly dividend, $4; payable June 27.

Mt. Shasta G. M., Ltd., dividend No. 1, $6000; payable June 1.

Homestake M. Co., South Dakota, regular monthly dividend, $62,500; May 25. Total for 1899, $312,500; total to date $7,493,750.

Recent Mining Incorporations.

Confidence Oil Co., Fresno; capital stock $48,000, all subscribed; J. P. Vincent, W. Helm, F. Cleary, E. A. Walrod, E. W. Risley, all of Fresno.

Hudson M. & M. Co., San Francisco; capital stock $200,000, subscribed $500; G. E. Faw, J. W. Morrell, J. D. Beggs, J. L. Green, J. H. Peters.

San Emedio Oil Co., Selma, Fresno county; capital stock $250,000, subscribed $150,000; H. F. Peters, E. M. Stevens, W. I. Roberts, M. McWhorter.

Minnehaha G. M. Co., San Francisco; capital stock $100,000, subscribed $50; S. W. Payne, R. Payne, J. Osborne, B. Lomond, R. E. Payne, C. S. Payne.

Con. Pacific Co., Ltd., Redding, Cal; capital stock $100,000, subscribed $67,200; R. M. Mooer, C. A. Farnsworth, S. J. Gray, C. Rossi, R. Rusconi.

Fresno & Hanford Oil Co., Fresno; capital stock $180,000, subscribed $100,000; H. Nathan, J. R. Walton, C. J. Woodward, A. Goldstein, L. L. Cory.

Commercial Paragraphs.

JAS. MACBETH of New York City, manufacturer of electric blasting supplies, etc., has established a San Francisco agency at 308 Market street, in charge of Newton I. Steers.

THE Jeanesville Iron Works Co. of Jeanesville, Penna., have recently shipped a large mining pump to Leadville, a No. 9 B. sinker to Webb City and a No. 5 sinker to Empire, Colo., also a mine station pump to Independence, Colo.

Books Received.

"*Wonderland in '99.*" A handsomely illustrated descriptive pamphlet has been received from the Northern Pacific Railway, illustrating the scenic features along the route of that road. It is written in itinerary style and is very pleasing from several points of view. It will be mailed to any address on receipt of 6 cents in stamps by addressing Chas. S. Lee, Gen. Pass. Agent, St. Paul, Minn.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 16, 1899.

625,020.—FASTENING FOR CYCLE SEATS, ETC.—E. H. Chappuis, Marysville, Cal.
624,912.—COPY HOLDER—W. Cord, Los Angeles, Cal.
625,292.—VALVE—D. C. Demarest, Angels, Cal.
624,925.—LOTION—C. E. Grapewine, San Diego, Cal.
625,300.—BRAKE—G. B. Heath, S. F.
625,040.—DOOR MAT—C. Kuhn, Fruitvale, Cal.
625,041.—TREE TRANSFERRER—L. H. & H. S. Landis, Orangevale, Cal.
625,048.—BOOK HOLDER—A. Marks, S. F.
625,053.—SHIPPING CAN—D. J. McKay, S. F.
625,050.—LOOSE LEAF BOOK—L. M. Morden, Portland, Or.
625,191.—LOOMS—J. H. Northrop, Tustin, Cal.
624,965.—SIFTER DRUM CLEANER—C. H. Oester, S. F.
624,967.—HARROW—H. Paulson, Sumner, Wash.
625,200.—VEHICLE WHEEL—T. Pinard, Clackamas county, Or.
625,274.—DRIVING MECHANISM—R. H. Postlethwaite, S. F.
624,988.—BOOM OR GAFF—H. B. Smith, Fruitvale, Cal.
625,320.—CURRENT MOTOR—W. Turner, Wenatchee, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHIPPING AND DELIVERY CANS.—Donald J. McKay, San Francisco, Cal. No. 625,053. Dated May 16, 1899. This invention relates to a can which is especially designed for shipping such goods as coffee, tea, and other dry solids of a like nature and to a means for drawing or delivering substances therefrom. It consists of a vessel having a hinged closing top, a false bottom inclining downwardly from the rear to the front and made concave, a discharge spout extending in line with the inclined bottom having when in use an unobstructed open end, a cap adapted to cover the open end of the spout, and a closed housing with a gate guided vertically for the purpose of opening and closing the discharge spout.

DOOR MAT.—C. Kuhn, Fruitvale, Cal. No. 625,044. Dated May 16, 1889. This invention relates to a mat, and consists essentially in the combination of the main exterior frame having compartments, one of which is occupied by inter-locking metal plates, the edges of which are pressing backwardly to form a preliminary scrape or cleaning device, and the other, by a fibrous or other suitable mat which serves for cleaning, and having an independent frame and adapted to be removably fixed in the other section, so that it can be taken out at any time for cleaning, or for replacing. The two form a serviceable mat for cleaning the feet, the main portion of the dirt being removed by grating through which it falls, and the cleaning being completed by the fibrous portion.

TREE BALLING AND TRANSFERRING DEVICES.—L. H. and H. S. Landis, Orangevale, Cal. No. 625,041. Dated May 16, 1899. This invention relates to a device for performing the operation known as "balling" in the transportation of trees and shrubs. In consists essentially of a sheet-metal cylinder having the meeting edges disengageably connected, a means for placing the cylinder around a tree or shrub to be removed, and forcing its sharp lower edge into the soil around the roots of the tree, and a bottom adapted to be slipped in beneath the cylinder to enclose the tree, with means for securing it to the cylinder, so that the whole device, with the enclosed tree, may be lifted from the hole and removed to some ohter point without disturbing the roots or interfering with the growth of the tree.

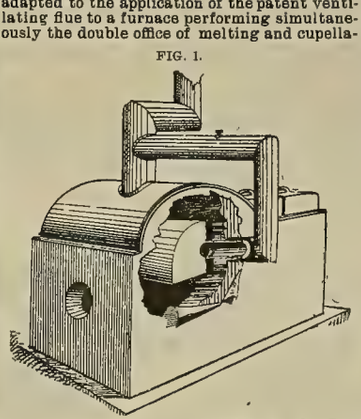
CYCLE SEAT AND HANDLE-BAR FASTENING ATTACHMENTS.—E. H. Chappius, Marysville, Cal. No. 625,020. Dated May 16, 1899. This invention relates to a means for securing the saddle, saddle-post, handle-bar steering posts, and handle bars of cycles, by the employment of cam locking devices with a means by which they are directly operated without the use of screw-threaded bolts and nuts or wrenches. The parts which are movable over each other have interlocking corrugations formed on their contiguous faces, these being separable to allow of the movement and adjustment of one of the parts, and they are locked at any point of adjustment by means of a cam operated by a handle, or otherwise so as to force the two corrugated faces to interlock with each other, thus holding them firmly in place; they are disengaged for any other adjustment by simply turning the cam in the opposite direction.

A New Assay Furnace.

The "L. & C." patent combination furnace, owned and manufactured by F. W. Braun & Co., Los Angeles, Cal., is the result of a close study of the requirements of the practical assayer, and, with the patent muffle ventilator attachment—one of its special features—is the most efficient and satisfactory furnace ever placed on the market.

By reference to the accompanying illustrations, it will be seen that it has the novel feature of a muffle lying transversely to the melting compartment, which arrangement is adapted to the application of the patent ventilating flue to a furnace performing simultaneously the double office of melting and cupellation a forced draft throughout the entire length of the muffle, the fresh air thus supplied furnishing abundance of oxygen, so that cupellation is both rapid and complete in all parts of the muffle.

FIG. 1.



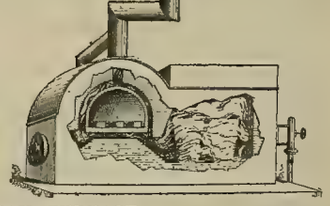
The furnace is supplied with a center pivot, by which it may be revolved, thereby enabling the operator to introduce the flame at either end at will from the one burner.

The melting compartment has a hinged bottom, which is covered with a mixture of coke and fireclay. In case of a bullion spill the trap can be opened and the bottom removed without disturbing the brick work of the furnace.

The standard size takes a muffle 6x10 inches and has a melting compartment 7x7x7 inches which will hold four crucibles, each with a capacity of two assay tons of pulp, and weighs complete about eighty pounds. With this size furnace it is possible to make 100 assays in a twelve-hour run.

Since coming into the hands of the present owners, the L. & C. furnace has been greatly improved in effectiveness as well as general appearance, changes having been made that render its working perfect in all its parts, so

FIG. 2.



THE L. & C. ASSAY FURNACE.

tion. The ventilator promotes rapid oxidation throughout all parts of the muffle, carries off the fumes of cupellation and enables the operator to work with a degree of comfort not possible heretofore with this class of furnaces.

The ventilator referred to is a separate outside connecting pipe between the muffle and the stack, as shown in the illustration. The heat arising in the main flue creates by induc- that its convenience, compactness and economy of operation appeal to every practical assayer.

In the illustrations Fig. 1 is a view of the furnace showing the oxidizing bonnet and muffle draft; Fig. 2 shows melting and cupelling carried on at the same time. In both views the front is broken away to show the interior construction. *

California Redwood.

The habitat of the redwood is peculiar, says Henry Gannett in the *National Geographic Magazine*. It is found only in a narrow strip, closely hugging the Pacific coast, stretching from the southern boundary of Oregon or just across the boundary—for there are perhaps 1000 acres of redwood in Oregon—southward through northern California, nearly to the bay of San Francisco.

The closest and finest growth is in Humboldt county, near the northern end. That portion in Mendocino and Sonoma counties is not as heavy or continuous, nor are the trees as valuable for lumber, as they branch lower down. The wood is, however, of slower growth, is denser and harder, and perhaps more durable. The best lumber and the heaviest growth are everywhere in the valleys and on the flats. On the hillsides the trees are smaller and not so close. Nowhere is there any young growth. The youngest trees, which are found only in the northern portion of the belt, are several hundred years of age.

This is probably the densest forest on earth, as measured by the amount of timber per acre suitable for the sawmill. It is not the size of the trees alone which produces this, although they are exceptionally large, even in this State of large things, but it is the great number of trees, the closeness of their stand. In a redwood forest the sun never shines—it is always twilight. You are, as it were, under the roof of a vast temple, a roof of foliage, supported by great tree columns.

The area of the redwood belt has been carefully mapped, and is, as nearly as can be estimated, 2000 square miles, or 1,280,000 acres. The stand of timber on this area is not so easy to ascertain, but may be computed thus:

	Feet.
Del Norte county	4,000,000,000
Humboldt county	42,000,000,000
Mendocino county	28,160,000,000
Sonoma county, say	1,0.0,000,000
Total	75,160,000,000

The annual cut by the mills is 250,000,000 feet. At the present rate of cutting, therefore, the supply will last 300 years. In Mendocino county there is nearly nine times as much timber on an acre as in the Southern pineries; in Humboldt county, upon 96,443 acres, the average stand is 84,000 feet per acre, nearly seventeen times as great as in the Southern States.

There is one cause of destruction from which this tree is entirely exempt—that is fire. Containing no pitch, but, on the other hand, a large amount of water, it will not burn when green. No fire can run in a redwood forest. It is the only one of our coniferous lumber trees which is thus exempt.

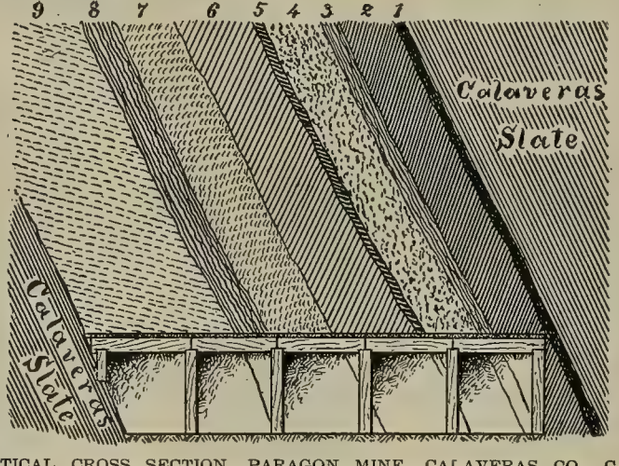
Redwood is in almost universal use on the California coast. In the construction of houses little other timber is used, even as far south as Los Angeles and San Diego. It is exported as far south as Valparaiso, Chili, and westward to Japan and Australia. Indeed, considering its cheapness—$14 per thousand feet in Eureka for the best—it seems strange that it has not found its way in quantity to the Atlantic coast. Certain it is that before many years redwood will supply the now vanishing white pine in Eastern markets.

The above article was evidently written from a commercial standpoint, as it is a well-known fact that the redwoods extend southerly along the Pacific coast in California as far south as northern Monterey county, and, although the trees are in many instances of gigantic size, the area covered by the growth is relatively small, and is not considered as of any commercial importance by lumbermen. The redwoods growing in the Sierra region are of different species, being the *Sequoia gigantea*, the coast variety being known as the *Semper-virens*.

Redwood has been used extensively in numerous California mines, notably in the quicksilver mines of New Almaden in Santa Clara county, and it has given entire satisfaction. While its resistance to crushing is less than that of some other woods, and it is more brittle than pine, more timber is being employed and, being cheap, costs no more than pine and is found far more durable. Redwood has not been used in the mines of the gold belt, but there are many places where it could, no doubt, be used to good advantage, particularly in those mines where, owing to damp, close air, pine timber decays rapidly. It would, no doubt, be better also, from a sanitary point of view, as decaying timber in mines produces foul gases and disagreeable odors.

The Paragon Mine, Calaveras County, Cal.

An interesting development has been made in the Paragon quartz mine, on the Licking Fork of the Mokelumne river, near Railroad Flat, in Calaveras county, Cal., by the Paragon Con. Gold Mining Co., of which Percy L. Shuman is manager. The mine is on the east lode of the gold belt, and in it has been developed one of the largest veins on that belt. The formation in which the vein occurs is the black slate known as the Calaveras formation, which appears so frequently along the east lode. The accompanying drawing illustrates the interesting succession of rocks making up the pay zone or vein proper.



VERTICAL CROSS SECTION, PARAGON MINE, CALAVERAS CO., CAL.

The hanging and foot walls, as stated, are the black slates of the Calaveras formation. No. 1 is black gouge; No. 2, black quartz; No. 3, ribbon quartz; No. 4, a mass of brecciated quartz, intermingled with slate; No. 5 is gouge; No. 6, gray quartz; No. 7, black and white quartz; No. 8, ribbon quartz; No. 9, gray quartz, heavily impregnated with auriferous sulphide. The latter is the richest portion of the mineral zone, the total width of which is about 30 feet. The relative width of the several strata is about as indicated in the drawing.

The property is equipped with a 10-stamp mill and other accessory buildings. It is worked through tunnels with several hundred feet backs, and is one of the newest of the prominent mines of Calaveras.

Anti-Darwin.

TO THE EDITOR:—I lately had the pleasure of reading an article by Talcott Williams, which, while not intended apparently as an anti-Darwinian argument, bears so strongly that way, that I beg to present to your readers a short note thereon. Mr. Williams thinks it not only unscientific but improbable to assume that modern savagery is at all like the primeval savagery. The low, modern savages are the products, probably, of degradation; certainly, of unfavorable circumstances—wars, bad climate, struggle for food (which is the flat antithesis of the Darwinian idea that a struggle for food improves the race, and, in my opinion, the former is good sense and the latter is not), the presence of surrounding people, etc. He thinks it far more probable that originally various tribes, being separated by empty spaces and under easy conditions of existence, had none of those vices and superstitions created by wars and other evils consequent on a greater population. "If we think of the empty earth as early bearing separate centers of civilization, too far apart to vex his neighbor," the conception is certainly more in accord with early records and known facts, and with what seems to me just deductions. I have no space to go into further details of this sensible paper, and only add one remark of my own.

I consider it fairly plain, under any theory, that mankind has originated from several originals; but whether one or several, it must necessarily be that for a time the conditions assumed by Mr. Williams did exist: that life was easy, no crowding within, or war, or any interference whatever from within, no slavery or polygamy, and no superstition—because that is born of fear, and that from oppression, products of later times—and, hence, that no theory is of any value which is based on the common idea that modern savages are like the original ones, or that civilization was evolved from such.

W. S. PROSSER.

Auburn, May 18th, '99.

The Copper Deposits of La Sal District, Colorado.

A correspondent of the *Western Miner and Financier* describes the new copper mines of Montrose county, Colorado, in La Sal mountains. as follows:

The Angel and Red Chief mines—or, as they are known, the La Sal mines—are located so as to give a good opportunity to study the geological formation, as there is but little slide or debris covering the solid rock, the canyons rising from 100 to 300 feet perpendicular, and above that rising in rocky benches to a height of from 500 to 800 feet. The ore was first discovered in the Red Chief in the face of the cliff about 100 feet in height and 75 feet above the water level in the gulch. The vein was heavily stained with copper and contained some copper glance at the surface. For some distance from the original location of the Red Chief through to the Angel mine the vein shows good width in its croppings.

The formation is white sandstone from near the bottom of the gulch to a height of between 400 and 500 feet. Underneath the white sandstone is red sandstone, the strata being nearly level. At different elevations in both series of sandstone are found what appear to be contact veins, which lie nearly flat and are heavily stained with copper, but so far as yet seen little development has been done on them. One of these contacts was followed for a distance of six miles, and the contact veins seem to be continuous for a great many miles in every direction. The contacts vary in thickness at different intervals, but wherever work has been done they are usually 6 feet in thickness. At the intersection of the contacts and fissures the largest and richest ore bodies occur. This particularly is true in the Red Chief.

A Native Iron Works in Africa.

On nearing the village, little streaks of smoke could be seen, and the tinkle, of hammers could be heard, accompanied by a humdrum song. On approaching, every inhabitant seemed to be a blacksmith; children carrying charcoal; elder children, men, and women blowing the bellows, accompanying and timing the stroke with measured chant and much apparent banter; but, whether smelting iron or forging hoes or other simple agricultural implements, fishhooks, arrow heads or knives, the stock in trade was essentially the same.

The bellows looked like two large, rude golf sticks, secured together, the stick proper being about 3 inches in diameter, and the striking end about 10 inches in diameter by 8 inches deep. A better comparison might be imagined if two banjo heads were knocked to one side, one to the right and the other to the left of the fingerboard, and strapped together. The blast hole, 1 inch in diameter, ran up the length of the fingerboard, and the open end of the banjo head had loose, soft pigskin strapped around it to give a lift of 6 inches or thereabouts, there being a center knob to hold on by; a rude inlet valve, consisting of a square frame and soft leather facing, was at the outer rim, and a like outlet valve at the bellows end of the fingerboard. Each stroke gave an effective air flow of about 400 cubic inches, and each blower made from thirty to sixty strokes per minute.

These bellows betokened probably the improvements of some half-caste Portuguese, as other bellows have no valves, but blow into an enlarged funnel-shaped tuyere, drawing the air up and down the tube alternately. These latter are most common and very inefficient. Monteiro says he never saw any other bellows than the latter, and he identifies them with the bellows of the ancient Egyptians.

The fireplace was, in all cases, a simple cavity, scooped out of the ground, and the fuel was charred wood. The smoke, noticed in approaching the village, came from burning wood heaps. Knives and spear or arrow heads were incased in clay cases, containing charcoal and some substance—I could not learn what—and baked in the fire for a number of days, and then the fire was allowed to gradually die out. Unquestionably, therefore, the natives must have had some knowledge of a cementation process, or an approach to it, for the improvement in the quality of their iron. Final tempering was effected by immersion in palm oil. Whether smelting or forging, the furnace was the same, viz., a hole scooped out of the ground, charcoal used as fuel, and a mixture of clay added as a flux for smelting. The heaviest smeltings I saw in block were not more than four or five pounds in weight; but much heavier ones were occasionally undertaken, as the heavier anvils were apparently smeltings run into moulds, and were afterwards bedded into blocks of hard wood, weighing about twenty-eight pounds.

Malleable iron was derived from the castings by repeated smelting, and finally by heating and reheating to a spongy mass and working under the hammer. I did not see this process carried through; but it must be a slow, tedious one, as I saw no native malleable iron lumps of any appreciable weight. I was surprised to find such a resemblance between the mechanism of our own fire tongs and those used by the ironworkers in Cazengo; but one of the Roman Catholic priests of Ambaca, whose acquaintance I made, assured me that they were entirely of native origin. In heavy smelting a number of bellows surrounded the fireplace and led into a number of tuyeres, each bellows blowing into its own tuyere, and every three bellows leading into a central tuyere.—J. M. Nisbet, in Cassier's Magazine.

Mining Summary.

ARIZONA.

Phœnix *Republican*: C. C. Bean of the Ajo mines says his ore is good grade, but he has been unable to find a water supply. The Shotwell camp near there is the same kind of proposition as the Ajo. The owner has succeeded in getting a water supply and new machinery has been ordered. The ore is running 55% copper and $18 in gold per ton of concentrates.

Bisbee *Orb*: The new shaft at the Copper Queen has reached a depth of 100 feet and miners are cutting the station. The donkey hoist has been running some time and cages have been placed in the shaft. The collar of the new shaft is 140 feet above that of the Holbrook. It will be some time before connections can be made with the 100 level of that shaft.

Prescott *Journal-Miner*: The sale of the Buster and Standard group of mines has been consummated and $33,500 paid to J. A. Forbes and J. McKenzie. The purchasers are Baltimore people, represented here by Hooper & Williams. The property is in the Bradshaw mountains near the Crowned King and is opened by a shaft 125 feet and a tunnel 500 feet in length, besides other openings. The lead runs from 3 to 7 feet, the ore going as high as $40 per ton. A mill is to be placed on the mine having a capacity of forty stamps. —— Another deal was closed in which G. Rhopeter disposed of the Lone Pine property in Big Bug district. The mine is three miles from Huron on the P. & E. railroad. The ore is said to carry 29% copper and gold and silver. Wm. Claypool of the Arizona Ore Co. secured an option from Mr. Rhopeter. The price is stated to be $25,000, 10% down and the balance within a year.——Reports are received that a strike has been made in the Congress mine on the 2000-foot level, where ore running fourteen ounces per ton has been found and on the 1700 level the ore body has widened to 12 feet.——At the Polar group of mines, adjoining the Crown Point group, the new mill is ready to steam up. It has ten stamps with extension for twenty. Mr. Belcher says work on the Polar group has resulted in a satisfactory showing. Work will soon be suspended pending the purchase of a steam hoist. The deepest shaft on the claims is 100 feet.

CALIFORNIA.

Amador.

The South Spring Hill mine is being made ready for operations. Men are at work cleaning out and repairing a tunnel which runs into the shaft from the hillside above the road. The mine has been idle for a long time.

Sutter Creek *Record*: Operations have been suspended at the Douglas mine, near Volcano, and the pumps taken out. The prospect work has been carried down to a depth of 400 feet. The last work done was 180 feet of crosscut by hand-work in twenty-eight days on the 400 level.——S. K. Thornton of San Francisco has bonded a mine near Plymouth from G. Easton and is erecting a hoist and other machinery. ——The Allison mine, two miles west of Plymouth, is being operated by Stockton parties. They have ore on the 100-foot level.—— J. Bernardis, who has the F. Werner property bonded, is getting good prospects.

Amador *Republican*: The selling of the Bunker Hill and Mayflower mines north of Amador City, under the control of the same company, will take place in June.——Supt. D. Fisher is sinking a new shaft at the Spagnoli mine. The shaft is down 20 feet. A 10-stamp mill is to be built. This mine is near the Clinton Consolidated on a ledge which runs east and west.——Negotiations have been in progress for some time for the purchase of the Little Amador mine at Amador City.——The Keystone is running both mine and mill. Hottenger & Bro. are operating the sulphurets plant.

Butte.

The Butte Creek G. M. & P. Co., near Nimshew, after a long period of litigation, has resumed operations.

Oroville *Mercury*: J. McClung has let a contract to A. Hamilton for the removal of a quartz mill from the Sunnyside mine, near Robinson Mills, to the Lydia mine, also known as the Lawton mine, near Powell creek, in the Enterprise district. The hoist and an engine are to be left at the Sunnyside, on which Mr. McClung intends to sink.

Oroville *Register*: The Golden Trout mine, on the South Fork of Feather river, between Lumpkin Mills and Strawberry valley, employs twenty-three men. South tunnel No. 12 is in 100 feet to the ledge, 8 feet wide. The rock is reported to be rich. It is proposed to bring a ditch from Rock creek, on the west side of South Fork canyon, three miles, giving a supply of water at the mill with a pressure of 400 feet.

Calaveras.

The Fellowcraft mine, east of San Andreas, is to be operated by a new company, with C. C. Clark as Supt. and Mgr.

The Boston Stock Exchange has listed the Melones G. M. Co., with a capital of 200,000 shares of $10. The property is located on Carson hill. The directors of the company are W. E. C. Eustis, C. M. Weld, G. H. Morrill, Jr., J. Parker, J. C. Whitney, C. N. Felton and W. C. Ralston. In the upraise above the 600 level the last assays show $12.40.

The Prussian Hill mine has made its first cleanup, which is said to have been satisfactory. This property is owned and was reopened by C. & B. C. O'Neill of Jackson.

The directors of the Boston mine, near Mokelumne Hill, held a meeting May 5th and decided to sink to 1500 feet. The present depth of the shaft is 1000 feet. A compressor and pump were ordered put in.

San Andreas *Citizen*: W. H. Clary, Jr., will begin development of the Flamm property, near San Andreas. A hoist will be erected and sinking begun.——The machinery is being put in place at the Sheep Ranch mine. ——At the Ford mine a large pump is needed to clear the 700-foot level of water. The necessity of enlarging the milling capacity is apparent.

El Dorado.

Placerville *Republican*: A. J. Crain, Supt. of the Plymouth ditch and other property owned by Hayward & Lane, near Indian Diggings, says Hayward & Lane are preparing to do hydraulic mining in the gravel hill east of Indian Diggings, and have bought land of Mr. Koblert for a debris dam, which is now completed, and they are waiting the inspection of the Debris Commissioners before commencing work. There is a large body of gravel, which they have been prospecting by means of tunnels. It is an ancient river channel. The wash from it supplied most of the gold taken out of the shallow placers of Indian Diggings. Mr. Crain will superintend the work and O. Ball will be foreman. They have twelve men employed. The company owns its own ditch, which takes water from the Cosumnes river above Pl Pl valley.

Placerville *Nugget*: W. R. Pearson, owner of the Mt. Hope mine near Grizzly Flat is making arrangements to open the mine.

Kern.

Randsburg *Miner*: The Kinyon mine has cleaned up a run of thirty to forty tons of low-grade ore, which went $10 per ton. This was screenings from the dump. They are now running rich ore from the mine.——A large flow of water was struck a few days ago in the drift from the shaft at the Yellow Aster water wells. The increase for the first twenty-four hours after was noticeable, and 30,000 gallons more water were sent to the mill than ever before in one day.

Madera.

J. A. Fersom of Stockton has sold the Ne Plus Ultra copper mine, nine miles from Madera, for $125,000, to New York capitalists. It is reported that the company which bought the mine in Madera will put up a $150,000 smelter.

These mines are in the Buchanan belt, about five miles from Raymond, the terminus of the branch railway from Barenda, on the Southern Pacific Railroad. The copper mines of this locality were opened to a depth of 100 feet or more and some stoping done years ago. The formation is mica schist.

Mariposa.

(Special Correspondence).—The Quail M. & M. Co., incorporated by business men of Sonora, has taken over the bond held by Kendall & Whitney on the Quail mine of D. Bruschi, on Indian gulch. They have bought the boilers, hoist and 4-stamp mill now on the Louisiana, and will erect them on the Quail, where a considerable amount of ore is blocked out. Heavier machinery will be placed on the Louisiana later.

The Mt. Gaines plant, west of Hornitos, is running with electricity from Merced Falls, eight miles distant. The mill is run by one motor, while a second operates the air compressor, whence the drills, pumps and hoisting engine are operated.

The Columbus M. Co. is drifting in good ore on Horseshoe Bend mountain.

The 6-stamp mill on the Porter mine is running on ore averaging $10.

At Boston, on the 3rd inst., the directors of the Merced G. M. Co., authorized an increase in capital stock of 50,000 shares, of $15 each, raising the capitalization to $2,250,000. The stockholders will ratify this action at Butte on June 27th. The proceeds, according to a Boston interview, will be used to build an electric power plant, increase the milling facilities and do development work. Work on the electric plant will begin at once, and outstanding cordwood contracts are cancelled. The contest with the Eagle-Shawmut Co. in Tuolumne county over the Oak Flat ditch is settled, and this will be used for power. Water will be taken from the South Tuolumne at Hardins, carried ten miles in the rebuilt ditch to Colfax and returned to the river with a fall of nearly 2000 feet. The distance thence to the mines by air line is about fourteen miles. There will be installed an excess of power over the needs of the company and the surplus will be sold throughout Mariposa and Tuolumne counties. The furnishing of cheaper power than steam will be of great benefit to Mariposa county mining. Including the unpaid $3, which has been called in on the old stock, Merced will have available for this work $1,050,000.

Groveland, May 21st, '99.

Nevada.

The new mill of the Pennsylvania Co. at Grass Valley is running.

The Grass Valley Expl. Co. have completed at the W. Y. O. D. mine a plant for saving concentrates, built under direction of G. G. Gates. It is located east of and adjoining the mill, and will concentrate the slimes.

Oroville *Mercury*: C. C. Bitner of Spenceville has sold his quartz mine located near that place to New York capitalists. The mine is named the Mineral Hill. It has been developed, but there is no mill on it. The price is said to be $25,000.

Grass Valley *Telegraph*: The new 10-stamp mill at the Pennsylvania mine has started up. The mill was built by W. S. May. Three new concentrators are being put in. The power used is electricity, generated by an 80 H. P. motor. The mill will be in charge of W. Wheeler.

Grass Valley *Union*: At the Reddik mine a new shaft is being sunk directly over the old one, 140 feet from the bottom, to overcome the difficulties experienced by the influx of water encountered some time ago, which caused ground to cave.——At the Home mine at Blue Tent Supt. Logan has cut a station in the shaft. A new office building has been erected and other improvements made.

Orange.

Santa Ana *Standard*: The development of oil has commenced on the mesa between Westminster and the ocean. On the Northam ranch a well is down 900 feet. On the Bolsa Chico Gun Club game reserve a well has been started, the first work being done this week. Other test wells are talked of in that section. Much secrecy has been observed and endeavors made to keep the plans for development quiet. The development commenced is due to that at Newport beach.——Several locations of mining claims have been filed in the county records lately and it is said prospectors are numerous in the mountains. J. Yeager, C. Duessort, J. Hanson and F. Gomez have filed a claim in Lucas canyon named the Four Nations. The ore is reported to carry silver.——The Lone Horse mine was filed May 15th. It is in the same canyon; the owners are Yeager & Duessort.——The Three Nations mine, in the same locality, fifty-three acres, was filed a week ago. The partners are F. Gimea, S. H. Finley, R. McFadden, A. Deface, D. Serey, J. Serey, W. Schermer and J. J. Schermer.

Placer.

(Special Correspondence).—In the Eureka Con. drift mine near Forest Hill the prospect work has resulted in striking the rim of the channel at a lower point than that reached several weeks ago. The wash contains many large boulders and much water. It will be several days before much definite information can be had. This work is in charge of F. Chapellet Jr.

Forest Hill, May 20th, '99.

Auburn *Republican*: C. F. Hollen of San Francisco recently leased the Boulder mine of C. C. Handy of Ophir, and leased the Line mine on Auburn ravine, below Auburn, of J. Malmburg. Mr. Hollen is representing the Alliance Experimenting & Mining Co. of San Francisco.— B. F. Hartley is in charge of the Bear River G. M. Co.'s property, on Bear river, above Colfax. A hydraulic elevator is being put in and work will be done on the river this summer. The company is composed principally of Englishmen who have purchased several miles of river bed.

San Bernardino.

Yuma *Sun*: J. E. Doan of Los Angeles is making arrangements for opening a copper mine near the Colorado river, twenty-five miles above Parker. The group of mines consists of fifty-six claims, on which several hundred feet of development work has been done. ——C. H. Gray, L. Gray and B. Gray are about to build a mill on the Arica mines, in the eastern part of this county opposite Ehrenburg, Arizona. There is a quantity of ore on the dump.

San Diego.

L. E. Aubury is at Picacho, where he is putting in a cyanide plant, which will be ready for operation in about two weeks.

San Diego *Union*: The seventeenth report of Receiver C. W. Pauly of the Golden Cross mines has been filed in the Superior Court. The report covers the operations for the month of March and states that the cleanup on March 31 from the 100-stamp mill amounted to $18,817.07, the expenditures to $30,656.27, which included a payment of $11,500 to J. Spiers in accordance with a stipulation filed in court. The payroll for the month amounted to $6000. After making all payments the balance on hand amounted to $22,078.78.

Santa Barbara.

Santa Barbara *Press*: The report that the Carpinteria and La Patera asphalt mines are to close down is denied. The Sisquoc-Alcatraz refinery will not be able to fill all of the orders now in, until the new machinery is placed and in working order. When the Sisquoc plant is established the company will be able to produce asphalt at less cost than at present from the Carpinteria and La Patera mines. La Patera will be abandoned this fall, unless new deposits are found closer to the surface, as the working level is now down 400 feet and must go deeper. During the winter rains it is almost impossible to work in the shafts because of water. The Carpinteria mines and refinery are not likely to be closed down for several months. It is reported that the plant at Sisquoc and Alcatraz will be increased to four times the original capacity.

Shasta.

(Special Correspondence). — At a regular meeting of the Board of Directors of the Mt. Shasta Gold Mines Co., Ltd., held May 15th, a dividend of $6000 was declared, being the first dividend of the company. The mines are located at Shasta and comprise thirteen claims, about 250 acres of land. The capital stock of the company is 100,000 shares, of a par value of $5 per share. The mine is working from sixty-five to eighty men and ships its ore to the Keswick smelter. The ore has averaged $40 per ton to a depth of 300 feet. Stoping is in progress on the 200 level, and a station has been cut out on the 300 level from which drifts are being run. The mine has earned $26,000 over operating expenses since the present owners purchased it in July, '98, $20,000 having been invested in equipment and development of the property and in paying the balance of the purchase price. The mine is now free from debt and on a regular dividend-paying basis. The officers of the company are: O. O. Howard Jr., Pres. and Treas.: F. E. Ware, Vice-Pres. and Gen. Mgr.; H. A. Ladd, Sec. Howard & Ware own nearly all of the stock of the company.

San Francisco, May 18th, '99.

A retaining dam built on Harrison gulch to impound tailings from the Midas gold mine broke on the 18th inst. and a large amount of tailings, estimated to contain $60,000, ran down the canyon and were lost.

Sierra.

A. Jacobson has leased the Berger mine and has been following a small streak of ore. A couple of weeks ago it began to widen; it is now 3 feet wide and rich. He has six men employed.

It is reported that more extensive works will be added to the Butte mine.

W. Thompson is working his brother's gravel mine in Ladies' canyon.

Downieville *Messenger*: L. Morrison is working his gravel claim in Hog canyon.—— At the Comet mine in Jim Crow canyon seven men are employed.——It is reported more extensive works will be added to the Butte mine.——I. Copeland has completed cleaning and enlarging the Gold Bluff ditch, has started up the mill and resumed work in the mine.

Siskiyou.

Yreka *Journal*: Mr. Plummer has discovered a vein at the head of Dutch creek which assays in copper, with little gold and silver. It is capped with iron. Dutch creek has produced considerable gold, especially at its junction with Klamath river. In the Klamath, where it empties, the richest pay was found in the bedrock gravel, supposed to be the output of Dutch creek.

Yreka *Journal*: Mr. Lewis has made a strike in quartz on a hill near the Goodale ranch at the lower end of Scott valley. The extent of the ledge has not been developed. Claims have been located all around that section. It is near the Sheba mine of Patterson creek, and mining fields of Oro Fino, Mugginsville and Quartz valley.——The Yreka M. Co., successors to the Blue Gravel Co., at Greenhorn creek, a mile south of Yreka, took out $500 the last cleanup. The upper riffles are cleaned up every day, and on Sundays upper and lower riffles are taken up. J. Garvey is foreman.——The Directors of the Golden Star M. Co., working the Spencer quartz mine on North Fork of Humbug creek, have levied an assessment of 1 cent per share. The prospects since striking the ledge in the lower level are encouraging.——Hunter & Co. intend running a tunnel 1500 feet into their Cherry Hill quartz mine on Cherry creek, and will use power drills.——Owners of patented land between Yreka and the Forest House are endeavoring to join in prospecting the quartz ledge lately discovered. This ledge is on the hillside west of the Scott valley road, and runs towards the North Fork of Greenhorn.

Solano.

The St. Johns quicksilver mine, five miles from Vallejo, is to be reopened, after years of idleness, by a company organized by A. Tregidgo, formerly of Grass Valley. He is to be Supt.

Trinity.

Redding *Free Press*: G. L. Carr has a lease on the Yellow Rose of Texas mine, situated on the head of Union creek, at an elevation of 7000 feet. Union creek is a tributary of Coffee creek. The Yellow Rose is owned by Amos Hill. He expects by June 1st to commence shipping ore to Selby.——H. C. Woodrow, who has bonded the Trinity mine of the Bank of Shasta County, has a force of men at work.——Landers & Fisher shipped a carload of ore to the Keswick smelter last week and are ready to ship another.——Hicks & Co. of Castle Garden are making improvements in their cyanide plant and will soon be ready to run. They have completed two 40-foot tanks. They have let a contract for running a 100-foot tunnel on their ledge.——Moore & Nordstrom at Bragdon have received returns of gold taken from black sand of $36.07 per ton.—— Johnson & Kirke on McCall gulch are keeping a Huntington mill running. Mr. Chris of San Jose is amalgamator.

Tulare.

The asbestos mine recently discovered in this county and owned by Drouilard & Helm, promises to be a paying property. It is reported a New York firm has offered $75 a ton for all the asbestos the mine will furnish.

Tuolumne.

(Special Correspondence).—The Miners' Association of Tuolumne county, a branch of the California State Miners' Association, was organized, with headquarters at Sonora, on the 20th inst. The meeting was called to order by W. C. Ralston, Vice-Pres. of the State Association. W. H. McClintock of the Goldwin M. Co. was elected temporary chairman and C. R. Thorburn temporary secretary. The chair appointed a Committee on Organization, which reported later, and the following officers were elected to serve for one year: W. H. McClintock, Pres.; C. R. Thorburn, Sec.; J. McCormick, Treas. An executive committee of twenty-one was appointed by the Pres. Addresses were delivered by E. H. Benjamin, Sec. State association, and W. C. Ralston, and telegrams were received from Hon. Jacob Neff and John F. Davis of Amador county, regretting their enforced absence. All of the prominent mother lode and east belt mines were represented, and seventy-five members were enrolled. The meeting was largely attended and it is predicted that the association will number 1000 members before the next annual meeting. C. R. THORBURN, Sec.

Sonora, May 20th, '99.

The Junction mine, near Soulsbyville, has been closed down and the pumps withdrawn. The development of the vein to a depth of 300 feet with drifts and crosscuts, aggregating about 1000 feet, has failed to disclose anything of value.

COLORADO.

GUNNISON COUNTY.

(Special Correspondence).—In the last three weeks many good strikes have been reported. The strike in the Venable has now been far enough determined to say that it is one of the most notable strikes ever made in the State. The rich ore is 9 feet in width, and from numerous tests made is found to average $200 per ton. Drifts have been run each way on the vein. This mine has 20 feet of good mill ore beside the 9 feet of high-grade.

The Comet, on the east end of the Venable property, has had several good offers of purchase, ranging from $20,000 to $50,000, with only a 20-foot hole on the same vein as the Venable.

The Iron Cap comes next, east of the Comet, and will command a good price. It is as promising as the Venable was, has two patented claims and 650 feet of development work, consisting of 135-foot shaft and three levels, beside a good shafthouse, hoist, 5-stamp mill

and other improvements. The property is under option for $15,000, which is one-fourth of its value.

The Woodland Co. own several promising claims north of the Iron Cap which they are preparing to develop. Numerous new locations have been made since the strike on the Venable, and many of them make an excellent surface showing.

The Diamond K has sent out a carload of ore, being its first shipment.

Word has come of a strike on the Humboldt, near the Vulcan. The value or extent of it has not been learned.

Some rich ore was brought in to-day from the Good Hope, showing sylvanite, and worth several dollars per pound. This ore was struck in the 300-foot level, and is the finest ore shown in this camp. Other properties working will also make records for themselves soon.

This week I visited the Riley property, where ore on the dump and in the bins amounts to seventy-five tons, and they expect to sort it roughly, making two grades, one for mill and the other smelting. It is thought the latter will run $200 per ton and the mill rock $20. I found the vein opened for a distance of 3000 feet at various places along the vein, which has a width of over 1 foot. The vein matter is white quartz, with a small amount of iron and copper and considerable nagyagite, a sulpho-telluride of lead and gold. Many pieces of ore show free gold. The quartz is found in a large mass of changed quartzite, which is soft and the cleavage faces stained with iron oxide. This property is one of promise, on account of the large bodies of rock, which make good milling ore, adapted to cyaniding.

The Midland is one-half mile farther to the south. They have started up with twelve men and are developing rapidly. They have 3 feet of shipping ore that will run $100 per ton, beside 20 feet of low-grade mill ore.

Mr. Chinoworth has arrived and will start work on his property at Du Boise, where he has a tunnel 150 feet and a crosscut which shows 40 feet of ore running from $4 to $7. He says he has not cut the other wall and does not know how much wider it is. At almost every property being developed in the gold belt of this county large bodies of low-grade mill ore are associated with high-grade streaks.

Gunnison, May 16th, '99.

LAKE COUNTY.

(Special Correspondence).—After a winter of considerable depression occasioned by snow blockades, the mining industry at Leadville is again assuming its normal condition, with prospects of a tonnage output for '99 far greater than that of '98.

The down-town mines, comprising the Weldon, Bon Air, Penrose, Bohn Shaft, Starr, Sixth Street, Coronado and Northern, which were full of water for two years, are now unwatered and have pumping facilities to keep them dry. The Weldon is to be operated by the Weldon M. Co., who are the owners; the Bon Air, Penrose and Starr by the Home M. Co. of Leadville, as lessees; and the others likewise by lessees. It is estimated that within six weeks from now the entire group of down-town mines will be at work producing 300 to 600 tons of ore per day. These are the original lead-carbonate mines, whose shafts are from 400 to 600 feet deep. The workings pass through a stratum of oxidized iron ore, thence into the carbonate contact 8 to 20 feet thick on the average, trending northeasterly and southwesterly and dipping about 15° toward the north and east. This carbonate contact is between porphyry and lime. At greater depth, below the carbonates, it is believed sulphide ores will be encountered. While these mines have been closed down the production of lead carbonates has been limited to 600 to 800 tons per day for the district.

Farther up the hill the Mab, Mahala and R. A. M. are beginning to produce their normal tonnage. The ores from these are largely sulphides, the values being in gold, silver and lead.

On Breese hill, higher up toward the crest of the Mosquito range, is the Ibex group, the central figure in the sulphide gold belt of the district. This is now under the management of S. W. Mudd. The Ibex, locally known as the Little Johnny, is producing about 300 tons per day, and it is claimed the purpose is to raise this to 500 tons, as they have the ore and facilities to do so. The Breese hill gold-belt ores generally carry values aggregating $25 net per ton, of gold, silver, lead and copper, these metals being named in the order of their importance as here produced. The Ibex ores are silicious.

On Little Ella hill, across Evans gulch, are the Resurrection, Sedalia and others, whose ores are largely lead carbonate. The Sedalia is not working. The Resurrection is operating and will increase its output to 200 tons per day. The owners are to erect a concentration mill.

On Fryer hill several properties are being worked by lessees. At the head of Big Evans gulch the Dolly B. is shipping fifty tons per day and the Lydia and Monarch are at work. In California gulch the A. Y. and Minnie is shipping its usual quota under lessees; the Moyer is shipping 200 tons per day. The ores from this part of the district are low-grade sulphide, carrying iron and silver. From the same gulch the Yak tunnel, now in 1¼ miles, is driven with three shifts. Its destination is the grounds of the Ibex Co.

On Printer Boy hill, in Iowa gulch, shipments by lessees amount to considerable. The Nisi Prius, on Rock hill, between Iowa and California gulches, recently made a strike of high-grade carbonate ores.

The daily production in Leadville district, not including the prospective output of the down-town mines, aggregates about 2000 tons.

Leadville, Colo., May 20, '99. WASCOTT.

TELLER COUNTY.

(Special Correspondence).—L. O. Byrer and others, operating the Guess on Squaw mountain, recently took out forty tons of four-ounce ore.

The Ajax, on Battle mountain near Victor, is operating and shipping with a new hoist, compressor and shaft house over a 450-foot shaft.

The Economic Gold Extraction Co., a subordinate concern of the Gold Coin M. Co. of Victor, is making progress with the construction of the chlorination plant on the Arequa side of Squaw mountain. The plant is being built in two sections, the machinery for one section being on the ground. The plant, complete, will have 600 tons per day capacity. The site of this mill is near the entrance of the Columbine tunnel which cuts through Squaw mountain and passes into the Gold Coin grounds on the opposite side. The tunnel is 3700 feet long, through which Gold Coin ore will be delivered to the Economic Extraction mill by electric haulage. By track this mill will be connected with the Uinta tunnel and other properties in upper Arequa gulch which are controlled by the Woods Investment Co., principal owners of the Gold Coin mine.

The Independence Town & Mining Co., owners of a thirty-eight-acre tract on the southern slope of Bull hill, originally known as the Hull City placers, are completing improvements costing $75,000, consisting of heavy abutments and stone filling, ore house, shaft house, hoisting and compressor machinery. Their new steel gallows-frame and steel frame shafthouse are the first of the kind in the district. The main shaft is 560 feet deep, there being five other shafts on the property. The vein opened for 1000 feet runs north and south. It is stated that $800,000 has been produced from this property within the last eighteen months and that the average value of the ore has been $60 per ton. It is estimated the property will produce 100 tons of ore per day when the new machinery shall be set to work.

Dr. Crane of Cripple Creek is operating one of his washers on the dump of the Garfield-Grouse on Bull hill. It operates as a sizer, screener and washer, and handles about 100 tons per day of the material that runs $5 to the ton. The motive power is gasoline.

The Damon tract of twenty-one acres, on the northern slope of Bull hill, was brought into prominence by the Alert G. M. Co. which had a lease on a portion of the tract. This company struck the vein 7 feet from the surface some time ago, since which time they have shipped several cars of high-grade ore. The vein is sylvanite ore from 1 to 12 feet wide. Now the ground is all leased and that part of the district is looked upon with favor. The Damon belongs to J. R. McKinney, Woods Investment Co., W. Lennox, J. M. Hawkins, and others.

The Teutonic, which adjoins the Damon, is in the hands of active lessees and has fine prospects. WASCOTT.

Victor, Colo., May 18th, '99.

(Special Correspondence). — The Midget mine on Gold hill is being developed under the superintendency of R. A. Trevarthen. It is shipping 100 tons per month to the cyanide mills at Florence. It is stated the ore averages three ounces gold to the ton. The main shaft is 500 feet and No. 2 shaft is almost as deep. The two are to be connected at the 600 level and a heavier hoist put in. By cross-cutting from the main shaft at the 400 level four other veins have been opened.

The Work M. Co.'s properties comprise four claims on Raven and two on Gold hill, aggregating forty acres. There are sixteen working shafts. Ore shipments have amounted to 600 tons since Jan. 1st, '99, all of which have been taken to the cyanide mills, the average values being $30 per ton. The deepest workings are 450 feet from surface. L. A. Hayden is Supt.

The cyanide and chlorination mills at Colorado City, Florence and in Cripple Creek district handle 23,000 tons of ore monthly and it is estimated that 8000 tons per month are shipped to the smelters. The mill ore averages $28 per ton and that treated by the smelters not less than $100 per ton. This indicates for the smelting ore a valuation of $800,000 and for milling ore $644,000; a total value per month of $1,444,000.

It is learned that some mills get a higher grade ore than others. It is asserted that the ore handled by the Metallic Extraction Co. averages $20 to $23 per ton; that of the Colorado-Philadelphia plant at Colorado City, $35 to $40 and that of mills in the district $28 per ton.

The reduction works of the National Gold Extraction Co. at Florence will soon be in operation. This plant was formerly known as the Kilton. Its capacity is 100 tons per day. The mills handle ores as low grade as $8 per ton. It is believed that the general values of ores of the district are running about the same now as they did three years ago—they are not lower. WASCOTT.

Cripple Creek, Colo, May 19th, '99.

IDAHO.

Hailey *Times*: The Tip Top mill is nearly completed, it has twenty stamps of 850 pounds each, will make ninety drops a minute and crush fifty to sixty tons of ore per day. The process will be free-milling and automatic.

Wardner *News*: The Bunker Hill Co. is employing 120 men. The ruins of the mill have been cleared away and the erection of the new mill will be commenced as soon as possible. T. Mitchell, formerly of Gem, is preparing the plans for the new concentrator. The ground is covered with frame timbers.

Boise *Statesman*: E. N. Clark, who spent the winter in Mallick district, says it will be an important sub-division of the Buffalo Hump section. The Star group, upon which the De Lamar Co. has an option, is the best developed mine in camp. The croppings assayed $15.45 a ton. At a depth of 70 feet the ore runs as high as $70 in gold and forty ounces silver. Thirty-six feet of ledge matter has been cut without a wall. There are a number of claims that give promise. Mr. Clark has an extension of the Star; 150 to 200 locations have been made. On Bull creek, three miles down the river, some good mines have been discovered.

MONTANA.

There is activity at Libby owing to increase in the force at the Libby Creek M. Co.'s property on Shaughnessy hill, heretofore known as the Buzz Saw group, which have been operated by the United States & British Columbia M. Co. under a bond for six months, and the first payment of the price paid. The company has erected a sawmill on Granite creek, a mile from the lower tunnel on the Buzz Saw mine, and is cutting lumber for the concentrator, offices, bunk house and stables, and for a three-mile flume from Granite creek to the concentrator. The flume will develop 500 H. P. at the mill. The concentrator will have a capacity of 100 tons and will be running by August. The mine is developed by seven crosscuts, has 2000 feet of work and the longest tunnel is 550 feet. The ore body is 1300 feet in length and the vein is 4 feet. The values are in gold, silver and lead. The average of the ore is $11 a ton. The mine is eight miles from Libby and thirty men are employed at the mine. J. M. Dikeman is Supt. The company will spend $80,000 before the mill is started.

At the Snowshoe mine the force is being increased. There are now employed 100 men. The tunnel is in 1500 feet and being driven at the rate of 8 feet a day. An air compressor has been put in.

Work has continued on the Silver Cable the past winter and 500 feet of tunnel has been run. This claim is operated under bond by F. M. Leonard of Libby. The mill has a capacity of 100 tons a day and is ready for operation.

Eastern parties who have an interest in the Brick & Brannagan properties on the West Fisher are making arrangements for transportation of a mill which is on the way from Libby to their mines. Twenty miles of wagon road must be built before they can get their machinery from Libby to the mines.

There is other work going on in the Fisher district and arrangements are being made for another mill on an adjoining group.

NEVADA.

The Robust mine, near White Pine, is preparing to ship ore to Salt Lake. A body of copper has been found in the 70-foot and 100-foot levels, from which a shipment was made to Salt Lake. This ore is a separate vein, crossing the gold vein, and carries from 25% to 50% copper. Little work has been done below the 70-foot level, owing to inadequate hoisting facilities. The company has acquired several additional claims adjoining the Robust group, on which they have two men prospecting.

The Rocco-Homestake M. Co. has been incorporated in San Francisco, Cal., to operate the Homestake lead mine in White Pine mining district, with their head office at San Francisco. Deeds have been recorded for the transfer to the company of a one-quarter interest in the Homestake mine by O. J. Smith and M. D. Smith for $3000; one-twelfth interest by R. M. Clark for $1000, and the remaining two-thirds interest by Rocco Cragnaz for $8000.

OREGON.

A discovery of gold has been made in Jupiter gulch, on the east fork of Upper Althouse creek, adjoining the Frank Houston mine. Jupiter gulch is a part of the Jupiter G. M. Co.'s property on Althouse creek and is located at the foot of French peak, a porphyry mountain. The porphyry is seamed with small stringers of gold-bearing quartz and manganese, and this newly discovered gulch, like Houston's, derived its gold from pockets in the porphyry. F. R. Wardle, Mgr. of the Jupiter Co., has been having this ground prospected and has opened a body of fine wash and gravel 1000 feet in length, 5 feet depth and considerable width, all of which prospects.

SOUTH DAKOTA.

Deadwood *Pioneer Times*: The Golden Reward Con. M. & M. Co. has purchased all of the Black Hills holdings of the Deadwood & Delaware Smelting Co. The Golden Reward Co. secured a bond upon the Deadwood & Delaware property over two months ago for sixty days. Dr. F. R. Carpenter, Supt. Deadwood & Delaware Co., and H. Franklin, Vice-Pres. Golden Reward Co., have been in Chicago for two weeks on business connected with the transaction and conferring with the stockholders of the two companies.

UTAH.

Salt Lake *Tribune*: The first carload of copper from the Highland Boy smelter has been started for the refinery of Lewissolm Bros. in New Jersey. The bars contain copper, gold and silver. The shipments of bullion will be made weekly.——The washing of gravel at the property of the Bingham Placer M. Co. in Bingham canyon has begun under the direction of Mgr. Schenck, the raising of dirt to be from a depth of 125 feet, where the upper channel has been opened. It is the intention to handle 200 yards daily. —— Sam Gilson has found the lost vein on the Buckhorn mine at Dugway in the Deep Creek country, and is again raising high-grade ores. The Buckhorn is among the earliest of the mines of Deep Creek. Its ores yielded hundreds of ounces in silver per ton.

WASHINGTON.

At the properties of the Okanogan free gold mines, formerly known as the Allison group, near Oro, on the surface the ore is a soft sugary quartz, and is oxidized to a depth of 30 feet, as shown in the workings. It is honeycombed in places, and in the cells the free gold is visible to the eye. The specimens of this class of ore lose much of the gold, as the metal is loose in the cells and easily drops out. There are stringers of sylvanite running through the quartz. The average in the pay chute will run $50 to $60 in gold.

WYOMING.

The Wyoming Development & Transportation Co.'s mines are in southern Wyoming, north of the Colorado State line. The company owns fourteen lode mines and 235 acres of placer ground at Gold Hill, which has been developed since December, '95. One of these, the Acme, is a gold mine. The company also owns and is interested in a number of copper properties in the same locality.

A smelter for the reduction of the copper ores and milling facilities at Gold Hill will be erected.

It is reported the Amalgamated Copper Co. have offered $900,000 for the Ferris-Haggerty mine, near Grand Encampment. The mine is producing and shipping fifteen tons of ore daily.

FOREIGN.

AUSTRALIA.

For the purpose of proving the deep deposits of stream tin which are believed to exist in the Deepwater and Emmaville districts, the N. S. W. Minister for Mines, Hon. J. Cook, has decided to offer the miners assistance as an inducement to proceed to work. Previous attempts have been unsuccessful, owing to need of pumping machinery, beyond the reach of prospectors. The shallow ground is to a large extent worked out.

The gold production of Australia for the first quarter of 1899 has reached 836,295 ounces, an increase of 133,362 ounces over that of the same period last year. Of this amount, West Australia produced 316,752 ounces; Victoria, 213,847 ounces; Queensland, 205,542 ounces; and New South Wales, 100,153 ounces.

BRITISH COLUMBIA.

Sandon *Mining Review*: The Manitoba claim at Silverton has a 6-inch paystreak.——The lead has been struck on the Lamont claim at Silverton.——No. 2 tunnel on the Emily Edith is in 500 feet and in good ore.——They have fourteen men at the Wonderful and a lower tunnel has been started.——The Arlington at Slocan City will begin operations.——The Queen Fraction on the Noonday lead of the Galena Farm is looking well.——T. Mitchell, now at Wardner, Idaho, will commence work on the Ruth mill.——P. J. Hickey's gold mine at Camp McKinney is proving to be one of the best silver-lead properties in the country. It also carries good values in gold.——The contractors are working at the Selkirk. Good mineral——gray and peacock copper—has been found.

CANADA.

Copper is found cropping on the surface over a tract of land in Chandos, Province of Ontario. It is reported that it gives promise for deep and permanent mining on a large scale. The Colonial Copper Co. has secured 416 acres of this land, situated in Peterboro county, township of Chandos.

LOWER CALIFORNIA.

The new placers 400 miles south of San Diego, until now known as the Santa Clara diggings, cover twenty square miles and are said to be rich. The principal workings have been upon and around a mountain called Cerro Pinta, and by this name the placers are known to the Mexicans. The pay is found 6 inches to 2 feet beneath the surface, and in all directions from Cerro Pinta hundreds of Mexicans are reported to be taking out all the way from $4 to $20 a day with dry-washing machines. Water in any quantity is twenty-one miles distant. The gold is .982 fine. There are many little nuggets in the gold. It is reported that $10,000 has been received at San Diego. Water is found in small quantity six miles from the placers. Heretofore miners wishing to take a claim at the placers have had to send or go across the peninsula to Mulege, but an agent of the Government from Mulege will locate at the camp.

San Diego *Union*: A large consignment of machinery has been shipped by way of Tia Juana for La Fortuna and La Republic M. Cos. The principal stockholders of La Fortuna M. Co. are Eastern men, with H. A. Howard of San Diego Mgr. The mines are at Agua Dulce, 100 miles southeast of San Diego and sixty miles east of Ensenada. La Republica M. Co. was recently organized by Mr. Howard and A. L. Wright of San Diego, with Mr. Wright as Mgr. The mines are near La Huerta, in the Agua Dulce district. The value of the machinery and supplies cleared through the Tia Juana custom house was $20,000.

MEXICO.

Samples of gold-bearing ore have been brought into Yuna from a group of mines in the Cocopa mountains on which General Andrade is having development work done. The ledge is large and close to wood and water. It is reported a mill will be built.

SOUTH AFRICA.

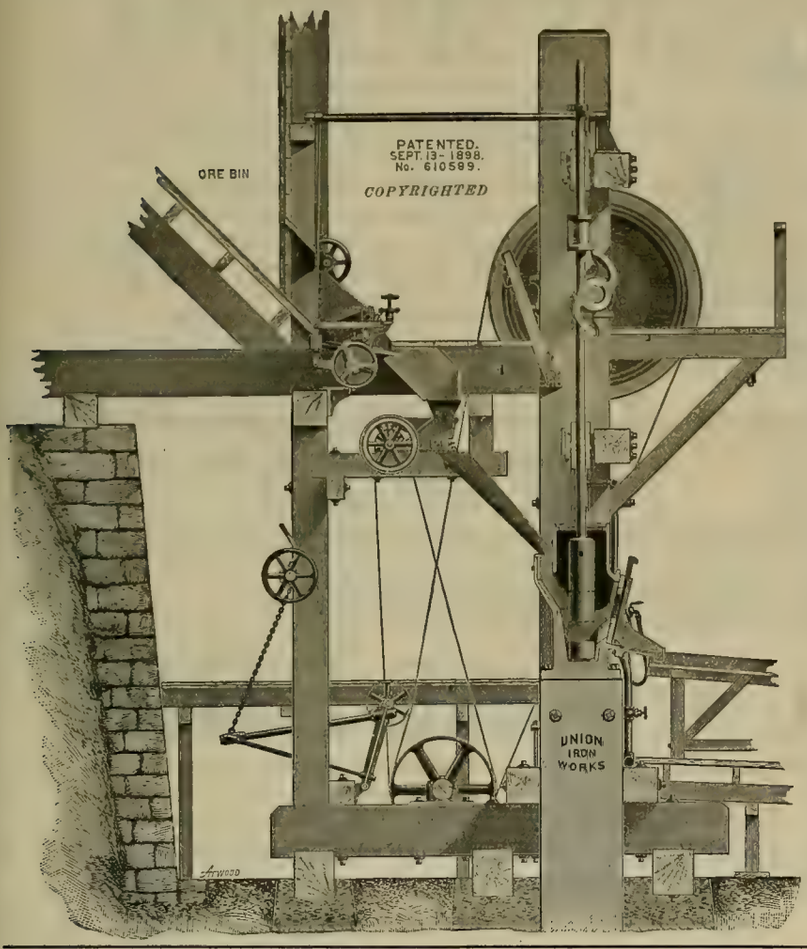
Johannesburg *Mining Journal*: A strike of conglomerate is reported in the Knight Central, which runs 11 pennyweights.——The capacity of the Van Ryn Gold Mines Estate is to be increased forty or sixty stamps.——In the Alexandra Estate at Johannesburg an important strike in a sandstone reef is announced.——Twenty stamps are to be added to the mill of the Aurora-West, united.

TASMANIA.

Australian *Standard*: Six smelters are now in operation at the works of the Mount Lyell M. & R. Co., the sixth being blown in last week. —— A satisfactory development has taken place at the North Mount Lyell Con., where good ore is exposed on the eastern sections of the property.——The Lyell Proprietary mines, known lately as the Great Southern, have prospected a deposit of native copper on their northern lease, near the Mount Lyell Consols.——At Mount Jukes and Mount Darwin a number of local companies are prospecting. The King Jukes crosscut is in ore, and work is being pushed in the Mount Jukes Proprietary, where high-grade ore is showing.——A discovery of copper similar to the ore in the Prince Lyell is reported in the Mount Lyell Reserve, on the section north of the North Mount Lyell Con.'s lower block.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

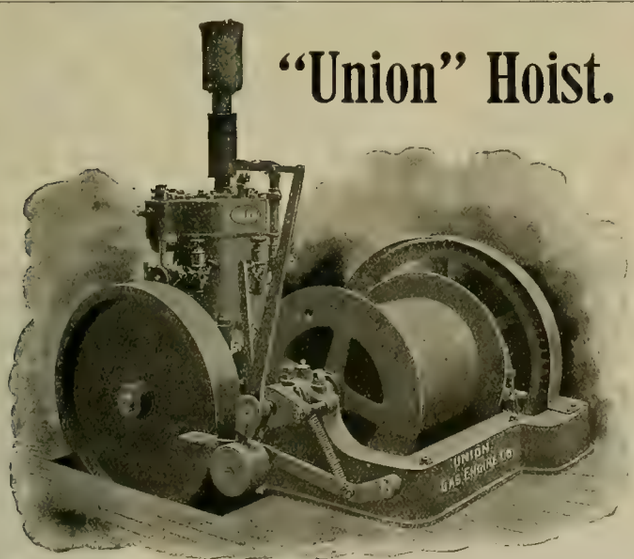
We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS — 20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

WHITE, ROGERS & CO.,

Constructing Engineers and Contractors,

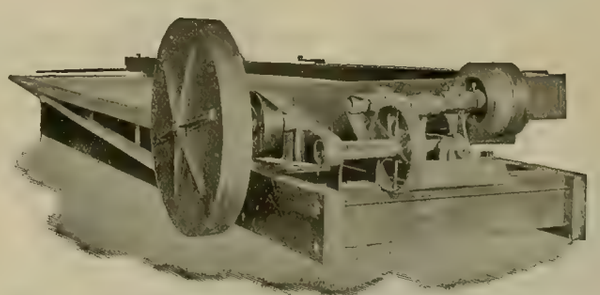
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

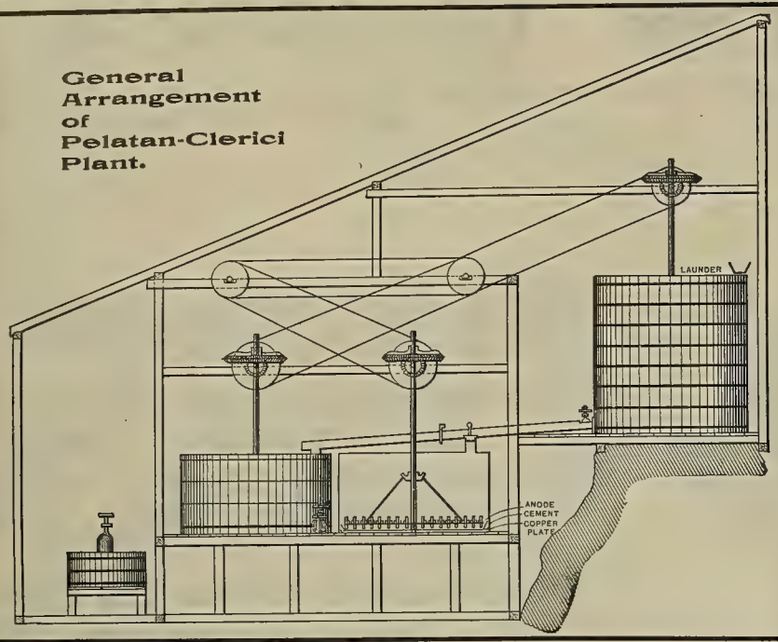
PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

We furnish superior Machinery and erect Stamp Mills, Hoisting and Pumping Works operated by Steam or Water Motors. Complete Concentrating and Smelting Plants for the concentration and recovery of gold, silver, copper and lead. Improved Power Drills and Air Compressors, Wire Rope Tramways, etc.

—SEND FOR CIRCULARS.—

These Machines are Kept in Stock Ready for Immediate Shipment.



General Arrangement of Pelatan-Clerici Plant.

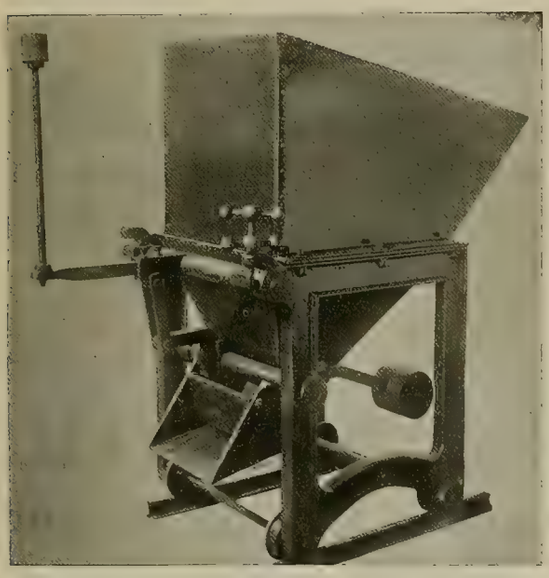
The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

THE RISDON IRON WORKS,
SAN FRANCISCO,
AGENTS.



No. 20.

OUR VERY LATEST!

A NEW ORE FEEDER.

ABSOLUTELY NOTHING TO GET OUT OF ORDER AND MEETS THE REQUIREMENTS OF THE MOST EXACTING CONDITIONS. A POSITIVE AND AUTOMATIC FEED FOR ALL KINDS OF ORE.

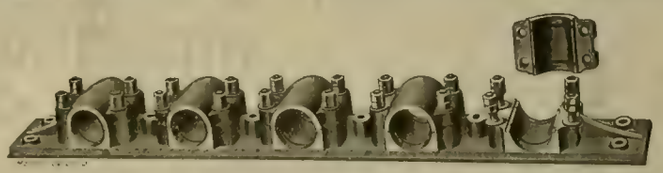
DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

GLOBE PATENT Battery Stem Guide.



(PATENTED AUGUST 24th, 1897.)

ALL IRON. NO WOOD OR BABBITT METAL.

PATENTS OBTAINED IN ALL CIVILIZED COUNTRIES

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE
Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,
Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

P&B ROOFING

ROOFING is to a building what clothing is to the body. It must protect and it must wear well. To put money in an interior and to save it on the roof of a building is poor economy.

P & B ROOFING possesses all the requirements of a first-class roof covering. It is waterproof, durable, inexpensive, easily laid. Ask your dealer for a circular, or address the makers.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

BADGER HILL AND CHEROKEE GRAVEL MINING Company.—Location of principal place of business, San Francisco, California; location of works, Cherokee, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of May, 1899, an assessment of Three Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1899, an assessment (No. 18) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 17th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of May, 1899, an assessment (No. 13) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of May, 1899, an assessment (No. 19) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3rd day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1899, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 11th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

DELINQUENT SALE NOTICE.

HEAD CENTRE CONSOLIDATED MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Tombstone Mining District, Cochise County, Arizona.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 7) levied on the 20th day of March, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
H. B. Parsons, Trustee	108	100	$20 00

NOTICE.

SALE OF THE BUNKER HILL AND MAYflower Mines, Amador, Amador County, Cal., by the Receiver of the Spring Garden National Bank of Philadelphia, Pa.

Public notice is hereby given that the mining properties known as the Bunker Hill and Mayflower Gold Mines, situated near Amador, in the County of Amador, State of California, on what is known as the "mother lode," belonging to this trust, will be sold at public auction, together with all water rights and privileges, mill sites, hoisting works, railroads and rolling stock, buildings, machinery and appurtenances belonging thereto, at the United States Custom House, San Francisco, California, THURSDAY, June 8, 1899, at 11 o'clock A. M.

Circulars containing general description of the property and particulars as to conditions of sale, etc., furnished on application to

J. FRANK ALDRICH, Receiver,
Room 33, Wyatt Building,
Washington, D. C.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the NATIONAL CON. MINING CO. will be held at the office of the Company, 773 Mission St., San Francisco, California, on MONDAY, the 5th day of June, 1899, at the hour of 8 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, HAVing received applications to mine by the hydraulic process from J. H. Southwick, in the North Hill Placer Mine, near Milton, Calaveras Co., to deposit tailings in Rich Gulch; from T. B. Bennett, in the Ohio Mine, near Wash. Plumas Co., to deposit tailings on a flat below the mine; from W. E. Duncan, Sr., in the York Ranch Placer Mine, near Spanish Ranch, Plumas Co., to deposit tailings on a flat below the mine; and from Alfred Schofield, in the Klondike Mine, at Whiskey Diggings, Sierra Co., to deposit tailings behind the dam of the Washington Mine in Slate Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on June 12, 1899, at 1:30 P. M.

THE

"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

The Santa Rosa Mine.

The Santa Rosa hoist and mill, situated six miles west of Perris, in Riverside Co., Cal., are illustrated below. This vein, which occurs in granite, was worked to water level by Mexicans in early days, the ore being crushed in numerous arrastras in neighboring gulches. When the primitive methods of the Mexicans reached their limit the mine was abandoned and remained idle for many years. In 1894 a company was organized to reopen the mine and a large amount of money expended in plant and development, but for some reason the operations were suspended and the mine closed down. It is now reported that the mine is to be reopened under new management, the cyanide process introduced and success is anticipated. Southern California as well as the northern part of the State has numerous monuments to the folly and inexperience of operators of earlier days, and there are already instances of success being achieved under competent management where in former years disastrous failure marked the career of these enterprises. A notable instance is that of the Good Hope, a few miles from the Santa Rosa, an illustration of which appeared in the issue of May 20th, '99. Success is now being made at the Good Hope by leasers where a corporate company failed signally. There is no reason to anticipate anything but success for the Santa Rosa if it is properly managed.

A Mojave Desert Prospect.

On the Mojave desert, several miles from the railroad, in San Bernardino Co., Cal., is the Royal Rock mine, an engraving of which appears on this page. The ingenuity of the owner is displayed in the remarkable looking structure standing in the background. It is a horse whim of home-made design and construction, and with it an inclined shaft was sunk 200 feet deep on a vein of gold-bearing quartz. Prospectors on the desert are sometimes taxed to the extreme limit of their inventive faculty to meet contingencies which arise. In this case the miner seems to have successfully solved the problem of providing a hoisting rig when unable or unwilling to purchase expensive machinery. The whim shown in the illustration is constructed wholly of light lumber and is strengthened by ingenious bracing. His cabin in the foreground is constructed of short boards, poles and desert brush; his fireplace and chimney of rocks, and his blacksmith shop is practically out of doors. A few poles supporting a light roof give shelter from the rays of an unrestrained sun, for clouds rarely appear in that region. The entire camp illustrates simply how a prospector with little or no means, but with a willingness to work, can overcome many difficulties and accomplish his aim—the development of his mine.

THE IRON ROD MILL, SILVER STAR, MONTANA. (See page 584.)

The Iron Rod Mill.

The above engraving is that of the Iron Rod mill at Silver Star, Montana, the first mill in that State in which a success was made in the treatment of auriferous slimes. On page 584 will be found the first of a series of articles on cyaniding slimes, which will give more than a passing interest to the illustration. The ultimate success achieved at this establishment fully demonstrates the necessity for close and careful attention to small details in cyanide experiment and in mill practice. The cyanide process is always an experiment at first. There are no fixed rules which will apply in all cases, due to the great variety of conditions under which the gold is found, which always necessitates a new series of experiment.

The Occurrence and Origin of Diamonds in California; How Soon Copper Ore Turns into Iron; Convention of the California Water & Forest Society; Death of A. T. Dewey, 586. Latest Mining and Metallurgical Patents, 587. Water Development; Zinciferous Ores at Leadville, Colo., 588. The Old Telegraph Mine, Utah; Chloride of Zinc; Some Characteristic Mines of the Gold Belt, 589. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 592. Industrial Notes; Recently Declared Mining Dividends; Recent Mining Incorporations; Commercial Paragraphs, 606.

SILVER is again at 61 cents per ounce, having recovered the slight decline of a few days ago.

NEARLY 100,000 persons are directly dependent on the mining industry in the State of California.

SEVERAL mining States now have departments of mines similar to the State Mining Bureau of California, which is believed to have been the first institution of its kind in the United States.

AT Leadville, Colo., the impression seems to be that there will be no trouble over the eight-hour law, as most of the managers will allow the law to go into effect without protest or any attempt to reduce wages.

PRICES of the various kinds of iron have slowly but steadily advanced until the highest price ever paid for some kinds has been reached and no prospect for a lower price. Every furnace in the country that is in condition will be put into operation.

THE past week has seen another generous rainfall throughout the State of California, which will be of general benefit to miners. Up to this time the rainfall and snow in the Sierras has not been sufficient to insure a continuous season's work.

MRS. LELAND STANFORD of San Francisco has transferred all of her vast fortune, estimated at $35,000,000, to the trustees of the Stanford University at Palo Alto, Cal., in trust for the benefit of that institution. This makes that fortunate college one of the wealthiest in the world.

ACCORDING to the statement of English papers, W. S. Stratton did not receive $10,000,000 in coin for his Independence mine, but accepted in lieu thereof 1,000,000 shares of stock in the corporation organized to operate the property, credited fully paid. If this arrangement is satisfactory to Mr. Stratton it should be to all others, who are in no way interested in the mine.

THOSE who make a study of the distribution of gold as it comes into the channels of commerce from the mines year by year are unable to account for the large apparent discrepancy between the coinage of a year ago and the gold produced since then. The only manner in which they can satisfactorily account for this loss of gold is its use in the arts and in personal decoration, in the way of jewelry, etc.

A WELL KNOWN mining engineer says he always goes about the work of sampling a valuable mine "with fear and trembling," realizing the importance of his decision whichever way he may decide. He says he usually asks the superintendent in charge, in a confidential way, to point out the rich places, trusting to his own observation and judgment to discover the poor ones.

NOVICES in mining too often overestimate the value and extent of their own knowledge and ability. When a new company of inexperienced men is organized to operate a mine, and expensive work is to be undertaken, it will always be wise to employ a thoroughly competent man to at least outline the plan to be pursued. Overconfidence of inexperienced managers has cost large fortunes.

VERY often the investor in purchasing stock of a new mining company is taking a greater risk on the character of the men who control the destinies of the company than on the real value of the mine itself. The man who has lost his money in a legitimate effort to open and operate a mine which proves unremunerative is more easily consoled than he who feels or knows that he had been beaten out of his hard-earned coin by dishonest managers.

A WAVE of almost unprecedented prosperity is sweeping over the country. Industrial enterprises everywhere in the United States are prospering. Iron and steel are booming and with no sign of relaxation. Large contracts are being placed, which tend to insure a continuance of prosperity to the iron branch of the mining industry. Copper has fallen slightly in price, but the slight decline has in no appreciable way affected the demand, which was already large. The wages of employes of numerous large concerns have been advanced and the outlook for the future is promising.

NO PRACTICE in mining, or rather mine scheming, is more reprehensible than that of declaring false dividends. Dividends declared that are not actually and honestly earned are not dividends, and the publication of such is always made with a view to deceiving some one. Of course, stockholders who are not on the "inside" are paid the dividend as advertised. In some cases the proceeds from the sale of stock, boomed by these false dividends, are used in paying the dividends themselves, thereby making it possible to sell more stock.
